

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE.

THE year 1888 was notable in the United States for elections that changed the political complexion of two branches of the National Government, and in Europe for the death of two emperors of Germany. Under the title "United States, Presidential Elections in," the reader will find in this volume a condensed compilation, by counties, of the figures of the last five presidential elections, more conveniently arranged for comparison than such figures ever have been before. In the articles "Harrison," "Morton," and "United States," the other facts of the canvass are set forth. The changes in Germany may be found under that title and in the articles on the three emperors—"Wilhelm I," "Friedrich III," and "Wilhelm II." Other movements, political and military, are recorded in the articles "Abyssinia," "Afghanistan," "Great Britain," "France," "Samoa," and "Zanzibar," the article on Samoa being accompanied by a new map, which shows the harbor secured for the United States. Besides the public works described in the article "Engineering," a most important one is set forth under "Nicaragua," where the reader will find the latest facts about what now appears to be the most feasible plan for a ship-canal between the two oceans, illustrated by a colored bird's-eye view. The "Financial Review" furnishes the usual fine summary of the year's transactions, and the increase of our material prosperity may be further noted in the articles on the separate States and Territories, and in that entitled "Cities, American, Recent Growth of," continued from the two preceding volumes. The most noted deaths of the year, in the United States, were those of Gen. Sheridan and Chief-Justice Waite, on whom the reader will find articles, as well as on their successors, Gen. Schofield and Chief-Justice Fuller, the last-named illustrated by a portrait on steel. Among the other losses of eminent citizens may be noted the Hon. Roscoe Conkling, who was a victim of the March blizzard; the venerable A. Bronson Alcott and his daughter Louisa; Asa Gray, the botanist; Mrs. Lozier, the physician; Seth Green, the pioneer pisciculturist; and Richard A. Proctor, the scientist. The Obituaries, both American and Foreign, will be found to cover a wide range.

Among the special and timely articles are those on "Absentee," "Agnostic," "Atlantic Ocean Hydrography," "Burial Laws," "Balance of Power," "Beds, Folding," "Boats, Collapsible," "Charity Organization," "Camps for Boys," "Co-operation," "Cremation, Progress of," "Congress, Contested Elections in,"

"Diplomats, Dismission of," "Epidemics," "Government Departments," "House-Boats," "Immigration," "King's Daughters," "Lands, Public," "Mining Laws," "Mars, Recent Studies of," "Petroleum," "Sunday Legislation," "Teachers' Associations," and the "United States Navy." Most of these articles are furnished by experts, among whom are Prof. Herbert B. Adams, Willard Parker Butler, Prof. Stephen F. Peckham, Prof. John K. Rees, and Lieut. Raymond P. Rodgers, U. S. N.

Instead of one colored illustration, this year the volume has four—the bird's-eye view of the proposed Nicaragua Canal, and maps of the Territories (soon to be States) of Montana, Washington, and the Dakotas, though the congressional action in regard to these Territories took place in 1889. The three steel portraits include the new President and Chief-Justice of the United States and the young Emperor of Germany. Among the other illustrations of special interest are the new bridge over Harlem river, the moving of Brighton Beach Hotel, the appearance of New York streets after the great blizzard, the Eiffel Tower, the Lick Observatory, the maps of Southern Africa and the Samoan Islands, the new United States cruisers, the series showing evolution of the railway-car, the map of Mars as seen through the great telescope, and the numerous fine portraits in the text, including those of Vice-President Morton and Gen. Schofield.

NEW YORK, *April 6, 1889.*

CONTRIBUTORS.

Among the Contributors to this Volume of the "Annual Cyclopædia" are the following :

Herbert B. Adams, Ph. D.,
Professor in Johns Hopkins University.
CO-OPERATION.

Jerome Allen, Ph. D.,
Editor of the School Journal.
TEACHERS' ASSOCIATIONS.

Marcus Benjamin,
Fellow of the London Chemical Society.
GRAY, ASA,
PHARMACY,
PROCTOR, RICHARD ANTHONY,
and other articles.

J. H. A. Bone,
Editor of the Cleveland (O.) Plaindealer.
OHIO.

Arthur E. Bostwick, Ph. D.
IDENTIFICATION, PERSONAL.

Charles B. Boyle.
MARS, RECENT STUDIES OF.

Samuel M. Brickner.
DISSECTING.

THE ANNUAL CYCLOPÆDIA.

A

ABSENTEE. This term, with its natural derivatives, *absenteeism*, *absenteeship*, etc., has become somewhat conspicuous in contemporary literature, and is generally regarded as of recent origin. But it has a very respectable antiquity, dating back at least to 1537, when the so-called Absentee Parliament was held at Dublin, Ireland (Act of Absentees 28 Henry VIII, chapter 3). Of Henry VIII, Camden says (1605), that he "enriched himself by the spoyles of Abbays . . . and absenties in Ireland." Swift, in the "Argument against Bishops" (1761), says, "The farmer would be screwed up to the utmost penny by the agents and stewards of absentees." In the present century the term is used so commonly that citations are unnecessary, and those that have been given are quoted merely to show that the original meaning has survived the changes of centuries. Absenteeism is not peculiar to Ireland. History abounds with "absentee kings" as well as landlords. "The Norwegians," says the historian Freeman, in his "Norman Conquest," "preferred a foreign and absentee king," and Wallace ("Russia") refers to the "prevailing absenteeism among the landlords."

In general the term carries with it an intimation of reproach. Its simple meaning is—one who habitually or systematically stays away from home; the attainer of reproach is derived from the assumption that any one who derives his income from investments on property in one country, and spends it in another, necessarily impoverishes the land from which his income is derived. The case of Ireland is the most noteworthy of any for the consideration of American readers, inasmuch as absenteeism is more general there than among any other English-speaking people, and to it has been ascribed a great part of the ills to which the Irish peasantry have fallen heir. In any argument in favor of home residence, however, it is necessary to assume that the personal presence, influence, and example of the landlords would be upon the whole beneficial. In

point of fact, Ireland is probably quite as well off with a considerable fraction of her landed gentry beyond the seas as she would be if they remained persistently at home.

In 1672 Sir William Petty estimated that one fourth of the personal property in Ireland belonged to absentees, and Prior in his list published in 1729 reckoned their income at £350,000. In 1769 the estimated income of the absentees was £581,700, and Swift in his time declared that one third of the rental of Ireland was spent in England. Absenteeism, according to the best authorities, continued to increase until the peace of 1816, when it began to diminish. Returns presented to Parliament in 1872 showed that 25·5 per cent. of Irish soil was owned by absentee proprietors, and 26 per cent. by proprietors who, though resident in Ireland, did not live upon their own premises. Prior to these returns a large number of estates had been impoverished by idle and extravagant squireens, and in 1848 and 1849 laws were passed facilitating the sale of encumbered estates, which has continued up to the present time, and has upon the whole reduced the average of absenteeism by subdividing the large estates and combining the small ones so that the present tendency is toward properties of moderate size.

Many historians, however, hold that while Ireland had her own Parliament the local nobility and gentry lived largely on their estates in summer but passed the winter in Dublin, thus spending their incomes among their own tenantry, or at least favoring the local circulation of ready money. With the union of Ireland with Great Britain (1801) London naturally became the political metropolis common to both countries. Moreover, the agrarian disturbances rendered residences so uncomfortable and dangerous that a large number of landed proprietors removed their families to the Continent and rarely visited Ireland.

The absentees have not lacked defenders, who hold that absence has no injurious effect

under modern systems of financial exchange. Thus an Irish landlord living in France receives his rental through bills of exchange, not in bullion, and these bills represent in the end the value of exports from the United Kingdom into France; otherwise, the remittance could not be made. While the absentee therefore consumes French goods for the most part, he aids in creating a demand for a corresponding amount of British goods, so that his tenants are benefited as much as if he had remained at home. It must be confessed that this argument is not altogether satisfactory from a practical and common-sense stand-point, but it served its purpose in its day. The fact is that the legitimate profits made by the tradespeople and others patronized by the absentee accumulate in and about his foreign residence, whereas, if he had remained at home the benefit would have accrued to his own dependents, and the wealth of his native land would have been correspondingly augmented. A just conclusion would seem to be, then, that while absenteeism does entail a certain loss upon the home property, the loss is not fairly represented by the gross income derived from the estates. There are numerous channels through which partial compensations return to the source whence the income is derived.

Granting a good disposition on the part of the land-holder, it is no doubt desirable to reduce absenteeism everywhere to its lowest terms, especially in a country where there is practically no middle class, as is measurably true of Ireland. The disposition to relegate the duty of supervision to an overseer or agent is always objectionable, since too often such agents are not on good terms with the tenants and strive only to increase their own percentages while securing as large returns as possible for their principals.

In free countries enforced residence is of course out of the question, but where the laws are just and properly administered there is little danger that absenteeism will be sufficiently general to affect the welfare of the community. Where it has through past mismanagement become a crying evil, the remedy lies in the slow result of reformatory measures rather than in any arbitrary or revolutionary proceedings.

ABYSSINIA, a monarchy in Eastern Africa. The ruler is King John or Johannis, who is usually spoken of by his title of Negus. The territory directly subject to him is about 130,000 square miles in extent, with a population of not more than 2,000,000 souls. It consists of a high plateau, of the average elevation of 7,000 feet above the sea, which is nearly surrounded by the low-lying provinces of the Soudan. The tributary kingdom of Shoa has an area of 16,000 square miles, and is much more fertile and populous than Abyssinia proper, containing 1,600,000 inhabitants. The King of Shoa has recently occupied Harrar, which extends to the southwest, south, and east of

Abyssinia, with an area of 700,000 square miles, peopled by Gallas, Somalis, and other tribes, which are practically independent.

The Army.—The military forces are commanded by Ras or generals, who are at the same time governors of provinces. The most powerful general is Ras Aloula, ruler of the northern part of the kingdom, who invaded the Soudan and fought a battle with Osman Digma, and afterward attacked the Italians when they attempted to establish posts in the hills back of Massowah. His army numbers about 50,000 infantry and 8,000 horse, and is armed with 18,000 Remington rifles that were captured from the Egyptians, and 500 Wetterli rifles from the Italians at Dogali. The army of the Negus is of the same strength in point of numbers, but has only 10,000 rifles. Another army in the west consists of 20,000 warlike troops with 4,000 rifles, and finds employment in guarding against incursions of the Soudanese. King Menelek, of Shoa, with his subordinate Ras Diurgué, has a force of 80,000 infantry with 50,000 rifles, besides a large body of cavalry, making a total force to resist invasion of over 200,000 men, one third of whom are armed with breach-loaders, and the rest with muskets and spears. The artillery consists of 40 pieces, 30 Krupps having been taken from the Egyptians, besides machine-guns.

The Difficulty with the Italians.—The Abyssinians are Christians, and their archbishop, called the Abuna, is selected and ordained by the Coptic Patriarch at Alexandria. This circumstance and the former possession by the Egyptian Government of the port of Massowah, which gives the Abyssinians their only access to the sea, gave rise to frequent contentions between the Negus and the Egyptian Government. When the Soudan was evacuated, the British Government promised freedom of trade through this port in return for Abyssinian aid in extricating the garrisons of Kassala and other posts in the Soudan. The Italians, who in 1885 established themselves in Massowah and on the adjacent coast, with the acquiescence of Great Britain, were not bound by this guarantee. The Negus suspected an intention on the part of the Italians to conquer and colonize his territory, and resented restrictions that they imposed on trade.

The English Mission.—The almost complete annihilation of a detachment of 540 Italian troops in the vicinity of Dogali in January, 1887, by Ras Aloula, who nearly surrounded them with 20,000 men, led the Italian Government to determine on a regular war. In the hope of averting this, the British Government to which the Negus had appealed in his difficulties with the Italians, endeavored to intercede, sending Mr. Portal and Major Beech as envoys to the Negus in November, 1887. The conditions on which Mr. Portal was authorized to offer peace were the acknowledgment of the Italian occupation of Saati, the cession of a part of the Bogos country, the conclusion of

a treaty of amity and commerce, and an apology for the attack at Dogali. On arriving at Asmara, the headquarters of Ras Aloula, Mr. Portal and his companions were made prisoners, and after many days' detention were sent on in search of the Negus, who was moving from place to place. At last they overtook him on December 5, and were well received, but accomplished nothing in the way of peace negotiations. They left him at Chelicot on December 5, and returned with letters to the Queen of England.

The Italians at Massowah.—By the beginning of 1888 the Italians had erected strong fortifications to guard against attacks either from the land or from the sea. The town of Massowah, which originally belonged to Turkey, and was annexed by Egypt in 1866, is built on a coral island, about two thirds of a mile in length, in the Bay of Arkiko, and has but one road connecting it with the mainland. The Italians have their arsenal at Abd-el-Kader, on a promontory to the north. The army headquarters were at Fort Monkullo, four miles inland. A railroad which ran from Arkiko in the south along the coast to the arsenal, and thence to Monkullo, was extended in February to Dogali and Saati, the terminus being fifteen miles from Massowah. This line of communications was rendered impregnable, and constituted a strong base for operations in the interior. The regular garrison, or special African corps, forms a part of the permanent army of Italy, consisting in 1888 of 238 officers and 4,772 men. It is recruited by voluntary enlistment from all the regiments of the army. A soldier enlists in this service for the term of three years, and receives a special bounty. This body was supplemented by an expeditionary force that was sent from Italy in the autumn of 1887, consisting of 480 officers, 10,500 men, and 1,800 horse. There were besides 2,000 native irregulars under the chief Debeb. The commander-in-chief of the forces was Lieut.-Gen. Asinari di San Marzano. The commandant at Massowah was Maj.-Gen. Saletta. The brigade composed of the African corps, under Maj.-Gen. Gené, and another brigade, under Maj.-Gen. Cagni, were encamped in the beginning of February not far from Saati. A brigade, under Gen. Baldissera was stationed in the north at Singes, where a strong fort was built on the road to Keren, while the fourth brigade, under Maj.-Gen. Lanza, was posted at Arkiko. The fortress and field artillery consisted of 160 pieces.

The Advance of the Negus.—While the Italians were making their position secure around Massowah, the Negus refrained from attacking them, expecting that the large re-enforcements from Italy would attempt to avenge Dogali by marching into his country. There he was well prepared for them. Ras Aloula's army was not far back on the edge of the plateau at Ghinda and Asmara, which places were strongly fortified. In the latter part of February King

John joined Ras Aloula at Asmara, and finding the Italian fortifications completed, concluded that it would be unsafe to attack them. The Italians having made their base secure and perfected their commissary system, sent out flying parties for the purpose of learning the country and of provoking the enemy to advance. Ras Aloula pushed out his outposts, and there were several skirmishes, the Abyssinians invariably retreating. Colonel Vigono, the Italian chief of staff, made an excursion to the Agametta plateau in quest of a suitable position for summer quarters, though there was no intention of advancing beyond Saati before another season. By March the wells were partly dried up and the Abyssinians had drained the country of supplies. The army began to diminish, many parties deserting and going back to their homes. Ras Aloula remained with a part of his forces till June, and then left for his own province.

Mission to Shoa.—There were rumors of a rupture between King Menelek and the Negus, and the Italians, who were aware of the ambitious desire of the King of Shoa to overthrow Johannis and assume the title of Negus, sent Dr. Ragazzi in March to Shoa, by sea, with presents and offers of an alliance. But nothing was accomplished by this mission.

Peace Negotiations.—Overtures for peace were opened by the Negus on March 20, with a message to a native chief who was friendly to the Italians. Gen. San Marzano sent word that if the Negus wished to treat for peace, he must address himself to the commander-in-chief. On the 28th an Abyssinian officer brought a letter from Johannis asking for peace, in which he alluded to the ancient friendship between himself and the King of Italy, and expressed regret for the course taken by Ras Aloula. On March 30 two Abyssinian chiefs were sent by King Johannis, who was then at Saberguma, about ten miles south of Saati, to Gen. San Marzano to continue the negotiations. The Negus marshaled at that point a formidable army, either for the purpose of attacking, or as a military demonstration. On instructions received by telegraph from the Italian Government the Negus was offered peace on condition (1) that he should acknowledge the Italian occupation of Saati; (2) that he should not oppose the occupation of other points where the troops could spend the hot season; (3) that he should guarantee the safety of the tribes that had sought Italian protection. On the 31st the Negus replied that he could not accept the conditions, and on April 2 he retired from Saberguma with his forces, which were estimated at 90,000 men. In April the Italian expeditionary force returned to Italy.

Defeat of Italian Troops.—Debeb, a native chief who for a time served with the Italians as a mercenary, deserted them with his followers in March, and engaged in plundering the region around Massowah. On July 31 the Italian commander-in-chief sent against him 600

Bashi-Bazonks, under five European officers, and Adem Aga, a native ally, who enlisted 200 Assaortins on the way. The latter sent information to Debeb during the march, and the Italian captain, posting the rest of his force around the village of Saganeiti, where Debeb was with 700 men, half of them armed with muskets, entered the place with 100 Bashi-Bazonks, and drove the Abyssinians out of a fort, which he then occupied. The Assaortins went over to the enemy during the fight, and the Italian irregulars fled from the fort in disorder. Those outside were panic-stricken, and the entire force was routed, with a loss of 850 men. The Italian officers, with the few who stood by them, fell fighting, and the rest were killed in flight. Before the occurrence of this reverse, Maj.-Gen. Baldissera had relieved Gen. San Marzano in the command of the Italian forces in Africa. The chieftain Debeb was a relative of the Negus, whose favor he regained with the Italian rifles with which his force of scouts were armed when they deserted with their leader to the Abyssinians. His raids during July in the Habash country, lying between the mountains and the Red Sea, grew so bold that he plundered the neighborhood of Arkiko, four miles from Massowah, before the punitive expedition was undertaken. The principal sufferers were the Assaortins, which tribe was under Italian protection. The Italian commander-in-chief hoped by the expedition to Saganeiti to encourage the revolt of the petty chiefs of the province of Tigré, who had thrown off the authority of the Negus when he withdrew his troops to meet the dervishes. Capt. Cornacchia, commanding the expedition, had orders to surprise Saganeiti by a forced march, but to withdraw if he found that the enemy knew of his approach. He failed to observe his orders as to speed and secrecy, and when he reached Saganeiti, which is seventy-five miles distant from Massowah, he allowed himself to be ambushed in the village, which had the appearance of being deserted when his force first entered.

Diplomatic Difficulties.—The military governor of Massowah on May 30 imposed a tax on real-estate proprietors and traders for streets and lights, and on June 1 a license-tax on dealers in liquors and food. French and Greek merchants refused to pay these taxes. In the summer, the French Government, which has regarded with jealousy Italy's occupation of Massowah, put forward the claim that the capitulations existed there, as in other Eastern countries, and that Italy was debarred from imposing taxes and exercising criminal jurisdiction as regards French citizens and *protégés* without the consent of France. Signor Crispi denied that the capitulations had existed there under Turkish and Egyptian rule, declared that if they had they were extinguished by Italian occupation, and asserted that, even if they still were in force, foreigners would be subject to municipal taxation, as in Bulgaria,

Cyprus, Egypt, and Turkey. In a second note he explained that the judicial system at Massowah was the same as at Tadjurah and Zeilah, declared that the occupation of Massowah fulfilled the conditions laid down in the general act of the Berlin Conference, and characterized the objections of France in the following vigorous words:

It is not from Turkey that complaints and objections reach us, but, as is always the case, from France, who has succeeded in attracting Greece into the orbit of her demands; from France, who would appear to regard the pacific progress of Italy as tending to diminish her own power, as if the African continent did not afford ample scope to the legitimate activity and civilizing ambition of all the powers.

The Greek Government at first supported the protests of France, but was brought to accept the Italian view. The Italian foreign minister characterized the course of the French Government with a severity of language not usual in diplomatic intercourse, because it seemed actuated by a meddlesome desire to interfere, since there were only two French traders in Massowah, and the capitulations had been invoked by the French consul in behalf of Greeks, who were claimed to be French *protégés*. After the exchange of views between the Italian and Greek Cabinets, the merchants paid their taxes, but before that occurred several had been arrested, and some of them banished as rebels. M. Goblet, in August, replied to the Italian note in a circular, insisting that France had always regarded Massowah as Egyptian and Turkish territory. France was the only power having a vice-consul there, and he had received his *exequatur* from the Porte. Italy had for a long time disclaimed the idea of permanent occupation, and had failed to fulfill the requirements of the Berlin Convention of 1885, by not notifying the fact of taking possession to the powers, so that they might have an opportunity to make objections. The French minister denied that the capitulations could be set aside without the consent of the powers interested, and pointed out that, in other cases, as in those of Tunis, Bosnia, and Cyprus, the power taking possession had been able to produce a treaty concluded with the protected or sovereign government. He concluded by saying that if Europe assented to the Italian procedure the French Government would take note that henceforward the capitulations disappear without negotiation and without accord of the powers wherever a European administration is established.

This discussion gave Turkey an opportunity to renew her claim of suzerainty over the western coast of the Red Sea. The Porte dispatched a circular note to the powers, declaring the Italian occupation of Massowah to be a violation of treaties, and denying that the mention of its possessions on the Arabian coast only in the Suez Canal convention implies a renunciation of its sovereignty over the Soudan. Russia, as well as France, joined in the diplomatic protest of the Porte. Germany, Great

Britain, Austria-Hungary, and Spain declared the capitulations inapplicable to Massowah.

Annexation of Zulla.—One of the grounds for French remonstrances against the Italian policy in Africa was that France had some vague claims under old treaties to portions of the coast south of Massowah that Italy in 1888 added to her possessions. Italian irregulars occupied Zulla, which was nominally still subject to Egypt, and in like manner established themselves at Dissé and Adulis. In the beginning of August the Italian flag was unfurled at Zulla, and a protectorate was formally proclaimed over the district. The Italian Government, in a note to the signatories of the general act of the Berlin Conference, notified them of its action, which it declared to be only an official confirmation of a previously existing fact, and a step that was taken in compliance with the demands of the local sheikhs. The Italian flag was raised also at Adulis and Dissé.

ADVENTISTS, SEVENTH-DAY. The statistics of the Seventh-Day Adventist Church, as given in the "Year-Book" for 1888, show that it consists of thirty conferences, with the Australian, British, Central American, General Southern, New Zealand, Pacific Islands, South African, and South American missions. They returned, in all, 227 ministers, 182 licentiates, 889 churches, and 25,841 members. The whole amount of tithes received during the year was \$172,721. The General Conference Association is a body which has been incorporated under the laws of the State of Michigan to act as the business and financial agent of the General Conference. It will guard the financial interests of the General Conference, and is expected to furnish provisions for the care of the property, deeds, bequests, and wills that may accrue to that body, and to keep its accounts. The object of the association is in its constitution declared to be to diffuse moral and religious knowledge and instruction by means of publishing-houses for such purpose, publications therefrom, missionaries, missionary agencies, and other appropriate and available instrumentalities and methods. Being wholly benevolent, charitable, and philanthropic in its character, the payment of dividends on any of its funds is prohibited, and its property may only be used for carrying into effect the legitimate ends and aims of its being. As reported to the General Conference the receipts of the Tract and Missionary Society for the year 1887 were \$10,181, and the expenditures, \$3,118. Besides missionary labor in the United States and other countries, tracts and publications had been sent by the society to South and West Africa, British and Dutch Guiana, Brazil, the West Indies, British Honduras, several places in Russia, some of the islands of the Pacific Ocean, to different points in the Southern States, and to city missions under the control of the General Conference. The society at its annual meeting recommended the circulation of a particular newspaper, the purpose of which is to oppose the "National Reform"

movement for the incorporation of a recognition of the Christian religion into the Constitution of the United States. The International Sabbath-school Association returned an income of \$6,446, and expenditures of \$6,038. Provisions were made at its annual meeting for the preparation of series of lessons for the years 1888-'89 on Old Testament history, "The United States in Prophecy," "The Third Angel's Message," on the leading doctrines of the Bible "for the use of those newly come to the faith," and, for little children, on the life of Christ, with special lessons on "God's Love to Man" for the camp-meeting Sabbath-schools.

The receipts of the Central Publishing Association had been \$412,416. The Pacific Publishing Association returned property and assets to the value of \$246,949.

The accounts of the Education Society were balanced at \$86,664, and its assets were valued at \$58,017. The organization of departments of manual training in the schools of the denomination was approved; and the preparation of a pamphlet was directed to explain the purpose and nature of that branch of instruction.

The Health and Temperance Association had enjoyed a large increase of activity. The Rural Health Retreat Association reported a fund amounting to \$21,372.

General Conference.—The General Conference of Seventh-Day Adventists met in its twenty-sixth annual session at Oakland, Cal., Nov. 18, 1887. Elder George I. Butler presided. The conference in Norway was admitted, constituting the third conference in the Scandinavian field. The conference lately organized in West Virginia was received. The president made an address in which he spoke of the work of the denomination as advancing, notwithstanding increasing opposition. Remarkable success had attended the movements in Holland, and fields were opening, besides the United States, in South Africa, South America, and the West Indies. Immediate acts of prosecution against members for violation of the Sunday laws of some of the States had been restrained, so that none were now embarrassed by them, but the current in favor of making those laws more stringent was increasing, and greater difficulties in that direction were to be anticipated. Delegates from foreign fields reported concerning the condition of their work; from the Scandinavian countries that there were in Denmark, 9, in Norway, 4, and in Sweden, 10 churches, with an aggregate membership of 810 in the three conferences. It had been difficult to furnish from the office of publication books enough to meet the demands of canvassers. The work in this branch was self-sustaining. The mission in England had been in progress for about nine years, and now returned four churches and about 185 members. In Australia there were three churches and 150 observers of the seventh day. The plan of holding mission schools in Central Europe, Scandinavia, and Great Britain for the purpose

of educating canvassers and colporteurs was approved by the conference. The subject of securing a ship for missionary work among the islands of the sea was favorably considered, but postponed on account of the lack of funds available for the purpose, and was referred to a committee, which was authorized to receive gifts during the year and report to the next general conference. A week of prayer was appointed, to be observed from December 17 to December 25, and a programme of subjects for each day's services was arranged. A committee was appointed to which were referred all questions growing out of prosecutions under the Sunday laws of the States against seventh-day observers; and it was authorized to prepare a statement properly defining the position which Sabbath-keepers should occupy in the various contingencies which may arise under the enforcement of those laws. Further resolutions were adopted on this subject, declaring that

Whereas, The teachings of Christ entirely divorce the church and the state; and, *Whereas*, The state has no right to legislate in matters pertaining to religious institutions, and Sunday is only a religious institution; therefore, *Resolved*, That we as a people do oppose by all consistent means the enactment of Sunday laws where they do not exist, and oppose the repeal of exemption clauses in Sunday laws where they do exist; that we recommend that a pamphlet be prepared (1) showing the true relation which should exist between the church and the state; (2) exposing the organized efforts now being made to unite church and state by changing the Constitution of our country; (3) showing the real effect of unmodified Sunday laws in places where they have been in force; and that said pamphlet be placed in the hands of all legislative bodies where efforts are or shall be made to secure the enactment of Sunday laws.

Whereas, To quietly and peaceably do our work six days in the week, as well as to keep the seventh day as the Sabbath of the Lord, is duty toward God, and an inalienable right, and that with which the state can of right have nothing to do; therefore, *Resolved*, That there is no obligation resting upon any observer of the seventh day to obey any law prohibiting labor on the first day of the week, commonly called Sunday. That while asserting this right, and while practicing the principle avowed in this resolution of working the six working-days, the resolution is not to be so construed as either to sanction or approve any arrogance on the part of any, or any action purposely intended to offend or impose upon the religious convictions or practice of any person who observes the first day of the week. *Whereas*, we deem it essential to the proper work of the third angel's message that the true relation existing between the church and the state, and the relation that exists between what men owe to God and what they owe to civil government should be understood; therefore, *Resolved*, That we recommend that this subject be made a part of the regular course of Bible study in all our colleges; and that special attention be given to it by our ministers in the field.

Resolutions were adopted declaring that

Whereas, Our Saviour has laid down the one sole ground on which parties once married can be divorced; and, *Whereas*, The practices of society have become most deplorable in this respect, as seen in the prevalence of unscriptural divorces; therefore, *Resolved*, That we express our deprecation of this great evil, and instruct our ministers not to unite in mar-

riage any parties so divorced; and that we exhort our own people, when about to contract matrimonial alliances, to bear in mind, and give due weight to the injunction of the apostle, "only in the Lord."

The fifth annual session of the European Council was held at Moss, Norway, June 14 to 21, 1887. Action was taken with reference to colportage; to the translation into different languages and publication of books; to the conduct of mission journals; and to the education of missionaries.

AFGHANISTAN, a monarchy in Central Asia, lying between the Punjab and Beluchistan on the south and Russian-Turkestan on the north, with Persia on the west. The ruler is the Ameer of Cabul, Abdurrahman Khan, who has striven with some success to consolidate his authority over the semi-independent tribes that owe him allegiance, but by the imposition of taxes provoked a revolt among the Ghilzais, who are the most numerous and warlike tribe of his immediate subjects.

Internal Disorders.—The Ameer was not able to re-establish his authority over the tribes that rebelled against taxation in 1887. One of his generals, Gholam Hyder Orakzai, led an army consisting of six regiments of infantry, four squadrons of cavalry, and an artillery force of thirteen guns against the rebels in the Ghuzni district during the winter, and succeeded in inflicting some punishment on them and in restoring order for the time being. In January Abdurrahman went to Jelalabad with a force of 12,000 men for the purpose of reducing to submission the Shinwarri, Teerah, and other insurgent tribes of northeastern Afghanistan. His commander-in-chief, Gholam Hyder Khan Charkhi, had already been operating in that country and entered into negotiations with the Shinwarri.

Mistrusting the vigilance or fidelity of the Persian authorities who had once let Ayub Khan, the Afghan pretender, escape from his retreat at Meshed, and allowed him to carry on a correspondence with the rebels, the British Government persuaded the Shah to deliver him over into its custody. He left Meshed in January, and was taken to India, and securely interned at Rawl Pindi.

In the summer Ishak Khan, the Governor of Afghan-Turkistan, showed signs of insubordination. He is a cousin of Abdurrahman, being the son of Azim Khan, who was Ameer of Cabul for a few months in 1867, and was overthrown by Shere Ali. Ishak Khan was Abdurrahman's companion in exile, and has always professed subservience to his cousin, yet he has long been suspected of aspiring to the throne. He has discharged the duties of his post with ability and diligence for eight years, and in his own province he has contributed to the success of Abdurrahman's project of uniting the several parts of Afghanistan into a single realm, and has enabled the Ameer to draw some of his best troops from the Uzbek of Turkistan. The province has been

subdued by Ishak's unassisted efforts, and the Ameer has never ventured to interfere with his administration.

The Russo-Afghan Boundary.—The joint Anglo-Russian Boundary Commission completed the last stage of the boundary delimitation before the end of January, 1888, and dispatched the final protocol with maps of the frontier on February 4. The English commissioners, Maj. Peacocke and Capt. Yate, then returned to England over the Trans-Caspian Railway and through Russia.

The Central Asian Railway.—The Russo-Bokharan Railway, which was completed as far as Chardjui in 1887, was extended through Bokhara to the terminus at Samarcand, and opened with festivities in July, 1888. Gen. Annenkoff, who projected and directed the construction of the road, has been appointed chief director for two years, and has the disposal of 4,500,000 rubles, which is less than half the sum that the Department of the Imperial Control has decided to be requisite to finish the work, but more by 1,500,000 rubles than the general has declared to be sufficient. The total cost of the line has been 48,000,000 rubles. The whole length of the railway from the Caspian to Samarcand is 1,845 versts, or about 900 miles. The section from Kizil Arvat was begun seven and a half years before the completion of the work, but the whole line east of that place was built in three years, and the section from the Oxus to Samarcand, a distance of 846 versts, or 230 miles, was rushed through in six months. The cost of this section is officially stated at 7,198,000 rubles. The journey between St. Petersburg and Samarcand will not take more than ten days, after the railroad is in proper working-order.

Annexation of Pishin to British India.—By virtue of the treaty made by the Ameer Yakub Khan at Gandamak on May 26, 1879, the districts of Pishin and Sibi were assigned to the British Government for temporary occupation and administration. The revenues beyond what was necessary for the expenses of civil administration were to be paid over to the Ameer. After the abdication of Yakub Khan these districts remained in British occupation, whereas the Kunam valley was evacuated by the British troops in 1880, and handed over to the independent control of the Tussi. On the completion of the Sibi Pishin Railway in 1887 the occupied districts were formally incorporated in the Indian Empire, and placed under the administration of the chief commissioner of British Beluchistan.

AGNOSTIC. Although directly derived from the Greek *ἄγνοστος* (unknown, unknowing, unknowable), this word in its Anglicized form is not found in any of the standard dictionaries prior to 1869. Richard Holt Hutton is responsible for the statement that it was suggested by Prof. Thomas Henry Huxley at a social assemblage held shortly before the formation of the subsequently famous Metaphysical Society.

To Huxley in turn it was suggested by St. Paul's reference to the altar raised in honor of "the unknown God." An agnostic is one who holds that everything beyond the material is unknown and probably unknowable. In his view the whole visible and calculable universe is material in greater or less degree, and therefore to some extent knowable, but the unseen world and the Supreme Being are beyond human perceptions and therefore unknowable.

The "Spectator" of Jan. 29, 1870, said of Prof. Huxley: "He is a great and even severe agnostic, who goes about exhorting all men to know how little they know." Again, in 1871, Mr. Hutton writes: "They themselves (the agnostics) vehemently dispute the term (atheism) and usually prefer to describe their state of mind as a sort of know-nothingism or agnosticism or belief in an unknown and unknowable God."

In 1874 St. George Mivart ("Essay on Religion") refers to the agnostics as "Our modern sophists . . . who deny that we have any knowledge save of phenomena." "Nicknames," says the "Spectator" of June 11, 1876, "are given by opponents, but agnostic was the name demanded by Prof. Huxley for those who disclaimed atheism, and believed with him in an 'unknown and unknowable' God, or in other words that the ultimate origin of all things must be some cause unknown and unknowable."

Principal Tulloch in an essay on agnosticism in the "Scotsman" of Nov. 18, 1876, said: "The same agnostic principle which prevailed in our schools of philosophy had extended itself to religion and theology. Beyond what man can know by his senses, or feel by his higher affections, nothing, as was alleged, could be truly known."

Conder, in "The Basis of Faith" (1877), wrote: "But there is nothing *per se* irrational in contending that the evidences of theism are inconclusive, that its doctrines are unintelligible, or that it fails to account for the facts of the universe or is irreconcilable with them. To express this kind of polemic against religious faith, the term agnosticism has been adopted."

Dr. James McCosh in an essay on "Agnosticism as developed in Huxley's 'Hume'" ("Popular Science Monthly," August, 1879), writes: "I am showing that the system is false and thus leads to prejudicial consequences—false to our nature, false to the ends of our being."

In 1880 (June 26), the "Saturday Review" printed the definition so widely quoted by the orthodox press: "In nine cases out of ten, agnosticism is but old atheism writ large."

Sir George Birdwood ("Industrial Arts of India," 1880) said: "The agnostic teaching of the Sankhya school is the common basis of all systems of Indian philosophy."

James Anthony Froude, in his "Life of Carlyle" (1882), writes: "He once said to me that the agnostic doctrines were to appearance like the finest flour, from which you might expect

the most excellent bread; but when you came to feed on it you found it was powdered glass, and you had been eating the deadliest poison."

These are but a few of the examples that abound in contemporary literature. For Prof. Huxley's own views, the reader is referred to his works, especially such essays and chapters as are semi-religious or speculative. While Prof. Huxley is, as has been seen, popularly and no doubt rightly credited with having originated the term agnostic, in its modern acceptation, he is by no means the founder of the school that holds to a belief solely in material things. The Grecian sophists, and probably more anciently still the various Chinese and Oriental schools, taught and teach similar theories. In more recent times Descartes, Kant, David Hume, John Stuart Mill, and others have followed out trains of thought more or less identical, but all suggestive, whether just or not, of atheism. With Huxley the repudiation of atheism was strongly emphasized, but his orthodox opponents have never been willing to admit that he and his contemporaries succeeded in freeing themselves from the implied charge. As popularly phrased by the "Saturday Review," it is held to be "atheism writ large"; and yet, when candidly examined, the agnostic creed can hardly be distinguished from those of the more liberal Christian sects. It is an accepted principle of law that a court may properly decide as to the scope of its own jurisdiction, and a school of religion or philosophy should in like manner, and in good faith be permitted to interpret its own belief. While repudiating the charge of atheism, the agnostics have frankly admitted their inability to define or individualize their conception of a deity. Perhaps it is not unnatural that those sects which accept the teachings of the Old and the New Testament, in this regard, should consider non-acceptance as equivalent to atheism. Some of the more important of the essays bearing upon this subject are as follows: "Agnosticism," sermons delivered in St. Peter's, Cranley Gardens, by the Rev. A. W. Momerie, (Edinburgh and London, 1887); "Agnosticism and Women," "Nineteenth Century," vol. vii, by B. Lathbury; "Agnosticism and Women," a reply, "Nineteenth Century," vol. vii, by J. H. Clapperton; "Confessions of an Agnostic," "North American Review"; "The Assumptions of Agnostics," "Fortnightly Review," vol. xiii, by St. George Mivart; "An Agnostic's Apology," "Fortnightly Review," vol. xix, by Leslie Stephen; "Variety as an Aim in Nature," "Contemporary Review," November, 1871, by the Duke of Argyll.

ALABAMA. State Government.—The following were the State officers during the year: Governor, Thomas Seay, Democrat; Secretary of State, O. C. Langdon; Treasurer, Frederick H. Smith, succeeded by John L. Cobbs; Auditor, Malcolm O. Burke, succeeded by Cyrus D. Hogue; Attorney-General, Thomas N. McClellan; Superintendent of Public Instruction,

Solomon Palmer; Commissioner of Agriculture, Rufus F. Kolb; Railroad Commissioners, Henry R. Shorter, Levi W. Lawler, W. O. Tunstall; Chief-Justice of the Supreme Court, George W. Stone; Associate Justices, David Olopton and H. M. Somerville.

Finances.—The balance in the treasury on Oct. 1, 1887, was \$276,488.82, and on the same date in 1888 it was \$555,587.87. During the year, in accordance with a law passed by the last Legislature, the entire school-fund, hitherto retained in the counties and disbursed there, was paid into the State treasury. Of this fund, there was in the treasury at the latter date \$181,801.21; leaving the actual balance for general purposes, after deducting this and other special funds, \$316,916.89. The bonded debt of the State remains the same as in 1887. An act of the last Legislature providing for refunding the 6-per-cent. bonds amounting to \$954,000 into 34-per-cents. has not yet been complied with by the Governor, as the former bonds are not redeemable till 1890, and he asks an extension of his power till that time. The tax valuation of the State in 1886 was \$173,808,097; in 1887, \$214,925,869. And for the present year about \$223,000,000.

Education.—The report of the State Superintendent of Education for the year ending Sept. 30, 1887, presents the following statistics: Outside of the cities and special school districts, 3,658 schools for white pupils and 1,925 for colored pupils were maintained; the total number of pupils enrolled in the former being 153,304, and in the latter 98,396. The average daily attendance was 93,723 in the white schools, and 63,995 in the colored. During this time the total number of white children within school age was 272,730; of colored children, 212,821. There were 2,418 male teachers in the white schools and 1,237 female; 1,264 colored male teachers and 569 female. The average length of the school year was only 70.5 days, a decrease of over sixteen days from figures of the previous year, due to the omission of returns from the city and special district schools in this report. The total sum available to the State for school purposes during the year was \$515,989.95, and the expenditures amounted to \$527,319.88, necessitating the use of a portion of the unexpended balance of former years. The schools of the State stand in urgent need of stronger financial support. For several years the school fund has been increased but slightly, while the school population has been steadily growing in numbers, being 32,614 greater at the close of the school year in 1887 than in the previous year. The per capita disbursement by the State in 1887, being about seventy cents, is less than in many of the Southern States.

The Convict System.—The contracts under which the convicts sentenced to the State Penitentiary had been previously employed, expired by their terms on the first of January, and, in accordance with the law, proposals were issued

for a new lease, which was awarded to the East Tennessee Coal, Iron, and Railroad Company. The convicts are to be employed in the Pratt coal-mines, near Birmingham, where the company agrees to build prisons and to maintain schools for the benefit of the convicts. Female convicts are exempted from this lease, and also all those who by reason of age, infirmity, or physical defect, were unable to perform hard labor. The class of convicts last described are gathered at the walls of the old Penitentiary at Wetumpka, and are engaged in such employments as are suited to their condition.

"In accepting this proposal," remarks the Governor in his last message to the Legislature, "whereby the continuance of the present lease system in Alabama appears to be fixed for a term of ten years, I do not intend to give the sanction of my judgment to the perpetuation of the lease system. I thought, however, and still think, considering the state of our finances, which does not yet justify an entire disregard of pecuniary considerations, and considering also the characteristics of those who constitute very largely the criminal class, that the lease system could not at present be dispensed with."

Railroads.—The report of the railroad commissioners for this year shows that there are 3,205 miles of railroad, including branches and sidings, in the State. During the year, 530 miles of new railroad were constructed, indicating an unusually rapid development.

Yellow Fever.—Great alarm was felt throughout the State, in the latter part of September, over reports of the existence of yellow fever in several localities. These reports proved unfounded, except in regard to Decatur, where, about September 20, several well-defined cases appeared. The disease soon became epidemic, and all who were able to leave the city, at once fled, leaving scarcely 500 persons remaining out of a population of several thousand. Quarantine regulations were enforced against the city, and the regular course of business was suspended. Although the epidemic was at no time violent, one or more new cases appeared almost daily for about two months, when the frosts of the latter part of November put an end to the scourge. The total number of cases reported up to November 1, was 123, of which 30 terminated fatally. The cases reported in November increase these figures but slightly. Contributions were received from several Northern cities in aid of the sufferers. Sporadic cases among refugees from Decatur occurred in other parts of the State, but there was no epidemic.

Decisions.—A decision of the State Supreme Court was rendered in March, declaring unconstitutional the act of the last General Assembly making appropriations for the establishment and support of a State University for colored people. The act provides that the sums appropriated shall be taken from that part of the common-school fund set apart for the education of

the colored race in Alabama. The opinion holds that this university is not a part of the common-school system of the State within the meaning of the Constitution, and that the act under consideration, in declaring that the sum appropriated shall be taken from that portion of the common-school fund given to the colored race destroys the equality of the apportionment of that fund between the white and colored races required by the Constitution.

Earlier in the year another act of the same General Assembly, requiring locomotive engineers to obtain a license from the State, was passed upon by the United States Supreme Court and upheld. It was urged that the act, when enforced against engineers running into the State from outside points, became in effect a regulation of interstate commerce, and, therefore, unconstitutional, but the court refused to consider it as such.

In October the same court decided that the law prohibiting the employment of color-blind persons by railroads and requiring all railroad employes to have their sight tested by a board of experts was not a regulation of interstate commerce.

Political.—The first State Convention of the Labor party, which assembled at Montgomery on March 22, was the earliest political movement of the year. The delegates voted to present no separate State ticket, but advised that Labor candidates for the Legislature and for Congress be presented in the several districts. A platform was adopted, of which the following is the more important portion:

We favor such legislation as may lead to reduce the hours of labor; to prohibit the competition of convict labor with honest industry; to secure the sanitary inspection of tenements, factories, and mines; to compel corporations to pay their employes in lawful money of the United States at intervals of not longer than two weeks; and to put a stop to the abuse of conspiracy laws.

We also aim at the ultimate and complete ownership and control by the Government of all railroads, telegraph and telephone lines within its jurisdiction. We would have the General Government issue all moneys without the intervention of banks, and postal savings-banks added to the postal system. We also desire to simplify the procedure of our courts and diminish the expenses of legal proceedings, that the poor may be placed on equality with the rich, and the long delays which now result in scandalous miscarriages of justice may be prevented.

And since the ballot is the only means by which in our republic the redress of political and social grievances is to be sought, we especially and emphatically declare for the adoption of what is known as the "Australian system" of voting, in order that the effectual secrecy of the ballot and the relief of candidates for public office from the heavy expenses now imposed upon them may prevent bribery and intimidation, do away with practical discrimination in favor of the rich and unscrupulous, and lessen the pernicious influences of money in politics.

The Prohibitionists met in convention at Decatur on April 18, and made the following nominations: Governor, J. C. Orr; Secretary of State, L. O. Coulson; Attorney-General, Peter Finley; Auditor, M. C. Wade; Treasurer,

N. F. Thompson; Superintendent of Education, M. C. Denson.

A platform was adopted demanding, in addition to prohibition, national aid to education, a residence of twenty-one years by foreigners before voting, better election laws, and the abolition of the internal-revenue system.

On May 9 the Democratic Convention met at Montgomery, and nominated the following candidates: Governor, Thomas Seay; Secretary of State, O. C. Langdon; Treasurer, John L. Cobbs; Auditor, Cyrus D. Hogue; Attorney-General, Thomas N. McClellan; Superintendent of Education, Solomon Palmer.

Brief resolutions were adopted as follow:

That the firmness, ability, and statesmanship displayed by President Cleveland in the administration of his high office entitle him to the confidence and support of his fellow-citizens. That we indorse and approve his administration, and especially his action and efforts to make a reform and reduction of the tariff, and we believe that the interests of the country demand his re-election, and to that end our delegates to the National Convention are hereby instructed to vote for his nomination.

That we are unalterably opposed to the present war tariff. We demand reform of the tariff and a reduction of the surplus in the Treasury by a reduction of tariff taxation.

That we indorse the administration of Gov. Seay, which has been so eminently satisfactory to the whole people of Alabama.

That we favor a liberal appropriation for public schools, in order that the means of acquiring a knowledge of the rudiments of education may be afforded to every child in the State.

That we favor the encouragement of immigration to this State, and to that end we recommend such wise and judicious legislation by the General Assembly as will best accomplish that result.

The Republican State Convention met at Montgomery, May 16, and nominated the following ticket: Governor, W. T. Ewing; Secretary of State, J. J. Woodall; Auditor, R. S. Hefin; Attorney-General, George H. Craig; Treasurer, Sam T. Fowler; Superintendent of Education, J. M. Clark. This ticket was considerably changed before the election, Robert P. Baker being the candidate for Secretary of State, Napoleon B. Mardis for Attorney-General, and Lemuel J. Standifer for Superintendent of Education. The following resolutions were passed:

That while we deprecate all sectional issues and wish for harmony between all the citizens of our great country, we demand as the legal and constitutional right of the people that the exercise of the right of suffrage shall be full and untrammelled, and that the ballot shall be counted and returned as cast in all sections of this great republic, and to help secure this end we favor a national law to regulate the election of members of Congress and Presidential electors, and demand that the election laws of Alabama be so amended as to hinder fraud and not encourage it.

That we condemn President Cleveland's tariff message and the Mills tariff bill as tending toward free trade and to the destruction of American industries and to the degradation of American labor to the servile condition of European labor, and we favor liberal protection to all American industries and labor.

That we condemn Senator Morgan's declaration that the vast mineral wealth of Alabama is a "doubtful blessing," because it tends to increase the laboring-

man's wages, as hostile to labor, which is the great foundation of human progress and wealth.

That we favor national aid for the education of the children of the republic, and therefore indorse the Blair Bill.

That we favor civil-service reform, and condemn President Cleveland's wholesale removal from office for party reasons, while professing to be in favor of civil-service reform.

That we favor the entire abolition of the internal-revenue system.

That we oppose, now as heretofore, the present convict system of Alabama as brutal, and because it brings convict labor into competition with honest free labor.

At the election, August 6, the Democratic ticket received its usual large majority. The Legislature elected is overwhelmingly Democratic, 32 out of 33 Senators and 91 out of 100 members of the House being Democratic. An amendment to the State Constitution, designed to reduce the amount of local and special legislation demanded at each legislative session, failed of adoption, receiving fewer than 50,000 votes out of a total poll of over 180,000. At the November election a Democratic delegation to the national House of Representatives was chosen. The Democratic presidential ticket received 117,310 votes; the Republican, 57,197; the Prohibition, 588.

ALCOTT, AMOS BRONSON, educator, born in Wolcott, Conn., Nov. 29, 1799; died in Boston, Mass., March 4, 1888. The family arms was granted to Thomas Alcocke in 1616, and the first of the name appearing in English history is John Alcocke, who, after receiving the degree of doctor of divinity at Cambridge, became Bishop of Ely, and was preferred Lord-

AMOS BRONSON ALCOTT.

Chancellor of England by Henry VII. He transformed the old nunnery of St. Radigund in Cambridge to a new college called Jesus. Alcocke was "given to learning and piety from childhood, growing from grace to grace, so that in his age were none in England higher for holiness." Thomas and George Alcocke came to New England with Winthrop's company in

1680, and the descendant of the former, Capt. John, who held a commission from his kinsman Gov. Trumbull, lived on his father's estate, "Spindle Hill," where his grandson, Amos Bronson, the son of Joseph Chatfield and Anna Bronson Alcox, was born. "My father was skilful in handicraft, and in these arts I inherited some portion of his skill, and early learned the use of his tools," wrote Mr. Alcott in his diary, when describing his life in the primitive days of New England. In 1814 he entered Silas Hoadley's clock-factory in Plymouth, and at the age of sixteen began to peddle books about the country. In 1818 he sailed to Norfolk, Va., where he hoped to engage in teaching, but, failing in this, he bought silk and trinkets and made a peddling tour in the adjacent counties, where he enjoyed the hospitality of the planters, who, astonished at the intellectual conversation of this literary Autolytus, received him as a guest. He spent the winter of 1822 in peddling among the Quakers of North Carolina, but abandoned this life in 1823, and began to teach. He soon established an infant-school in Boston, which immediately attracted attention from the unique conversational method of his teaching; but this was in advance of the time, and he was denounced by the press and forced to retire. He then removed to Concord, Mass., where he devoted himself to the study of natural theology and reform in civil and social institutions, education, and diet, and frequently appeared on the lecture platform, where his originality made him attractive. In 1830 he married Miss Abby May, a descendant of the Quincy and Sewall families, and removed to Germantown, Pa., but in 1834 he returned to Boston, and reopened his school, which he continued for several years. His system was to direct his pupils to self-analysis and self-education, forcing them to contemplate the spirit as it unveiled within themselves, and to investigate all subjects from an original standpoint. A journal of the school, kept by one of his pupils, Elizabeth P. Peabody, was published under the title of "A Record of Mr. Alcott's School" (Boston, 1834; 3d ed., 1874). The school suggested to his daughter that of "Plumfield," which is described in "Little Men."

At the invitation of James P. Greaves, of London, the friend and fellow-laborer of Pestalozzi in Switzerland, Mr. Alcott went to England in 1843, and Mr. Greaves having died in the mean time, Mr. Alcott was cordially received by his friends, who gave the name Alcott Hall to their school in Ham, near London. On his return he was accompanied by Charles Lane and H. G. Wright, with whom he endeavored to establish the "Fruitlands," in Harvard, Mass., an attempt to form a community upon a philosophical basis, which was soon abandoned. After living for a while in Boston, Mr. Alcott returned to Concord, where his life was that of a peripatetic philosopher. For forty years he was the friend and compan-

ion of Emerson, who described him to Carlyle as "a majestic soul, with whom conversation is possible." He frequently gave "conversations" in cities and villages, on divinity, ethics, dietetics, and other subjects. These gradually became formal, and were continued for nearly fifty years. They have been thus described: "He sits at a table or desk, and after his auditors have assembled begins to talk on some scientific subject mentioned beforehand. He continues this for one hour exactly—his watch lying before him—in a fragmentary, rambling manner, and concludes with some such phrase as 'The spirit of conversation is constrained to-night,' 'Absolute freedom is essential to the freedom of the soul,' 'Thought can not be controlled.' Then he stops, and the next evening begins with another theme, treats it in the same desultory way, and ends with similar utterances."

The opening of the Concord School of Philosophy, in 1878, gave him new intellectual strength, and he was prominent in its proceedings. The last years of his life were spent with his daughter Louisa, in Boston. He was the intimate friend of Channing, Hawthorne, Garrison, Phillips, Emerson, and Thoreau. The latter describes him as "One of the last philosophers—Connecticut gave him to the world; he peddled first her wares, afterward, as he declares, her brains. These he peddles still, bearing for fruit his brain only, like the nut its kernel. His words and attitude always suppose a better state of things than other men are acquainted with, and he will be the last man to be disappointed as the ages revolve. He has no venture in the present. . . . A true friend of man, almost the only friend of human progress, with his hospitable intellect he embraces children, beggars, insane, and scholars, and entertains the thought of all, adding to it commonly some breadth and elegance. Whichever way we turned, it seemed that the heavens and the earth had met together since he enhanced the beauty of the landscape. I do not see how he can ever die; Nature can not spare him."

Besides numerous contributions to periodical literature, including papers entitled "Orphic Sayings" in "The Dial" (Boston, 1839-'42), he wrote "Conversations with Children on the Gospels" (2 vols., Boston, 1836); "Tablets" (1868); "Concord Days" (1872); "Table-Talk" (1877); "Sonnets and Canzonets" (1882); and "The New Connecticut," an autobiographical poem, edited by Franklin B. Sanborn (Boston, 1887).

His daughter, LOUISA MAY, author, born in Germantown, Pa., Nov. 29, 1832; died in Boston, Mass., March 6, 1888, was educated by her father. Her first literary attempt, "An Address to a Robin," was made at the age of eight, and she soon began to write stories. In 1848 she wrote her first book, "Flower-Fables," for Ellen Emerson, but this made no impression on its publication in 1855. In 1851 she

published in "Gleason's Pictorial" a romantic story, for which she received five dollars. Mr. Alcott never achieved worldly success, and, as the family were in straitened circumstances about this time, she engaged in teaching in Boston, where she took a "little trunk filled with the plainest clothes of her own making and twenty dollars that she had earned in

into her work and breaks the natural grace of childhood by introducing the romantic element, and a hint of self-importance and independence that tends to create a restless and rebellious spirit. She devoted herself to the care of her father, and in "death they were not divided." The sale of "Little Women" has reached 250,000; that of all her works together, over 800,000. Her publications are: "Flower-Fables" (Boston, 1855); "The Rose Family" (1864); "Moods" (1865; revised ed., 1881); "Little Women" (1868); "Hospital Sketches" (1869); "An Old-Fashioned Girl" (1869); "Little Men" (1871); "Aunt Jo's Scrap-Bag," a series containing "Cupid and Chow-Chow," "My Girls," "Jimmy's Cruise in the Pinafore," and "An Old-Fashioned Thanksgiving" (1871-'82); "Work, a Story of Experience" (1873); "Eight Cousins" (1874); "Rose in Bloom" (1876); "Silver Pitchers" (1876); "Under the Lilacs" (1878); "Jack and Jill" (1880); "Proverb Stories" (1882); "Spinning-Wheel Stories" (1884); and the first of a new series, "Lulu's Library" (1885).

LOUISA MAY ALCOTT.

writing." At one time she aspired to become an actress, and had perfected her arrangements for a first appearance, but was prevented by her friends. She occasionally appeared in amateur performances, and wrote a farce entitled "Ned Batchelder's Adventures," which was produced at the Howard Athenæum. She also wrote a romantic drama, "The Rival Prima Donna," the manuscript of which she recalled and destroyed on hearing of dissension among the actors regarding the arrangement of the cast. In December, 1862, she entered into Government service as a hospital nurse, and was stationed in the Georgetown Hospital, near Washington, D. C., until prostrated by typhoid fever, from the effects of which she never recovered. In 1865 she visited Europe as a traveling-companion, and soon after her return to Boston published "Little Women," which pictured her home life, and brought her fame and fortune. This was received with such favor that when "Little Men" was issued the publishers received advance orders for 50,000 copies. Miss Alcott addressed herself to children, and no author's name is more endeared to the young than hers. Although there is little in her writing that is not drawn from personal experience, this is so colored by her imagination, and so strong through her sympathy with life, that her books represent the universal world of childhood and youth. But while they are characterized by humor, cheerfulness, good morals, and natural action, their healthfulness may be somewhat questionable on account of the sentimentality that is woven

ANGLICAN CHURCHES. General Statistics.—The "Year-Book" of the Church of England for 1888 shows that the gross amount of money raised voluntarily and expended in 1886 on the building and restoration of churches, the endowment of benefices, the erection of parsonages, and the provision of burial grounds, while it was considerably less than in 1884, exceeded £1,000,000; and of this sum £53,000 were raised in the four Welsh dioceses. The details of this particular branch of church effort as carried out at Bristol and Plymouth are recorded for the first time in the present volume. They show that while the population of Bristol has increased by nearly 55 per cent. the net gain in church accommodation has been 70 per cent., while the whole expenditure upon church extension has been more than £500,000. A similar work has been going on in the three towns of Plymouth, Devonport, and Stonehouse, at a gross expenditure of £131,000. Nearly £500,000 (£445,398) were raised during twelve years for founding the six new sees of Truro, St. Albans, Liverpool, Southwell, and Wakefield; £50,000 in six years to complete the Bishop of Rochester's "ten churches scheme." The "Universities and Public Schools Missions" for the supply of destitute places in the large towns and parochial missions for the laity have increased steadily. Activity in work for the promotion of temperance, for the rescue of the victims of vice, and for reform, has gone on with growing activity. The statistics of ordinations show that during fourteen years 10,020 persons had been admitted to the order of deacons; and of these admissions, the annual average for the former half of the period was 680, and for the latter half, 770. The statistics of confirmations show that while the average number annually for the nine years ending with 1883 was 166,000, the average for the succeeding three years was nearly

204,000. During 1886, 77 new churches were built, and 185 restored, raising the number of new churches, between 1877 and 1886, to 809, and of restored churches to 2,572. Under the Church Buildings Acts 838 new parishes or districts were constituted between 1868 and 1880. The number of permanent mission buildings other than parish and district churches is given as 4,717, with accommodation for 848,272 persons. Confirmations were held during 1887 at 2,361 centers; the whole number of persons confirmed being 218,688. The voluntary contributions toward the maintenance of Church schools between 1884 and 1886 were given as £1,755,958; the contributions between 1873 and 1887 to the "Hospital Sunday" collections as £727,250, the whole number of collections being 38,134. It was claimed that during the twenty-five years, 1860-'84, Churchmen voluntarily contributed £528,653 for the education of ministerial candidates, £85,175,000 for church building and restoration, £7,496,478 for home missions, £10,100,000 for foreign missions, £22,421,542 for educational work, mainly elementary, £3,818,200 for charitable work (distinctively Church of England), and £2,103,864 for clergy charities, making a total of £81,578,237. Contributions to parochial purposes, unsectarian societies, and middle-class schools are not included in the estimate.

Missionary Societies.—The annual meeting of the Church Missionary Society was held May 1. Sir John Kennaway presided. The total receipts of the society for the year had been £221,330, but they had not covered the expenditure, and there remained a debt of £9,000 to be cleared off; and to meet the demands of various funds, the income of the preceding year must be exceeded by £37,000. Forty-three candidates for missionary work, twelve of whom were women, had been received during the year. A resolution was passed approving the action of the Executive Committee in calling for picked men to work among Mohammedans.

The income of the Church Zenana Missionary Society was returned at £23,268. The society includes 900 associations and more than 500 working parties laboring in support of the mission. From the missions—in West Africa, East and Central Africa, Egypt and Arabia, Palestine, Persia and Bagdad, India, Ceylon, Mauritius, China, Japan, New Zealand, North-west America, and the North Pacific—were returned 280 stations, 247 foreign and 265 native ordained missionaries, 62 European and 3,584 native lay and female workers, 44,115 communicants, and 1,859 schools, with 71,814 pupils. The native contributions had amounted to £15,142.

The annual public meeting of the Society for the Propagation of the Gospel in Foreign Parts was held in London, July 10. The meeting was distinguished by the presence of many of the bishops who had come to attend the Lambeth Conference. The Archbishop of Canterbury

presided. The secretary's report showed that the number of ordained missionaries, including nine bishops, on the society's list at that time, was 596, viz., in Asia, 187; in Africa, 189; in Australia and the Pacific, 17; in North America, 183; in the West Indies, 33; and in Europe, 87. Of them, 114 were natives laboring in Asia, and 19 in Africa. There were also in the various missions of the society about 2,000 catechists and lay teachers, mostly natives, and more than 400 students in the society's colleges. Papers were read and remarks made in reference to various aspects of the missionary work in their several fields of labor by the Bishops of Calcutta ("Provincial and Diocesan Organization in India"), Japan, Rangoon, North China, Cape Town, Zululand, Equatorial Africa, Sydney, Fredericton, Missouri, North Dakota, and Guiana, and the Archdeacon of Gibraltar. A paper by the Rev. R. R. Winter, of Delhi, on "Woman's Work in Missions," was read by the secretary.

At a meeting of the Board of Missions of the Province of Canterbury, held July 21, the Archbishop of Canterbury, presiding, said that the board did not seek to work as a new missionary society, or wish to collect money; but that it desired to bring before the Church the necessity of doing a great deal more for missions than was being done at present, and to give proper information to the vast numbers of persons who knew nothing of the missions or of the immensity of the interests centered in them. Several of the American and colonial bishops spoke of the condition and requirements of missionary interests in different parts of the world, and of the importance of giving greater unity to the missionary work. A resolution was adopted assuring the bishops of the various dioceses and missionary jurisdictions abroad of the desire of the board "to aid them in the work of extending the Master's kingdom."

Free and Open Church Association.—It was reported at the annual meeting of this society, in March, that the council had decided to issue an address calling upon the people to defend the Church by uniting in a great effort to get rid of the pew system. The Bishop of Rochester had written that the church which "blandly encouraged her wealthy children to build stately churches for their own enjoyment," leaving the poor to worship in a cold school-room, "forfeited her claim to be the church of the nation."

The Church House.—A plan for the establishment, in London, by a company, of a "Church House," to serve as an informal "headquarters" for the adherents of the Anglican churches, their societies and associations, and as a place of deposit for archives, libraries, and collections, took form in July. The final report of the Executive Committee, which had been appointed by the movers of the project to consider the subject, was presented to the General Committee June 7. A charter of incorporation had been granted for the enterprise on the 28d of February. The receipts in its behalf up to June 30 had

amounted to £45,858, while a balance of £2,681 was remaining at the banker's, besides investments and deposits to the sum of £85,868. The total liabilities incurred and to be incurred in the purchase of the site—which is on the south side of Dean's Yard—amounted to £42,431, for the provision of which the resources of the corporation were amply sufficient. The Archbishop of Canterbury, speaking on the adoption of the report, remarked on the practical value of the scheme, which would provide a house not only useful as a place of business for the Church of England in England, but also as a general meeting-point and rallying-ground for the Anglican communion throughout the world. He was anxious that a good reference library should be formed as soon as possible. A full collection of reports of church work in all parts of the world was needed. Valuable contributions concerning the transactions of the American Church Conventions had already been received from the Bishops of Iowa and Albany. Formal possession was taken of the site on the 21st of July, when the first annual meeting of the corporation was held, and suitable action was taken for accepting the property. The purpose of the scheme was defined to be for facilitating intercommunion among the churches throughout the world. The buildings already on the ground will be occupied for the present, and the erection of others or of better ones will be left to the future, as the means and needs of the enterprise may be developed.

Church of England Temperance Society.—A breakfast was given by the Council and Executive of this association, July 11, to the bishops attending the Lambeth Conference, for purposes of consultations respecting the progress of the society; the movement against the liquor traffic among the native races; and methods by which the organization of the society abroad might be accelerated and made more effective. The Bishop of London presided. A letter was read from the Bishop of New York representing that great benefit had been derived in America from the influence of the society. Resolutions were adopted declaring that the importation of spirituous liquors from England and other countries was having a disastrous effect upon native races in the colonies and dependencies of the British Empire, and recommending the formation of diocesan branches of the society. The resolutions were supported by the Bishops of Sydney, Cork, Pennsylvania, Huron, Colombo, and Zululand, and the Bishop Coadjutor of Antigua. The Bishop of Sydney declared that it was absolutely impossible to exaggerate the utterly disastrous effect which the traffic in spirituous liquors was exercising everywhere.

Powers of the Archbishop.—The case of Read and others *vs.* the Archbishop of Canterbury, involving an appeal of four members of the Church of England resident in the diocese of Lincoln against the refusal of the Archbishop of Canterbury of their request to cite the

Bishop of Lincoln to answer allegations of offense in matters of ritual, was decided by the Judicial Committee of the Privy Council, Aug. 8, after an *ex-parte* hearing. The Bishop of Lincoln was charged by the petitioners with having offended in respect to the celebration of the Communion by using lighted candles on the Communion-table when they were not required for the purpose of giving light; by making at the same service and when pronouncing the benediction, the sign of the cross; by standing while reading the prayer of consecration with his back to the people; and by deviating in no fewer than ten ways from the ceremony prescribed by the Book of Common Prayer. The petitioners prayed the archbishop to cite the inculpated bishop to answer these charges, referring as precedents for the exercise of this power to the case of "Lucy *vs.* the Bishop of St. Davids" (1695), and of the Bishop of Cloghan, which was cited in 1822 by the Archbishop of Armagh. The archbishop replied that, "Considering the fact that in the course of 800 years since the Reformation, there is no other precedent" (than the Bishop of St. David's case), "and considering the political and other exceptional circumstances under which this particular case was decided," he objected to acting without instruction from a court of competent jurisdiction. The decision of the Judicial Committee was to the effect that their lordships were of the opinion that the archbishop had jurisdiction in the case. They were also of the opinion that the abstaining of the archbishop from entertaining the suit was a matter of appeal to Her Majesty. They desired to express no opinion whatever whether the archbishop had or had not a discretion whether he would issue the citation. They would humbly advise Her Majesty to remit the case to the archbishop, to be dealt with according to law. The decision is considered an important one, in that it establishes the right of the archbishop to call bishops to account.

Water in the Communion Service.—A case was heard before the Court of Arches of the Province of Canterbury, February 14, in which the Rev. S. J. Hawkes, of Pontebury, diocese of Hereford, was charged with having administered to communicants water instead of wine at the celebration of the holy communion. The defendant admitted that he had used water on the occasion, as charged, but pleaded that he had intended no offense against the rubrics. He had not been aware beforehand that there was to be a communion service. Finding no wine in the flagon, he in his surprise ordered the clerk to get something. The clerk had brought water, and he had used it without thinking to examine it. Lord Penzance, in giving his decision, while admitting the defendant's excuses, thought that he had erred in judgment; he should have made an explanation or dismissed the congregation, and postponed the service. The court would do no more than admonish the defendant against a

repetition of the offense, and condemn him in the costs. The conduct of the minister in instituting the proceedings was, however, justified. Such a departure from the order of proceedings in the celebration of the holy communion was no light matter. The rubrics of the Prayer-Book were not merely directory, but were in their smallest incidents nothing less than positive commands of law, strictly to be followed and faithfully obeyed. So serious a departure as this case disclosed could not be passed over, in the opinion of the court, without ecclesiastical censure, except at the risk of implying that the breach of them was venial, trivial, or unimportant.

The Convocations.—Both houses of the Convocation of Canterbury met for the dispatch of business, Feb. 29. The archbishop exhibited to their lordships of the upper house letters patent, dated Sept. 16, 1887, conveying the royal assent to the newly amended canons as to the hours of marriage, agreed to by both houses, and gave notice that it was necessary that the two houses should meet together, in order that the new and amended canons might be made, promulgated, and executed. The ceremonial of summoning and receiving the lower house, in full official form, was then performed for the first time, it was said, since 1603. The archbishop read, in Latin and English, the new enactments which brought the law of the Church into harmony with the law of the land, after which the document of assent was signed by the archbishop and bishops, and by the prolocutor, deans, archdeacons, and proctors of the lower house. A resolution of the lower house relating to the election of incumbents by parishioners in cases where the living is vested in the parishioners, was amended and approved. It recommends the insertion of a clause in the Church Patronage Bill providing for the selection of a permanent committee by the parishioners, through which the election shall be conducted. A petition was presented from the Lord's Day Observance Society on the subject of the relaxation of Sunday observance, which appeared to have increased of late years, and to the great increase of Sunday labor; to which the house responded that it deemed it its duty "to appeal to the clergy, to all instructors of the young, and to all who exercise influence over their fellow-men, not to suffer this Church and country to lose the priceless benefits of the rest and sanctity of the Lord's Day. Its reasonable and religious observation is for the moral, physical, and spiritual health of all ranks of the population, and to it our national well-being has been largely due." Sympathy was expressed with the clergy in the difficulties to which they were subjected in the collection of tithes, and the efforts of the house were pledged in favor of measures for remedying them. The president (archbishop) was requested to appoint a committee to consider the question of an increase of the episcopate. A desire was expressed to

have an opportunity of considering the details of certain proposed bills dealing with the ecclesiastical courts before they are settled in the parliamentary committees.

The lower house, recognizing the urgent need of an increase of the clergy, declared by resolution "that it will welcome the accession of duly qualified persons possessed of independent means who will offer themselves for the work of deacons; but that it deprecates any alteration of the law and of the ancient usages of the Church which would involve the relaxation of the solemn obligations of holy orders." The governmental measure for the restriction of the opium-trade with China by giving control of the matter for a period to the Chinese authorities was approved, and the hope was expressed that measures would be taken to prevent the importation of opium into Burmah, and that the Government might see its way clear to "bring about the final extinction of the Bengal monopoly." A further development was suggested of parochial guilds, in which, the house declared, might be discerned a wide possibility of increased spiritual good, both in town and country parishes.

The Convocation assembled again April 24. A report was presented in the upper house from a joint committee of the two houses on the relations of the Convocations of the Northern and Southern Provinces, the consideration of which was deferred. A motion was carried for the appointment of a joint committee to report as to any new organization required to enable the Church to reach the classes of the population now outside of religious organizations. Satisfaction was expressed at the unanimous passage of the House of Commons of the resolution of Mr. McArthur in regard to the traffic in drink with native races. The bishops acted favorably upon an *articulus cleri* of the lower house respecting the exclusion of the clergy from the county councils proposed to be erected under the new Local Government Bill, asking them to take steps to obtain such alteration in the measure as would prevent such exclusion. The lower house having, without instruction from the upper house, acted upon motions suggesting additions to the Church Catechism, dealing with questions of doctrine concerning which the Episcopate claimed the exclusive right of origination, a resolution was passed by the upper house, declaring itself unable to consider the action in question, because it could not regard it "as regular and desirable that synodical validity should be given to formularies professing to set forth the doctrines of the Church for the drawing up and circulation of which the consent of the president had not been applied for and obtained." A report was made in the House of Laymen recommending an increase of the Episcopate, and the adoption, as far as possible, of county boundaries as the bases of the boundaries of dioceses. Concerning the principles which should regulate a system of pensions for disabled or aged

clergy, the house expressed the opinion that "a considerable portion of the fund should be provided by the laity, or by non-beneficiaries; that every clergyman, in order to become eligible for a pension, should be expected to contribute an adequate amount to the pension fund; that the pension should be free from seizure by creditors; and that the age at which, as a general rule, the pensions should commence, should be sixty-five." The house approved the purpose of the Tithe Rent-charge Recovery Bill as a measure for facilitating the collection and recovery of the charge in question.

The Convocation of York met for the dispatch of business April 17. The archbishop, in his opening address, remarking upon differences that had occurred between the two houses at previous sessions, said that the present position of the Convocation had occasioned much anxious thought with him, and that he feared that the two houses would not be able to co-operate in the future. The prolocutor of the lower house (the Dean of York) regarded these remarks as a reflection upon his official course, and offered his resignation, which was accepted. The Rev. Chancellor Espin, D. D., was chosen prolocutor. Resolutions were adopted in the upper house urging the need of the Church for legislation on the ecclesiastical courts, and, without committing itself to the approval of particular recommendations, indicating the report of the Royal Commission, dated July 13, 1883, as the suitable basis of such legislation.

The Lambeth Conference.—The third Lambeth Conference of Bishops of the Anglican Communion—often designated the "Pan-Anglican Conference"—was opened June 30. While the idea of holding a conference of this kind had been frequently mentioned before, the proposition for the first assemblage took serious form in the Canadian Provincial Synod of 1865, which unanimously resolved to urge upon the Archbishop and Convocation of Canterbury that some means should be adopted "by which the members of our Anglican Communion in all quarters of the world should have a share in the deliberations for her welfare, and be permitted to have a representation in one general council of her members gathered from every land." This appeal, it is said, was prompted by the condition of affairs then existing in South Africa, in view of the pronouncement of a sentence of deposition against Bishop Colenso. In compliance with the request, which was seconded by the Convocation of Canterbury, the archbishop issued in February, 1867, an invitation to all the bishops in communion with the Church of England, 144 in number, to meet for purposes of Christian sympathy and mutual counsel on matters affecting the welfare of the Church at home and abroad; explaining, at the same time, that the meeting would not be competent to make declarations or lay down definitions on points of doctrine, but would tend

to promote unity of faith and to bind the bodies represented "in straiter bonds of peace and brotherly charity." Seventy-six bishops responded to this invitation, while the bishops and Archbishop of the Province of York declined to join in the movement. The conference met on the 24th of September, 1867. Its time was largely occupied with discussions of the affairs of the South African churches, while several questions were submitted to committees to be reported upon by them to a meeting of the bishops then remaining in England, in the following December. The second conference was called, again at the suggestion of the Canadian Synod, in July, 1877, and, the bishops of the province of York having concluded to take part in it, was attended by 100 bishops. It met on the 29th of June, and adjourned on the 27th of July, 1878. The subjects discussed regarded "The best mode of maintaining union among the various branches of the Anglican Communion"; "Voluntary boards of arbitration for churches to which such an arrangement may be applicable"; "The relations to each other of missionary bishops and of missionaries in various branches of the Anglican Communion acting in the same country"; "The position of Anglican chaplains and chaplaincies on the Continent of Europe and elsewhere"; "Modern forms of infidelity and the best means of dealing with them"; and "The condition, progress, and needs of the various churches of the Anglican Communion." The reports on these subjects, as adopted by the Conference, were incorporated as a whole in a combined "letter," and put forth to the world in the name of the hundred bishops assembled; which letter was also published in Latin and Greek translations.

The following invitation to the Conference of 1888 was sent out to 209 bishops:

LAMBETH PALACE, Nov. 9, 1887.

RIGHT REVEREND AND DEAR BROTHER:

I am now able to send you definite information with regard to the Conference of Bishops of the Anglican Communion to be held at Lambeth, if God permit, in the summer of next year.

In accordance with the precept of 1878, it has been arranged that the Conference shall assemble on Thursday, July 3, 1888. After four days' session there will be an adjournment, in order that the various committees appointed by the Conference may have opportunity for deliberation. The Conference will reassemble on Monday, July 23, or Tuesday, July 24, and will conclude its session on Friday, July 27.

Information as to the services to be held in connection with the Conference, and other particulars, will be made public as the time draws near.

I have received valuable suggestions from my episcopal brethren in all parts of the world as to the objects upon which it is thought desirable that we should deliberate. These suggestions have been carefully weighed by myself and by the bishops who have been good enough to co-operate with me in making the preliminary arrangements, and the following are the subjects definitely selected for discussion:

1. The Church's Practical Work in Relation to, (a) Intemperance; (b) Purity; (c) Care of emigrants; and, (d) Socialism.
2. Definite Teaching of the Faith to Various Classes, and the Means thereto.

3. The Anglican Communion in Relation to the Eastern Churches, to the Scandinavian and other Reformed Churches, to the Old Catholics, and others.

4. Polygamy of Heathen Converts. Divorce.

5. Authoritative Standards of Doctrine and Worship.

6. Mutual Relations of Dioceses and Branches of the Anglican Communion.

May I venture again to invite your earnest prayer that the Divine Head of the Church may be pleased to prosper with his blessing this our endeavor to promote his glory and the advancement of his kingdom upon the earth.

I remain, your faithful brother in Christ,

EDW. CANTUAR.

The Conference was attended by 145 prelates, representing the Church as follows: The Archbishop of Canterbury and 33 bishops of the province of Canterbury; the Archbishop of York and 11 bishops of the province of York; the Archbishops of Armagh and Dublin and 9 Irish bishops; the Bishop of Minnesota (representing the Presiding Bishop of the United States) and 28 American bishops; the Metropolitan of Fredericton and 8 Canadian bishops; the Metropolitan of Calcutta and 4 Indian bishops; the Metropolitan of Sydney and 3 Australian bishops; 4 bishops from New Zealand; 6 from South Africa; 4 from the Canadian Territories, and the remainder, missionary bishops, including the Bishop of Gibraltar and the Bishop in Jerusalem and the East, who exercise chorepiscopal functions. The Bishop of Gloucester and Bristol acted as Episcopal Secretary; the Dean of Windsor as General Secretary; and the Archdeacon of Maidstone as Assistant Secretary. The Archbishop of Canterbury presided.

The preliminary meetings of the Conference included a service in Canterbury Cathedral on June 30, and a service in Westminster Abbey, with sermon by the Archbishop of Canterbury. The Conference was opened on the 3d of July. The sermon was preached by the Bishop of Minnesota, and bore reference to the importance of unity in the Church, the hindrances to it, and the possibility of a comprehensive union. The business meetings were opened with an address by the Archbishop of Canterbury, in the course of which the various subjects that would be submitted for discussion were referred to. The subject of "Definite Teaching of the Faith to Various Classes, and the Means thereto," was then discussed in private, the opening speeches being by the Bishops of London, Maine, and Carlisle.

The subject of the second day's discussion was "The Anglican Communion in Relation to the Eastern Churches, to the Scandinavian and other Reformed Churches, to the Old Catholics and others," and was introduced by the Archbishop of Dublin. The Bishop of Winchester spoke on the point of intercommunion; the Bishop of Gibraltar gave an account of his interviews with Eastern prelates, and of the state of feeling on the Continent toward the English Church; and the Bishop of Lichfield related the result of his and the Bishop of

Salisbury's visit to the Old Catholics, in 1887. (See "Annual Cyclopaedia" for 1887, article OLD CATHOLICS.)

On the third day the subject of "Authoritative Standards of Doctrine and Worship" was introduced by the Bishop of Sydney, and spoken to by the Bishops of Aberdeen, Western New York, and Australia. The Bishop of Salisbury suggested that very large powers should be conferred on future Lambeth Conferences. The "Mutual Relations of Dioceses and Branches of the Anglican Communion" was discussed by the Bishops of Cape Town, Brechin, and Derry. A petition from the English Church Union, urging resistance to any tampering with the law of marriage, the concerting of measures for securing the celebration of the Holy Communion in all churches on Sundays and holy days, for the reservation of the sacrament, and for the better observance of days of abstinence, was laid on the table.

On the fourth day, "The Church's Practical Work in Relation to (a) Intemperance; (b) Purity; (c) Care of Emigrants; and (d) Socialism," was considered, the several departments of the subject being introduced by (a) the Bishop of London; (b) the Bishops of Durham and Calcutta; (c) the Bishops of Liverpool and Quebec; and (d) the Bishops of Manchester and Mississippi.

The Conference then adjourned till July 23, to give place to the meetings of the committees appointed to consider the subjects referred to them.

The closing service of the Conference was held July 28, in St. Paul's Cathedral, where a sermon was preached by the Archbishop of York.

The results of the deliberations of the Conference, which were published immediately after its adjournment, include an encyclical letter, addressed to "The Faithful in Christ Jesus"; the resolutions formally adopted; and reports of committees accepted but not adopted by the Conference. While the encyclical letter is official and the resolutions are given as formal utterances of the Conference, it was avowed that the reports should be taken to represent its mind only in so far as they were reaffirmed or adopted in the resolutions; but they were printed in the belief that they would offer "fruitful matter for consideration." At the head of the questions which had engaged attention, the letter placed that of the duty of the Church in the promotion of temperance and purity. While the evil effects of intemperance could hardly be exaggerated and total abstinence was highly valued as a means to an end, the language was discountenanced "which condemns the use of wine as wrong in itself independently of its effects on ourselves or on others," and the practice of substituting some other liquid in the celebration of Holy Communion was disapproved. A general action of all Christian people—nothing short of which would avail—was invited to arrest the evil of

impurity, by raising the tone of public opinion and stamping out ignoble and corrupt traditions. The sanctity of marriage was compromised by increasing facilities for divorce, respecting which the Church should insist upon adherence to the precept of Christ. "The polygamous alliances of heathen races are allowed on all hands to be condemned by the law of Christ; but they present many practical problems which have been solved in various ways in the past. . . . While we have refrained from offering advice on minor points, leaving these to be settled by the local authorities of the Church, we have laid down some broad lines on which alone we consider that the missionary may safely act. Our first care has been to maintain and protect the Christian conception of marriage, believing that any immediate and rapid successes which might otherwise have been secured in the mission field would be dearly purchased by any lowering or confusion of this idea." The growing laxity in the observance of Sunday as a day of rest, of worship, and of religious teaching, was deprecated. The importance of the attitude of the Church toward the social problems of the day was urged; and its duties in this category were to be discharged by faithfully inculcating the definite truths of the faith as the basis of all moral teaching: particularly by a more constant supervision of, and a more sustained interest on the part of the clergy in the work done in Sunday-schools; by encouraging the study of Holy Scripture; by cautious and discreet treatment of doubts arising from the misapprehension of the due relations between science and revelation — respecting which, "where minds have been disquieted by scientific discovery or assertion, great care should be taken not to extinguish the elements of faith, but rather to direct the thinker to the realization of the fact that such discoveries elucidate the action of laws which, rightly conceived, tend to the higher appreciation of the glorious work of the Creator, upheld by the word of his power"; and by similar caution in the treatment of questions respecting inspiration. A reference to questions in the mutual relations of dioceses and branches of the communion between which cases of friction may arise, was followed by a definition of the attitude of the Anglican Communion toward the religious bodies now separated from it, which, it was declared:

Would appear to be this: We hold ourselves in readiness to enter into brotherly conference with any of those who may desire intercommunion with us in a more or less perfect form. We lay down conditions on which such intercommunion is, in our opinion, and according to our conviction, possible. For, however we may long to embrace those now alienated from us, so that the ideal of the one flock under the one shepherd may be realized, we must not be unfaithful stewards of the great deposit intrusted to us. We can not desert our position either as to faith or discipline. That concord would, in our judgment, be neither true nor desirable which should be produced by such a surrender. But we gladly and thankfully

recognize the real religious work which is carried on by Christian bodies not of our communion. We can not close our eyes to the visible blessing which has been vouchsafed to their labors for Christ's sake. Let us not be misunderstood on this point. We are not insensible to the strong ties, the rooted convictions, which attach them to their present position. These we respect, as we wish that on our side our own principles and feelings may be respected. Competent observers, indeed, assert that not in England only, but in all parts of the world, there is a real yearning for unity—that men's hearts are moved more than heretofore toward Christian fellowship. May the spirit of love move over the troubled waters of religious difference.

With respect to the Scandinavian Church, the seeking of fuller knowledge and the interchange of friendly intercourse was recommended as preliminary to the promotion of closer relations. Though it was not believed that the time had come for any direct connection with the Old Catholic or other Continental movements toward reformation, the possibility of an ultimate formal alliance with some of them was hoped for. While there were no doctrinal bars to communion with the Eastern Churches such as existed in the Roman Catholic Church, and while all Episcopal intrusions within their jurisdiction and all schemes of proselytizing were to be avoided, it was only right, the letter declares,

That our real claims and position as a historical Church should be set before a people who are very distrustful of novelty, especially in religion, and who appreciate the history of Catholic antiquity. Help should be given toward the education of the clergy, and, in more destitute communities, extended to schools for general instruction.

While it was considered desirable that the standards, as repeatedly defined and as reiterated in the letter, should be set before the foreign churches in their purity and simplicity:

A certain liberty of treatment must be extended to the cases of native and growing churches, on which it would be unreasonable to impose, as conditions of communion, the whole of the thirty-nine articles, colored as they are in language and form by the peculiar circumstances under which they were originally drawn up. On the other hand, it would be impossible for us to share with them in the matter of holy orders as in complete intercommunion, without satisfactory evidence that they hold the same form of doctrine as ourselves. It ought not to be difficult, much less impossible, to formulate articles in accordance with our own standards of doctrine and worship, the acceptance of which should be required of all ordained in such churches.

The resolutions formally adopted by the Conference are in general harmony with the precepts set forth in the encyclical letter. Besides approving, in general terms, the positions assumed in the several reports, they give more formal and detailed expressions concerning some of the questions considered in them. They declare that "the use of unfermented juice of the grape, or any liquid other than true wine in the administration of the cup in Holy Communion, is unwarranted by the example of our Lord, and is an unauthorized departure from the custom of the Catholic Church"; that the Church can not recognize

divorce except in the case of fornication or adultery, or sanction the marriage of a person divorced, contrary to this law, during the life of the other party; that the guilty party, in case of a divorce for fornication or adultery, can in no case during the life of the other party be regarded as a fit recipient of the blessing of the Church on marriage, but that the privileges of the Church should not be refused to innocent parties thus married under civil sanction; that persons living in polygamy should not be admitted to baptism, but that they be accepted as candidates and kept under Christian instruction until such time as they shall be in a position to accept the law of Christ; while the wives of polygamists may be admitted to baptism, but it must be left to the local authorities of the Church to decide under what circumstances they may be baptized. The growing laxity in the observance of the Lord's Day, and especially the increasing practice of making it a day of secular enjoyment, are deprecated, and it is resolved "that the most careful regard should be had to the danger of any encroachment upon the rest which, on this day, is the right of the working-classes as well as of their employers." The opinion of the Conference was expressed that no particular portion of the Church should undertake revision of the Book of Common Prayer without serious consideration of the possible effect of such action on other branches of the Church. The following articles were suggested as supplying a basis on which approach may be made toward "home reunion":

The Holy Scriptures of the Old and New Testaments as "containing all things necessary to salvation," and as being the rule and ultimate standard of faith; the Apostles' Creed as the baptismal symbol, and the Nicene Creed as the sufficient statement of the Christian faith; the two sacraments ordained by Christ himself—baptism and the Supper of the Lord—ministered with unailing use of Christ's words of institution, and of the elements ordained by him; the historic episcopate, locally adapted in the methods of its administration to the varying needs of the nations and peoples called of God into the unity of his Church.

The Conference requested the constituted authorities of the various branches of the communion:

Acting, so far as may be, in concert with one another, to make it known that they hold themselves in readiness to enter into brotherly conference (such as that which has already been proposed by the Church in the United States of America) with the representatives of other Christian communions in the English-speaking races, in order to consider what steps can be taken either toward separate reunion, or toward such relations as may prepare the way for fuller organic unity hereafter.

With expressions of sympathy and fraternal interest toward the Scandinavian Church, the Old Catholic Church of Holland, the Old Catholic Community of Germany, the "Christian Catholic Church" in Switzerland, the Old Catholics in Austria, and the Reformers in Italy, France, Spain, and Portugal, the Conference, "without desiring to interfere with the

rights of bishops of the Catholic Church to interpose in cases of extreme necessity," deprecated any action that does not regard primitive and established principles of jurisdiction and the interests of the whole Anglican Communion. The question of relations with the Moravian Church was remitted to a committee and to the Archbishop of Canterbury. Hope was expressed that the barriers to fuller communion with the Eastern Churches and jurisdictions might, in course of time, be removed by further intercourse and extended enlightenment. The Archbishop of Canterbury was requested to consider whether it is desirable to revise the English version of the Nicene Creed and the *Quicumque Vult* (Athanasian Creed). Lastly it was resolved:

That, as regards newly constituted churches, especially in non-Christian lands, it should be a condition of the recognition of them as in complete intercommunion with us, and especially of their receiving from us episcopal succession, that we should first receive from them satisfactory evidence that they hold substantially the same doctrine as our own, and that their clergy subscribe articles in accordance with the express statements of our own standards of doctrine and worship; but that they should not necessarily be bound to accept in their entirety the thirty-nine Articles of Religion.

Church Congress.—The twenty-eighth Church Congress met at Manchester, October 1. The Bishop of Manchester presided, and the opening sermon was preached by the Archbishop of York. The president, in opening the discussions, spoke of the value of the Congress as an instrument for creating enlightened public opinion; in which, by bringing men of different opinions together, and giving them equal opportunities to present their views, it had advantages over the press. On the subject, "To what Extent should Results of Historical and Scientific Criticisms, especially of the Old Testament, be recognized in Sermons and Teachings," the Rev. J. M. Wilson declared that the clergy must tell the truth, and the whole truth; the Dean of Peterborough sought a definition of the results of criticism; and the president considered the introduction of difficult questions of criticism into the ordinary teachings of the pulpit very undesirable. In the discussion of the question, "How to supply the Defects of the Parochial System by Means of Evangelizing Work," the Rev. W. Carlisle, founder of the Church Army, described the working methods of that organization. Other subjects discussed, with the principal speakers upon them, were: "The Church in Wales (Mr. J. Dilwyn Llewellyn, on "Tithes," the Dean of St. Asaph, on "The Work of the Church"); "The Duty of the Church to Seamen" (on which persons particularly interested in mission work among seamen gave the results of their experience and observations): "Positivism; its Truths and Fallacies" (the Rev. W. Cunningham, the Rev. C. L. Engstrom, and Mr. A. J. Balfour); "The Needs of Human Nature, and their Supply in Chris-

tianity" (the Archbishop of York and Mr. A. Balfour); "Gambling and Betting" (the Rev. Nigel Madan, Prebendary Grier, the Dean of Rochester, and the Rev. Charles Goldney); "The Foreign Missions of the Church of England and the Protestant Episcopal Church of the United States of America" (Rev. F. H. Cox, on "Missions to English-Speaking People," Rev. Dr. Coddington on "Missions to Savages," the Rev. R. Bruce on "Missions to Colonial Lands," and a number of the colonial bishops); "Atheism" (Mr. R. H. Hutton); "Agnosticism" (the Rev. H. Wace, D.D., and "Pessimism" (the Rev. A. W. Momerie); "Temperance; the Demoralization of Uncivilized Races by the Drink-Traffic" (Dr. J. Grant Mills, the Hon. T. W. Pelham, Sir Charles Warren); "Disposal of the Dead" (F. Seymour Harlen, the Rev. H. R. Haweis, Mr. A. Singleton, and the Bishop of Nottingham); "The Sunday-school System in its Relation to the Church" (Canon Elwyn, Canon Trotter, the Rev. J. W. Gedge, and Mr. J. Palmer); "Social Purity" (the Bishop of Newcastle, Mr. G. S. S. Vidal, and G. B. Morgan, D.D.); "Hindrances to Church Work and Progress" (the Bishops of Carlisle and Wakefield and Archbishop Farrar); "Adaptation of the Prayer-Book to Modern Needs" (Canon Meyrick, Archdeacon Norris, Dr. Lumby, of Cambridge, and the Bishops of Sydney, Jamaica, and Grahamstown); "Maintenance of Voluntary Schools; Should the Education in them be Free and Religious?" (Prebendary Roe, the Rev. Dr. Cox, Canon Gregory, and Mr. J. Talbot); "The Bearing of Democracy on Church Life and Work" (Rev. O. W. Stubbs, Rev. Llewellyn Davis, Mr. T. Hughes, Q. C., and Archdeacon Watkins); "Lay Representation in Church Councils and Statutory Parochial Councils" (Lord Egerton, of Patton, Canon Fremantle, and Mr. R. D. Uslin); "Free and Open Churches, Reserved Seats, and their Influence on Attendance" (Prebendary Hannah, the Earl of Carnarvon, Earl Nelson, and the Rev. H. D. Burton); "The Various Phases of Christian Service—Worship, Almsgiving, Work, and Home Life" (Canon Furse, the Bishop of Wakefield, Canons Hoare and Jelf, and the Bishops of Glasgow and Galway, and of Mississippi); "Church Finance" (Rev. W. A. Whitworth, Mr. Stanley Leighton, M. P., and Mr. H. C. Richmond); "Eschatology" (Canon Luckock, Archdeacon Farrar, Rev. O. H. Waller, and Rev. Sir George W. Cox); "Increase of the Episcopate;" "The Desirableness of Reviving the Common Religious Life of Men" (the Dean of Lincoln); and "Lay Help." At "Workingmen's Meetings," held in the evenings during the session, the subjects were presented, in popular addresses, of "The Needs of Human Nature, and their Supply in Christianity" (the Archbishop of York and Mr. A. J. Balfour); "Hindrances to Church Work and Progress" (the Bishops of Carlisle and Wakefield and Archdeacon Far-

rar); "Competition, Co-operation, and Over-Population" (the Bishop of Bedford, Hon. and Rev. A. T. Lyttleton, Archdeacon Farrar, and Prof. Symes); and "the Several Aspects of the Question of Sunday Observance," including the questions of the closing of public houses, the opening of libraries and museums, and Sunday recreation and traveling (Sir W. Houldsworth, M. P., Canon McCormick, and the Bishop of Newcastle).

The Irish Synod.—The General Synod of the Episcopal Church in Ireland met in Dublin in April. The report of the representative body said that the total assets of the Church at the close of 1887 amounted to £7,313,838. The total contributions received during the year footed up to £136,963. The total expenditure for the year had been £488,848. About £12,000 had been received by the treasurers of the "Victoria Jubilee Fund" for the education of the sons and daughters of the clergy. About £3,300 had been received for the purchase of the palace at Armagh, as a residence for the primate.

ANTI-POVERTY SOCIETY, an organization that grew out of the candidacy of Henry George for Mayor of New York city in November, 1886. The number of votes polled for Mr. George on that occasion was a surprise to politicians, and the result was accepted by the members of the United Labor party, whose candidate Mr. George was, as an indication that they should push forward their peculiar doctrines by other means and in other fields. On the 26th of March, 1887, a few men assembled in the city of New York and organized the Anti-Poverty Society, with the following brief declaration: "Believing that the time has come for an active warfare against the conditions that, in spite of the advance in the powers of production, condemn so many to degrading poverty, and foster vice, crime, and greed, the undersigned associate themselves together in an organization to be known as the Anti-Poverty Society. The object of the society is to spread, by such peaceable and lawful means as may be found most desirable and efficient, a knowledge of the truth that God has made ample provision for the needs of all men during their residence upon earth, and that poverty is the result of the human laws that allow individuals to claim as private property that which the Creator has provided for the use of all." The presidency was accepted by Dr. Edward McGlynn, who had become prominent by his connection with the candidacy of Mr. George. A high authority from within the society declares that its indications are "to do God's work. We band ourselves together to do the work of God; to rouse the essentially religious sentiment in men and women, which looks to the helping of suffering. We want to do what churches and creeds can not do—abolish poverty altogether; to secure to each son of God, as he comes into the world, a full share of God's natural bounties,

an equal right in all the advantages and fruits of civilization and progress, a fair chance to develop all his powers." Still another authority defines the scope of the organization as follows: "The poverty that we would abolish arises from the inability to get work, or from the low wages that are paid for work. The inability to get work arises from the lamentable fact that, in most countries—in most civilized countries especially, and in those countries that have attained to the highest civilization and have the densest population, which is an immense factor in high civilization—the general bounties of Nature are appropriated as private property by a few, by a class, and the masses are literally deprived of their divine inheritance; and so, instead of having the equal right to get at the general bounties of Nature, and thus fulfill the duty as well as exercise the right of supporting themselves and their families—the same equal chances that every other man in the world may have—they have to go oring and begging of the few, who are the unjust monopolists of the generous bounties of God, for the boon to labor. They have to crave as a blessing the chance to get work; and where there is an unseemly competition—a scramble like that of brute beasts at the trough—it rests with the monopolists to give the work to the one that will content himself with the least and the poorest fare of all—to the one that will consent to live and reproduce his species with the least proportion of the products of his labor." It has been said that the society leans somewhat to the side of the Anarchists, and this might seem to have some foundation from the recent remarks of Dr. McGlynn, who said: "Killing for political purposes is to be considered as something totally different from the crime of murder. If I should happen to read in to-morrow's papers that the Czar had been killed, I wouldn't put any crape on my hat. Without discussing whether, in moral casuistry, it is lawful to kill the Czar, still I must acknowledge the grand and noble character of the men who think it their duty to do their best to kill him. These heroic men feel that they are doing the noblest and holiest thing they could do for their country in trying to kill the Czar." It was expected that the society would be in such shape as to make its influence felt in the November canvass of 1887 in the State of New York, when the Secretary of State and other State officers were to be elected. Mr. George was nominated for Secretary of State, but he polled scarcely any more votes in the whole State than he had polled for Mayor of New York in 1886. Whatever political influence and strength remained to the United Labor party and the Anti-Poverty Society was apparently thrown for their candidate for Mayor of New York in 1888, who received fewer than 10,000 votes, against 68,000 for George as Mayor in 1886, and 70,000 for George as Secretary of State in 1887.

ARCHÆOLOGY. (American.) Glacial Man in America.—The evidences of the existence of man in America in the Glacial epoch have been summed up by Prof. F. W. Putnam, in the Boston Society of Natural History, and Dr. C. C. Abbott, in the American Association for the Advancement of Science. They include the palæolithic implements which Dr. Abbott has found from time to time since 1876 in the gravels of the Delaware valley, near Trenton, N. J., with parts of two skulls. The formation in which these relics occur is declared glacial by Prof. Cook, State Geologist; it is referred by Mr. W. J. McGee, of the United States Geological Survey, to the southernmost extension of the overwash gravels from the terminal moraine formed during the latter epoch of cold of the Quaternary; and is pronounced by the Rev. G. Frederic Wright, who has examined the terminal moraine of the great glacier from New Jersey westward, across Ohio, to be the direct result of the melting of the glaciers as they retired northward. Dr. Metz, of Madisonville, Ohio, found a chipped implement in the gravel at that place, eight feet below the surface, in 1885, and another at about thirty feet below the surface, in a similar deposit on the Little Miami river, opposite Loveland, in 1887, both in a formation unquestionably glacial. Miss Franc E. Babbitt reported to the American Association, in 1888, concerning the finding of implements and fragments of chipped quartz at Little Falls, Minn., where they occurred in a well-defined thin layer in the modified drift forming the glacial flood-plain of the Mississippi river. Specimens of all these findings were compared by Prof. Putnam with specimens from Abbeville and St. Acheul, France, and with an English specimen from the collection of Mr. John Evans, and were found to bear similar marks of human workmanship, so evident and so uniform in their character as to leave the supposition of their having been results of accident out of the question. They were, however, made from different materials: those from Trenton being, with four exceptions, of argillite; the two from Ohio, one of black chert and the other from a hard, dark pebble, not yet identified; and those from Little Falls, of quartz. Each of these materials was the one suitable for the purpose most easily obtained at the place where it was in use. These implements and the European specimens together show, Prof. Putnam remarks in his review, "that man in this early period of his existence had learned to fashion the best available material, be it flint, argillite, quartz, chert, or other rocks, into implements and weapons suitable to his requirements"; and "that his requirements were about the same on both sides of the Atlantic, when he was living under conditions of climate and environment which must have been very nearly alike on both continents, and when such animals as the mammoth and the mastodon, with others now extinct, were his companions." Evidences of later oc-

cupancy, perhaps by the descendants of palæolithic man, have been found by Mr. Hilborn T. Cresson, in traces of pile-structures in the alluvial deposits at Naaman's Creek, in Delaware. At two of the structures, or "stations," only argillite implements were found, many as rude as some of the palæolithic types, with a large number of long, slender spear-points of that material. In a third station, these forms are mixed with implements of quartz, jasper, and other silicious material, with traces of rude pottery. All these discoveries, according to Prof. Putnam, show that man had occupied a portion of North America, from the Mississippi river to the Atlantic Ocean, at a time when the northern part of the United States was covered with ice, and that at that early period he must have been contemporaneous with the mastodon and mammoth. "When we compare the facts now known from the eastern side of the continent," Prof. Putnam continues, "with those of the western side, they seem to force us to accept a far longer occupation by man of the western coast than of the eastern; for not only on the western side of the continent have his remains been found in zoological beds unquestionably earlier than the gravels of the Mississippi, Ohio, and Delaware valleys, but he had at that time reached a degree of development equal to that of the inhabitants of California at the time of European contact, so far as the character of the stone mortars, chipped and polished stone implements, and shell-beads found in the auriferous gravels can tell the story."

The Construction of a Mound.—A careful examination has been made by Mr. Gerard Fowke of one of the mounds in Pike County, Ohio, in order to ascertain the exact method of its construction. The presence of holes showing traces in the shape of the dark mold resulting from the decay of wood of its having contained posts, and arranged in a regular order, indicated that the mound was built upon the site of a house. A trench had been dug outside of the house, possibly for drainage. Near the middle of the house, which measured about forty feet from side to side, there had been a large fire, from which the ashes had been removed to an ash-bed, which was elliptical, and measured thirteen feet from east to west and five feet from north to south. Near the center of it was a hole a foot deep and ten inches across, filled with clean white ashes, in which was a little charcoal packed very hard. At one end of the ash-bed, and continuous with it, though not apparently a part of it, was a mass of burned animal bones, in equal pieces, ashes, and charcoal. After the fire had burned down, a grave had been dug at the middle of the house, ten feet long from east to west, a little more than six feet broad, and fourteen inches deep, having straight sides slanting inward, with rounded corners. Ashes had been thinly sprinkled on the bottom and a single thickness of bark laid

upon them, while the sides had been lined with wood or bark from two to four inches thick. Two bodies had been placed side by side in the grave, both extended at full length on their backs with their heads directly west. The space within the grave on one side of the skeletons had been covered with ashes that had been removed from the fire, the thickness of the deposit increasing from a mere streak at the feet to six inches at the head, and extending across the grave nearly in contact with the companion head. The earth removed from the grave was thrown around on every side so as to leave the bodies in a hole nearly two feet deep. No trace appears of any protecting material having been laid over the bodies. They were covered with a black, sandy earth, which had been packed so firmly that it required a pick to loosen it, reached beyond the grave on every side, and was about five and a half feet high. No remains were found in the mound above the grave of the posts which had probably once stood there. The author assumes that the great fire near the middle of the house had been made from the timbers composing it; that the upper timbers had been torn down, and the posts cut off at the surface. For the purpose of covering the grave, sand was brought from a ridge a short distance away. There was no stratification. Earth had been piled up first around the black mass, forming the grave-mound, and then different parties had deposited their loads at convenient places, until the mound assumed its final conical arrangement. The lenticular masses through almost the whole mound showed that the earth had been carried in skins or small baskets. The completed mound was thirteen feet high and about one hundred feet in diameter. Three other skeletons were found within it, two on the original surface of the ground, and one two feet and a half above it. The bones were covered with a dull-red substance, showing a waxy texture under the knife-blade, from which it is supposed that the flesh was removed before burial. No relics were found with any of the skeletons.

The Great Serpent Mound.—With the aid of a committee of ladies of Boston, who secured subscriptions for the purpose of nearly \$6,000, Prof. Putnam, of the Peabody Museum of Archæology, purchased for that institution, in June, 1887, sixty acres of ground, including the "Great Serpent Mound," in Adams County, Ohio, and it was converted into an inclosed park. The mound was restored, so far as was practicable, by replacing the earth and other material that had been plowed or washed or carried away. Trees foreign to the spot are to be removed, and replaced with those that are indigenous, so as to make the park an *arboretum* of native trees. As described by Prof. Putnam, in the American Association of 1888, the length of the serpent from tip to tip is about 1,000 feet, and the length, including convolutions, 1,415 feet. The builders appear to

have leveled a ledge of rock before constructing the embankment. Frequent fires seem to have burned during the construction; and in one place so many people had been gathered that the clay was beaten like a floor. The spot has since become covered by a foot of soil. In the center of the elliptical mound that formed the reptile's head was once a pile of stones that had been brought up from the creek; they had been blackened by long-continued fires. No sign was observed that the serpentine embankment was ever used for burial purposes, but an oval mound was found near by in which nine skeletons were discovered—one of them so near the surface that a plow had broken down the stones that formed the coffin and carried away a part of the pelvis. Seven feet below the surface, and lying transversely under the first skeleton, was another resting on a stone floor, over which huge stones had been so piled that the bones were crushed almost to dust. Underneath the stone floor was a stratum several feet thick of black ashes, evidently of burned corn, in which lay a skeleton over six feet in length and of massive proportions.

Origin of the Ohio Mounds.—The evidence obtained through the explorations of the United States Bureau of Ethnology are regarded by Dr. Cyrus Thomas as indicating that the typical ancient works in Ohio—the circles and squares, and other works of that type, together with the mounds pertaining to them, or appearing to be built by the same people—were constructed by the ancestors of the Cherokees. Another class of structures—walls, inclosures, and defensive works in the northern part of the State, and also in eastern Michigan—are attributed to some branch of the Iroquois or Huron-Iroquois stock; the box-shaped stone graves, to the Delawares and Shawnees. Certain stone mounds and mounds containing stone vaults or graves of a peculiar type, indicating "a savage life, and fierce warfare with beasts of prey," are difficult to account for, and are probably the work of a tribe that has become extinct. The effigy-mounds, of which only a few are known in Ohio, but which are compared with similar works in Wisconsin and with the bird-effigies of Georgia, also "present a problem difficult to solve." Fortifications of the type of which Fort Ancient is an example are attributed to the Cherokees; while the work named presents some indications of the influence of the white man. "Omitting the last from the list," says Dr. Thomas, "there remains clear and satisfactory evidence that the ancient works of the State are due to at least six different tribes."

The Rev. S. D. Peet finds in some peculiar features of the earth-works of the Scioto valley, evidences of the existence of a clan-system among the builders. Among these features is the formation in circles and squares of areas varying from twenty-seven to fifty acres. Such works are generally regarded as village-sites, and are accompanied by fortifications and signal-

mounds on the neighboring hills, with covered or walled ways to the river-bank. In some cases there are graded roads through the terraces to the inclosures, as at Newark, Piketon, and Marietta. The villages are situated at intervals, showing that the people dwelt in different centers, and there are very few works between these centers.

Against the supposition that the mound-builders of these villages were the Cherokees, Dr. Peet argues that these works are entirely different from those found in Tennessee, southern Kentucky, and northern Georgia, the habitat of the Cherokees in historic times; and the relics found in the Cherokee country differ from those in the Ohio mounds. The works in the Cherokee country are large rectangular inclosures without circles, while many of the pipes called duck-pipes are found there. There are very few pipes with curved stems, and none of the variety of sculptured animal figures seen on the Ohio pipes; and no effigies of any kind, which are common in Ohio, and more common in Wisconsin, are to be seen in Tennessee.

Preservation of Ancient Monuments.—The committee of the American Association for the Advancement of Science for the preservation of archæological remains on public lands reported to the Buffalo meeting of the Association that it would be well if the following remains of early America could be preserved: Chaco Cañon, from the forks of Escavoda Cañon, for a distance of eight miles up, also one mile back from the brink of the cañon walls on each side; Cañon de Chelly, Cañon del Muerto, Walnut Cañon, the ruin on Fossil creek on the east branch of the Rio Verde and about fifteen miles south of Camp Verde military reservation; the ruin in Mancos Cañon, the round towers situated on the flat valleys of the lower Mancos; the cavate lodges in the cinder-cone about eight miles east of Flagstaff, Arizona Territory. Besides these groups of ruins and dwellings, there are isolated remains in the territories of New Mexico, Arizona, and Utah, numbering over forty, which demand preservation. The Pueblos, which are not in treaty reservations or grants, and the old Mandan and Arikaree village on the Fort Berthold Indian reservation, Dakota Territory, to be preserved when they shall cease to be inhabited by Indians.

The committee has caused a bill to be introduced in Congress providing for a reservation in New Mexico for the purpose of archæological study.

Peruvian.—A Peruvian object, of a unique character and hitherto undescribed, in the Ethnographical Museum of the Trocadero, in Paris, has been brought to notice by Dr. Verneau in "La Nature." It is a hollowed cylinder, of a substance resembling bronze, bearing various ornaments upon its circumference and its upper rim, and measuring sixty millimetres in length and twenty-five millimetres in interior

diameter. It is marked on the outside by two parallel series of double spirals running in the general direction of its length in such a manner as to form four figures resembling the letter S. Twelve rings, solid with the vessel itself, are evenly disposed in rows of four. Those of the first row are exactly above those of the third, while those of the second row occupy an intermediate position. Movable rings, having spherical swellings in the lower part, are hung upon the fixed rings of the upper row in such a way that they strike the

the larger number of the owners of scheduled monuments refused. Those who refused generally did so, however, on the ground that they wished to remain responsible for their own monuments; and very little damage to prehistoric works is going on at present. Public opinion has done more for their preservation than any act of Parliament could do.

Old Roman Wall of London.—A part of the old Roman wall of London has been discovered under the site that has been obtained for the new North Post-Office. The upper part of the wall only was broken down, while the rest is in almost perfect condition, with its masonry sharp and true. One hundred feet of the structure have been cleared and exposed to view. It is constructed with facing-courses of stone—Reigate or "rag"—with red tile, and grouted core. A fragment of a similar structure of genuine Roman work also exists, or did exist, in the cellars on Tower Hill.

Old Roman Baths at Bath.—Traces of the old Roman baths at Bath were first noticed in 1755. Further discoveries of remains were made in 1871. The properties covering the ruins were obtained by the corporation of Bath, and some of the works were opened to public view in 1888. One of the most important of them is 81 feet long and 38 feet wide, and is situated in the center of a hall 110 feet long and 68 feet 6 inches wide, which was formerly roofed with a vault supported by pilasters and arches, and is divided into three aisles, the middle one of which covered the bath. The pedestals and lower parts of some of the pilasters are still standing, and the steps going down into the bath are well preserved. Behind the pilasters, in the side-aisles, which were decorated with sculpture, was a promenade gallery. The floor of this hall was twenty feet below the level of the neighboring modern street. Another spacious apartment had two sudatories, or sweating-rooms, with a fireplace between them and flues to heat them. The circular bath, which is shown in the illustration, has been discovered recently. It appears to have been once lined with lead. These structures were an object of special attention to the British Association, which met in Bath, in September, 1888, and the members of that body devoted an afternoon to visiting and inspecting them. The members assembled around the great oval bath and in it, while the mayor of the city gave an account of the work of opening up the ruins, their character, and the degree of Roman civilization of which they gave evidence. After the Romans left Britain, the baths seem to have been allowed to fall into ruins, for a teal's egg had been found in them, and the common bracken had sprung up. New baths have been built upon the foundations of some of these structures.

Celtic Earthworks in Hampshire.—As many as forty Celtic earthworks are described by Mr. T. W. Shore as remaining in Hampshire, England, in a state of preservation more or less

TINTINNABULUM FOUND IN PERU.

vessel when it is shaken. On the flat rim at the top of the vessel are two groups of two human figures each, facing each other, and representing the same scene. In each of them a repulsive-looking man stands in the attitude of being about to strike with his hatchet a second personage, whom he is holding down. The features and appearance of the four figures and the hatchets bear a distinctly Peruvian stamp. The relic is supposed to be a *tintinnabulum*, or little bell, like those borne on the ends of staffs by Buddhist mendicants in the East, with which they seek to attract the attention of persons from whom they ask alms.

England.—The British Act for the Preservation of Ancient Monuments has been in force for five years; but, according to Lieut.-Gen. Pitt-Rivers, who is intrusted with its administration, only one owner has voluntarily offered any monument to be put under it. All had to be sought out and asked to accept the act, and

complete. They are of various kinds and shapes, and where they inclose areas and form the so-called camps they are of very different dimensions. Most of them are hill-fortresses, but there are also marsh and peninsular fortresses, and one example exists of a small former insular refuge. The present surroundings of these earthworks are of service in assisting to determine their original uses, for, although the woodland features may have changed, the geological conditions are the same as in Celtic times. The camps could hardly have been permanently inhabited sites, for few traces of dwellings or articles of domestic use have been found within them, and from these and other circumstances they appear to have been strongholds for defense in case of attack. If this is allowed, then these areas must have had a distinct relationship to the number of people required for their defense and to the population and their capital or the number of cattle they were intended to shelter. With these data we may draw approximately accurate inferences respecting the location and density of the Celtic population at the time of their construction.

Roman.—In the course of the excavations of the German Institute in the Forum, adjoining the temple of Julius, foundations solidly and well built in travertine have been discovered, which Prof. Richter has identified with the Arch of Augustus. The arch appears to have been one of three piers, like the arches of Severus and Constantine, the middle passage being fourteen feet wide.

Remains of an Archaic Civilization.—Excavations have been made at the site of the ancient Sybaris for the sake of recovering the ruins of the Grecian city that was destroyed five centuries before Christ. Ruins attributable to such a city have not yet been found, but a necropolis has been discovered in the neighborhood which indicates that there existed there previous to the Greek period a more ancient city, the remains of which bear evidence of an archaic civilization precisely corresponding with that, specimens of which have been found at Vetulonia, Civita Castellana, Corneto, and various points in other parts of the peninsula, and in some details with the finds in the lacustrine deposits of the northern provinces. Among the most striking specimens of ancient archaic art, are the cinerary urns of the hut

type, such as have been found on the Alban mountains under two strata of volcanic deposits, and which, with the well-tombs, are characteristic features at Corneto (or Tarquinia). The urns are vessels of the rudest forms of pottery, hand-made and half-baked; and with them in one of the well tombs at Corneto were found bronze helmets of most skillful fabric and swords of bronze or iron; and in some of the tombs copies of the helmets in clay, made for covers to the round urns, a use to which the original helmets seem to have been put

ROMAN BATH, AT BATH, ENGLAND.

after the death of their owner. In the same necropolis with these are found the "corridor" tombs and "chambers," the latest and best known form of the Etruscan tomb, the paintings on some of which at Corneto form a series coming down to Roman times. Conflicting views have been expressed concerning the origin of these objects. Helbig believes that they are all Etruscan, and represent only different phases of Etruscan civilization; and while to a certain extent there were overlappings in the method of disposing of the dead, there was in no case a break, such as would be caused by the intrusion of a strange race introducing new arts. The bronze arms and implements he considers of Phœnician and Carthaginian origin, of date not earlier than 900 B. C., or about the period of the entry of the Etruscans into Italy. Their identity with the relics found at Sybaris, which the Etruscans did not reach, and with articles in the lake-dwellings, which are supposed to be of much earlier date, are cited as militating against this view. Fiorelli and some other Italian archæologists maintain that they are relics of a primitive Italic civilization anterior to the Etruscan, and cite the community of the articles from such widely separated localities in support of their view. Gamurrini would identify them with a Pelasgic civilization.

A Ruined Bath.—A bath has been opened at Ostia, under the direction of Prof. Lanciani, which seems to have been struck by some disaster—perhaps an earthquake—while in full use, and to have been completely buried. The statues found there are broken as if by a fall on them of the masonry from above, and have been split vertically, while the fragments have been scattered to some distance from their bases.

Situlae, or Lot-Vases.—Excavations at various places in Upper Italy have brought to light a number of vessels of the class called situlae (or vases for the purpose of the lot), bearing peculiar decorations. One found at the Villa Benvenuti, near Este, is 12½ inches high, and is composed of two plates of bronze riveted together. It widens from the base in a curved shape to near the top, and terminates in a restricted neck and overhanging lip. Elaborate decorations are worked in three zones, toward the upper part of the vessel. A specimen from the tombs at the Certosa Bologna, is decorated in four zones, the lowest of which is composed of animals natural and winged, and the others are occupied respectively with military, religious, and pastoral subjects. Another situla at Bologna has three zones. Bronze specimens of allied character with these have been found at Castelvetro, Modena, and in Tyrol, but the more important specimens are from Cisalpine Gaul, or the immediately adjacent territory. The date of these works is uncertain, but Italian archæologists assign them to the latter half of the fifth century before Christ.

Greece. The Hellenic Society.—The Hellenic Society (London) has been active in connection with schemes of exploration, among which were the organization of the excavations undertaken in Cyprus, to be carried out by the director and students of the British School at Athens, and assistance to explorations in Asia Minor, which were conducted by Prof. Ramsay and Mr. Theodore Bent. Accounts of the work in which it had a part were given in the "Journal of Hellenic Discoveries." Special mention was made, in the report of the discoveries on the Acropolis at Athens, of the excavation by the German Institute of a temple of the Kabeiroi near Thebes; and of the excavations of the American School at Dionysos, to the northeast of Pentelicus, which had been identified as the center of worship of the deme of Icaria. Foundations of two shrines, of Apollo and of Dionysus, had been found, and some sculptured remains of high importance.

Discoveries in the Acropolis at Athens.—Among the objects disclosed by the excavations on the Acropolis is a head, one of the most ancient sculptures ever found upon that site, carved in Poros stone, and retaining a rich and brilliant coloring. The hair and beard are painted blue and the face red; and the pupils of the eyes are delineated with the chisel as well as painted in. The head appears to be that of a triton, the rest of the body of which, in the form of a serpent ending in the tail of a fish, was found

near the same place. At a later date were found a leaden vessel, quite shapeless through oxidation, and a portion of the torso of a statue of Hercules in Poros stone, half life-size.

Mr. Carl D. Buck, of the American School at Athens, has described in the "American Journal of Archæology" certain inscriptions, found on the Acropolis in December, 1887, of the fourth century before Christ, which record the dedication of vessels—apparently by freedmen who had been acquitted of the charge of violating the conditions of their emancipation.

Excavations at Sicyon.—The excavations carried on by the American School of Classical Studies on the site of ancient Sicyon in December, 1887, and January, 1888, were made mostly in the theatre. The orchestra was laid bare, and work was done in other parts of the building. Two drains were found. The sculptures include a marble hand grasping what might be the hilt of a sword, being a fragment of a statue of which no other part has been discovered; and a marble head and the torso to which it belongs, separated, appertaining to a statue representing a Dionysus "of youthful and girlish aspect" which was thought to belong to the Alexandrian epoch. This statue is the first considerable example of Sicyonian sculpture found on the old site. The main portion of the orchestra, like the theatre at Epidaurus, has no flooring other than hard earth. About thirty copper coins were found, part of them Sicyonian, and the remainder Roman. An inscription found in a village near the site consists of seven names, one of which contains the old Sicyonian form of Σ (χ). Its date may possibly be as early as 450 B. C.

Icaria.—In the course of the investigations begun by the American School at Icaria, the Pythian or Temple of Apollo was discovered, with a relief representing Apollo with long curls seated on the *omphalos*, holding a mass of twigs in one hand, and a patera in the other. Behind him stands a woman, while in front is an altar with an adorant. Another relief represents Apollo playing on the lyre. A large platform of marble, a marble-seat, some bases, and two walls, one of which makes a curve as if it might inclose the dancing-ground of a theatre, were also found.

Discoveries at Cephissus and Dionysos.—In their excavations at Cephissus, the American School discovered the head of a colossal male statue, a *basso rilievo* representing a warrior, a torso of a statue without a head, and many inscriptions.

Investigations at the spot known as Dionysos have brought to light fragments of draped statues of an archaic epoch supposed to belong to Dionysus; the torso of an undraped statue; the bearded head of a man, also attributed to Dionysus and referred to the sixth century, before Christ; and a headless *stela*, like the *stela* of Aristion which is to be seen in Athens. Many of these objects were found in the walls of a half-ruined chapel standing on the spot

and evidently built of old materials. The excavations have also laid bare a portion of the wall of the *peribolos* of the temple, and the bases of some votive offerings.

Statuettes at Tanagra.—At Tanagra has been found the tomb of a child, within which were thirteen statuettes of the same subject, representing a nude man pressing to his bosom with his left hand a cock. Several terra-cotta vases were found in the same place, of diverse forms, and for the most part ornamented with flowers (*anthemia*). One of the statuettes found at the same time represents a woman standing; another, an old woman with a babe in her arms; another, a youth standing clad in a chiton, with a purse in his right hand, and a chlamys hanging from his left arm. Others represent women seated, two naked children seated, a naked child squatting on its heels, three men seated, and one man standing.

The Temple of Aphrodite at Cerigo.—A report on the remains of the ancient temple of Aphrodite in Cerigo has been made by Dr. Schliemann to the Berlin Society of Anthropologists. The site is identical with that of the Church of the Holy Kosmos; and the stones of the ancient sanctuary almost sufficed for the erection of the church. The temple was a closed structure made of tufa-stone, with two rows of Doric columns, four on each side, of extremely archaic style. They are still preserved in the church, with their capital and ornaments; but only two of them, as well as the base of a column, are *in situ*. On a hill-top in the neighborhood are remains of Cyclopean fortifications, which Dr. Schliemann thinks, from the character of the potsherds found, can not be older than the seventh century before Christ.

The Rock-Cut Tombs of Mycenæ.—The excavations at Mycenæ continue to reveal fresh tombs, so that the extent of the necropolis can not yet be inferred. It appears, however, that all the land surrounding the ancient city, except where it was unsuitable, was used for burial. The tombs are on the slope of the hill, and consist of one or two chambers, which are reached by passages either horizontal or having a downward inclination, sometimes more than 20 metres long and 2 or 2½ metres broad. The chambers are 35 or 40 square metres in area, and constructed with great care. They appear to have been family vaults, and to have their doors and passages carefully hidden, to protect them against spoliation. The skeletons are imperfectly preserved, and seem to have been disturbed whenever fresh interments were made; they were simply laid out at full length, or placed in a sitting posture. The tombs are ascribed to an earlier date than the Homeric age, and even to a time as far back as 2000 B. C. They have yielded some objects that had not been found in other tombs of the same date—such as bronze mirrors, small knives that served as scissors, and razors, which are now shown to have been in use even in those early times. The most abundant

articles are beads that belonged to necklaces. They vary in shape, and are chiefly of glass; but some are of stone as large as a franc-piece, and engraved on one side with pictures of animals; and some are of onyx or natural crystal. A silver vase in the shape of a *phiale*, 0.18 metre in diameter, and having one handle, is adorned on the outer side of its rim with faces of men in gold, and a golden ornament under each. The character of the articles is described as mostly Eastern.

A Theatre and Temple at Mantinea.—The excavations made during 1887 and 1888 by the French Archæological School at Mantinea began with the clearing of the theatre, which was built of the common stone of the district, and presents some peculiar features. While parts of the building are so ruined that their ancient form can not be reconstructed, the conduits by which the rain-water was carried off are in comparatively good preservation. Near this building are the foundations of a temple, which may be the temple to Hera spoken of by Pausanias; but no inscription has been found by which to determine to whom it was dedicated. This foundation and the remains of the temple are both very near the surface of the soil. A large semicircular building, of which about a metre in height of the walls is left, gave the inscription *Κύαλος ὁ πρὸς τὸ γυμνάσιον*. In front and alongside of it were large double *stoai* which may have formed part of the gymnasium. The wall of the circuit of the town, in a fair state of preservation to the height of a metre or more, is built of large polygonal stones, and is 20 stadia in perimeter; more than a hundred of its towers are preserved. The roads mentioned by Pausanias as named after the respective towns have been discovered. Among the less massive relics are the pieces of sculpture by Praxiteles recorded by Pausanias as being in the temple of Leto, including on one pedestal a representation of the muses and of Marsyas playing on the flute; a number of inscriptions, one of which records the name of the great general Philopœmen; some terra-cotta tablets, which are supposed to have been theatre-tickets; and votive tablets. The stones of the ancient city have been liberally used in the construction of the houses of the modern town; and some of the most interesting objects were found walled in within the sanctuary of the Byzantine church.

Cyprus. Temple of Aphrodite at Old Paphos.—A "Cyprus Exploration Fund" has been formed, under the auspices of the Society for the Promotion of Hellenic studies, to carry out on the island of Cyprus the same kind of work of identification and recovery of remains of antiquity that has been successfully accomplished in Palestine, Asia Minor, and Egypt. It is under the care of a special committee of persons interested in archæological research. Permission was obtained from the authorities to excavate at Kouklia, on the site of the ancient Paphos, and operations were begun there in

December, 1887, under the supervision of Mr. Ernest A. Gardener. Excavations were also made in January, 1888, by Mr. M. R. James at the hill Leontari Vouno, Nikosia, in the course of which were discovered traces of early houses and walls, deep cuttings in the rock, a massive fort, primitive walls mixed with early pottery and other objects pointing to a remote period, and archaic tombs. In the tombs were found about two hundred vases, with fragments of pottery and broken articles of bronze, lead, and copper.

The temple of Aphrodite, at old Paphos, was cleared out, and a large portion of the walls was laid bare. The majority of the walls were found to belong to the restoration of the temple made by Tiberius; but the Romans appear to have made changes in the orientation of the parts of the structure that they touched, so that difficulty was met in tracing an accurate plan of the work. The plan of the temple falls into two main divisions—the south wing, standing detached, and a quadrilateral, containing various halls and inclosures. The south wing appears to be the earliest part of the building of which any traces remain. It consists of a large hall or court, bounded on the west by a wall of massive blocks. Between this court and the great quadrangle are remains of some irregular chambers and some pier bases, which may have been part of a triple avenue leading to the court. The rest of the site is occupied by buildings of later construction, of which, beginning at the south, the first to attract attention is a great hall or stoa, with a row of columns down the center. The construction is Roman, but it probably retains the general character of earlier buildings; and of such earlier chambers sufficient traces remain to allow of a fairly accurate restoration. A considerable number of inscriptions, a marble head of Eros, said to be “a valuable acquisition to the treasures of Greek art,” fragments of bronze and terra-cotta, a fine bronze-gilt pin, and a crystal cylinder belonging to a scepter, were found in the temple. Among the inscriptions in the Cypriot syllabary was a tablet containing a letter from Antiochus to Ptolemy Alexander, a tablet bearing a list of contributors to a feast called the Elaichristion, and a tablet bearing an elegiac inscription recording that at the suggestion of King Nikokles the town was fortified. Most of the inscriptions were on the pedestals of statues dedicated in the temple in Ptolemaic times, which confer much light on the constitution of Cyprus during that period. Some very interesting objects were found in the tombs of various periods that lie below the temple on the slope toward the sea. A third work of excavation was carried on at Anargeth, which was identified as the site of an ancient village, probably called Melantha, where Apollo was worshipped under the title of Opaon.

Perforated Monoliths.—Some curious perforated stones—monoliths—near Anoyra, in the Lima-

sol district, have been examined by Dr. F. H. H. Guillemard. They are similar to two monoliths at Kuklia, which are described by Cesnola, and have been regarded as Phœnician, and, perhaps, Phallic. Twenty-seven such stones have been found at Anoyra, all of a hard limestone. They are usually two feet in depth, and from 2 feet 5 inches to 4 feet 3 inches in width, while the hole is generally about 9 inches wide, and from 2½ to 4 feet high. The height above ground ranges from 6 to 10 feet. These stones are believed by Dr. Guillemard, from their situation and accompaniments, to have been parts of mills or of olive-presses. Others believe that though they may have been adapted and utilized for such purposes as these, they were originally Phœnician, or prehistoric, and Phallic.

Ancient Sites in Asia Minor.—Mr. J. T. Bent, giving an account to the British Association of some discoveries that he had made in Asia Minor, said that during a cruise along the south coast of that country, he had found the sites of three ancient towns and identified them by inscriptions. In one place were thirty-three inscriptions, many of them of great local interest, introducing a doctor, Aristobulus by name, who is mentioned by Galen, and numerous consuls and pro-consuls of Rome, who ruled there. Local offices and dignitaries, family names and customs, are referred to in all these inscriptions. At about five miles from Lydæ, inland, the author discovered the ruins of a fortress buried in a thick forest overlooking a lake, and identified the place from inscriptions as Lissa.

Egypt. Exploration Fund.—The Egypt Exploration Fund, in acknowledgment of liberal contributions to its resources (which amount to fully one half of its fund) from the United States, has authorized the presentation to the Museum of Fine Arts, in Boston, of a selection of Greek antiquities from Naukratis and of Egyptian antiquities from Nebesbet, the city of Onias, and Bubastis, and of a statue of heroic size of Rameses II.

The work of the fund for 1888 was begun by Mr. F. Llewellyn Griffith on the mounds of Kûm abû Billâ, at Tarrâneh, on the western edge of the delta. The site is supposed to represent an ancient city named Terenuthis. The remains yielded little that was of interest, and the work was discontinued.

Hyksos Monuments at Bubastis.—The excavations on the site of the great temple of Bubastis were resumed on the 28d of February, 1888, by Mr. Edouard Naville, with Mr. F. Llewellyn Griffith, Count d'Hulst, and the Rev. Mr. MacGregor. The two pits formed in 1887 were thrown into one, and the ground was cleared from east to west, following the axis of the temple till the whole width of the building was laid bare. Among the discoveries were a third hall built by Osorkon I, of red granite lined with sculptured slabs; the remains of a colonnade; a monolithic shrine in red granite; two

statues of an officer named Amenophis, inscribed with the cartouches of Amenophis III, and the torso of a woman of the same epoch; traces of Amenophis IV (or Khu-en-Aten) in the shape of the name of that king's patron deity. The results of the investigations brought up the number of the names of the kings who had left traces of their work here to twenty-two, beginning with Pepi Merira, of the sixth dynasty, including Usertesen III, of the twelfth dynasty, and ending with Nectanebo.

Evidences associating the site with the rule of the Hyksos kings were found in the shape of an architrave sculptured with the cartouch of Apepi, and the remains of three statues of this period. One of these was headless, but was seated upon a throne, with cartouches and standard, giving the family name, the throne name, and the "banner" name of the king in a perfect state of preservation. This is the first instance in which a Hyksos statue has been found with a legible inscription. The inscriptions read as follows: "The divine Horus who embraces the lands, the good god Userenra, the son of Ra, Raian, loving his Ka, everliving." This name, Raian, is new to the Egyptian monuments, although it suggests a curious coincidence with an Arab tradition of the going of Joseph to Egypt, which, as given by Mas'ûdi, relates that "the Hamites who peopled Egypt had been for some time ruled over by women, in consequence of which kings from all quarters were lusting after their land. An Amelkite king named al-Walid invaded it from Syria and established his rule there. After him came his son, Rayyân ibn al-Walid, in whose time Joseph was brought to Egypt."

Mr. Petrie has adduced reasons, from the readings on two cylinders bearing the titles of this king, for supposing that the name should be read Khian rather than Raian, and that this makes his connection with the Rayan of Arab tradition almost impossible. The Rev. Henry George Tomkins, however, has suggested that "if we must read Khian, the name may still be intended by the IANNAZ of Manetho, with rough breathing," and adds "that in this case we may find for the first time traces of a Hyksos proper name in northern Syria; for Assur-nazirpal received tribute from Khaian or Khindani 'on the further bank of the Euphrates,' that is, on the western side, south of the junction of the Khabûr. And Shalmaneser took tribute of Khaian, the son of Gabas, in northern Syria toward the west. There are local traces of such a name, especially the ancient ruins and great tanks of Khurbet Haiyan, east of Bethel, which have been thought to mark the site of the important Canaanite city Ai or Hai."

Mr. F. Llewellyn Griffith has compared the prenomen of the king as given on this statue—Ra-suser-n—with the name inscribed in imperfect characters in the cartouch of a black granite lion from Bagdad, in the British Museum, which presents some resemblance to it.

This lion is one of a class of sphinxes in black granite that have been found at several sites in Lower Egypt, and are assigned to a period previous to the eighteenth dynasty.

Portraits of the Greco-Roman Period.—Mr. Petrie placed on exhibition in London the objects that he recovered in the exploration of a vast cemetery, which he found near the pyramid containing the tomb of Amenemhat III. The cemetery proved to be one of the Ptolemaic and Roman epochs, and furnished many new facts respecting the dress, mode of burial, etc., of the Hellenized and Romanized Egyptians of the three or four centuries before and after the Christian era. The mummies of two or three earlier centuries had gilt sculptured head-pieces, and those dating from about A. D. 150 had portraits inserted in the place of the head. These portraits, of which there were more than thirty, were painted, apparently in colored wax, upon very thin wooden panels, and are preserved in all their freshness. Many of them are said to be wonderfully expressive; one, representing the face of a man of mature age, "is modeled with singular force and skill," and four are "excellent portraits" of ladies. These heads were slipped into the mummy-case, and it appears to have been the custom to keep the mummy, thus adorned, for several years in the house of the family. An important fragment of papyrus, containing a transcript of a part of the second book of the Iliad, beautifully written, is included in the collection, and with it is the skull of the owner, a lady, with shreds of her hair twisted over it.

The Pyramid and Statues of Lake Mœris.—The researches of Mr. W. M. Flinders Petrie in the Fayoum have brought to light what are supposed to be the remains of the structures described by Herodotus as two pyramids crowned with colossal statues standing in the midst of Lake Mœris. At Beyahmu, a village about four miles north of Medinet-el-Fayoum, ruins destitute of inscriptions and called *Kursi Far'un*, or Pharaoh's chair, had been already remarked and described by Ebers as resembling dilapidated altars rising above other fragments of solid masonry. Ebers had also suggested a connection between these objects and the pyramids of Herodotus. Mr. Petrie found that they were, in fact, two piles of masonry standing on two stone platforms, at the corner of one of which was an angular block of some sloping structure, like the corner of a pyramid. The piles of rubbish in which the ruins were half imbedded, were found to contain a vast number of fragments of limestone, red granite, and a hard and highly polished yellow quartzite sandstone. A search among these fragments soon brought out scraps of hieroglyphic inscription, a morsel of bass-relief paneling, and a royal oval containing the name of Amenemhat III—the Mœris of Herodotus. As the search was continued, numerous chips were found containing bits of detail, or wrought in the likeness of the undulating surface of the

human body, scraps of ornamentation such as are carved on the thrones of the colossi of the period of the twelfth dynasty, and, finally, a polished sandstone nose measuring eleven and a half inches in width. From this feature, Mr. Petrie estimates that the statue, when perfect, must have been about thirty-five feet high. The masses of fragments about the other altar give hope that similar remains of a second statue may be found there. The pedestals are twenty-two feet high. Supposing the statues to have been set upon a base three feet high, the total elevation of the figures above the ground is estimated to have been sixty feet. Each pedestal appears to have been surrounded by an open court, walled around to about the height of the base of the statue. As these walls inclined inward, like the sides of pylons and pyramids, the effect when viewed from a distance would be precisely that of a truncated pyramid surmounted by a seated statue. The exaggerations by Herodotus of the heights of the monuments—which he gave as “fifty fathoms above the surface of the water, and extending as far beneath”—as well as of the size of Lake Mœris, are ascribed to his having visited the country during the inundation, and to his having been misled by his guides, who were probably no more trustworthy than the dragomans of the present day.

Mr. Cope Whitehouse, on the other hand, who has made a survey of the depression called the Raian basin, to the south and west of the Fayoum, believes that he has found there the site of an ancient lake that was ample and deep enough to answer the description given by Herodotus as of Lake Mœris. It is described as being forty miles long, twenty miles wide, and more than two hundred and fifty feet deep, and connected with two other depressions, one of which is represented by the Birket-al-Keroun, and the other is the Gharaq basin. The Birket is fed by the canal called the Bahr Jusuf, which runs almost parallel with the river from Osioot, till it finds a pass through the hills and enters the Fayoum. After emerging from the pass it divides into four branches, running in different directions toward the Birket or different parts of the depression. A fifth channel may also be traced. Within the depression, near the northwestern edge, is a hill called Grande Butte, or Haram by the Egyptians, which may be the island described by Herodotus.

Documents in the Babylonian Language.—A large number of clay tablets and fragments of tablets inscribed with cuneiform characters have been discovered among the ruins of Tel-el-Amarna, in Upper Egypt, the site of the capital built by Amenophis IV, or Khu-en-Aten. They were discovered in the tomb of a royal scribe, and consist largely of letters and dispatches sent by the kings and governors of Palestine, Syria, Mesopotamia, and Babylonia, to Amenophis III and IV; and a note in hieratic on one of them says that a large portion of them had been

transferred from Thebes to the new capital of Khu-en-Aten, along with the rest of the royal archives. Palestine was held at the time by Egyptian garrisons, and the representatives of the Egyptian Government appear to have been active in sending home news about all that was going on. Among the cities of Palestine from which letters were dispatched were Byblas, Smyrna, Akko or Acre, Megiddo, and Ashkelon; and reference is made in one of the letters to a coalition, at the head of which was the king of Gath.

About three fourths of the whole number of the tablets have been deposited in the Royal Museum of Berlin and the British Museum. Among those in the Berlin collection are letters and dispatches from Tushratta, King of Mitanni; Burraurriyash, King of Karaduiyash; and other kings of parts of Mesopotamia. The fact is established in them that Tushratta was the father-in-law of Amenophis III, thus confirming the representations on the scarabei of that king, that he married a Mesopotamian woman. Among the eighty-five tablets acquired by the British Museum are several of considerable importance for the study of the relations which existed between the kings of Mesopotamia and Egypt. A dispatch from Tushratta to Amenophis III refers to a treaty which existed between the father of the former and Amenophis, and conveys proposals for a marriage between his great-nephew and the daughter of the Egyptian king. A dispatch from Burraurriyash to Amenophis IV, besides allusions to a treaty, mentions exchanges of gifts. Letters from the king of a country called Alashiya also mention gifts and negotiations, and ask for the return of the property of a subject of Alashiya who had died in Egypt leaving his family in the former country. Other dispatches are from Tushratta to the wife of Amenophis III, the greatly beloved Ti of the Egyptian monuments, who appears to have been the daughter of Tushratta, in which the proposed alliance of his great-nephew with Amenophis's daughter is again mentioned. Mr. A. H. Sayce has found in one of the inscriptions a mention of a *targumanam* or dragoman having been sent with a letter, giving the first example of the use of this word.

Memphis Colossi of Rameses II.—Major Arthur Bagnold described before the Society of Biblical Archæology, at its February meeting, the raising of the pair of colossal statues of Rameses II, at Memphis, which are mentioned by Herodotus and Diodorus as having stood in front of the temple of Ptah. One of them had been partly brought to light by Sloane and Caviglia, and Hekeian Bey once began to dig around it; and a cast of its face was in the British Museum. The colossus was raised by the aid of hydraulic apparatus, propped up, photographed, and then laid upon its back, in the position which it had before occupied. It is thought to have been about thirty-five feet high, but was broken off at the knees, and the

feet could not be found. It is admirably carved, and the face of the king is nearly perfect.

Tombs at Siout.—The rock-cut tombs of Siout, ancient Lycopolis, have been re-examined by Mr. F. Llewellyn Griffith, who made careful transcripts of all the extant inscriptions. Mr. Griffith determined the date of the great tomb known as Stahl-Autar, having found that it was excavated in the reign of Usertesen I, of the twelfth dynasty. He also discovered that the upper ranges of tombs in the same cliff belong to the hitherto unrepresented dynasties of Heracleopolis (the ninth and tenth dynasties of Manetho).

Book of the Dead.—**Ani Papyrus.**—A hieroglyphic papyrus containing a recension of the Book of the Dead, which was written for the royal scribe Ani, in the early part of the nineteenth dynasty, has been acquired for the British Museum. It is in excellent preservation, and, except for the absence of a character here and there, is complete, and contains some vignettes of rare beauty. The fact that it contains a chapter, the one hundred and seventy-fifth, which has not been found complete anywhere else, gives it an extraordinary value.

Early Christian Sculptures.—Many specimens of early Christian sculptures from Egypt show traces of the ancient pagan styles, and of the adaptation of them to the purposes of the Christian faith. In a very primitive presentation of the Virgin and Child, with a figure dressed in a dalmatica standing before them, from the Fayoum, the two principal figures are entirely nude, and are described as simply reproducing the well-known group in Egyptian art, of Isis suckling Horus; even the chair in which the Virgin is seated is of the same fashion as the chairs of the twenty-sixth or earlier dynasties. In a representation of a saint standing in a niche, the colonnettes are designed after columns of purely Egyptian temples. A bass-relief of St. George slaying the dragon has its counterpart in figures of Horus slaying Set. In a collection of Coptic textiles centaurs, sirens, cupids, and other fabulous figures from the pagan mythology appear as common ornaments. Of this character are a composition of the Triumph of Bacchus in the Museum of Lyons, and three embroidered pieces at South Kensington containing half-length figures of Apollo, Hermes, and Hercules, with their names inscribed on the background. In an *alto-rilievo* representing Christ and his apostles, also from Akhmin, and assigned to the period of Theodosius II or Marcian, the figures are arranged, standing in line, without attempt at artistic grouping, dressed in the style of Roman sculpture, and separated by a simple ornamental motive. Each of the heads is surrounded by a nimbus, that of our Lord being distinguished by a cross inside of the circle. These various objects combine, in the view of those who have examined them, to illustrate the artistic activity of the period forming the link between ancient and modern art.

Palestine. The Pool of Bethesda.—The Palestine Exploration Fund has announced the discovery by Herr Conrad Schick, near the Church of St. Anne, Jerusalem, of what may in all probability be identified with the Pool of Bethesda. An apparently uninterrupted chain of evidence from A. D. 888 to the year 1180 speaks of the *Probatia piscina* as near the church of St. Anne. The place spoken of is said by the earliest writers to have formerly had five porches, then in ruins. Recently the Algerian monks laid bare a large tank or cistern cut in the rock to the depth of thirty feet, lying nearly under a later building, a church with an apse at the east end. The cistern is 55 feet long from east to west, and 12½ feet in breadth from north to south. A flight of 24 steps leads down into the pool from the eastern scarp of rock. This pool was not, however, large enough to supply the first requisite for the Pool of Bethesda—that it should be possible to have five porches; but Sir Charles Wilson had pointed out that this condition could be fulfilled if there were a twin pool lying by the side of this one, so that the two pools could have one portico on each of the four sides, and one between them on the wall of separation. Such a pool has been since discovered by Herr Schick. It is 60 feet long, and of the same breadth with the first pool. The pool is therefore concluded to be undoubtedly the one pointed out by the writers as the *Piscina Probatica*; and it affords ample room for the five porches spoken of in the Gospel, as well as for the five porticos—which were probably the same—which are spoken of by the "Bordeaux Pilgrim" as being then there in ruins.

The Walls of Jerusalem.—The topography of ancient Jerusalem has been difficult to make out, and the site of the sepulchre of the kings of Judah remains unknown. But the problem has been simplified by recent excavations, the bearing of which was explained in the British Association by Mr. George St. Clair. We now for the first time know the contours of the rock and the features of hill and valley before the 80 feet of *débris* began to accumulate. The Akra of the Maccabees being defined, it is seen how, by the recorded filling up of the Asmonean valley, the two parts of the Lower City became joined into one crescent, lying with its concave side toward the Upper City, according to the description of Josephus. The investigations of Sir Charles Warren show that the temple must be placed on the summit of Moriah, with Solomon's palace southeast of it, leaving a vacant square of 300 feet where now we have the southwest quarter of the Haram area. From the southeast quarter of the Haram inclosure extends the wall of Ophel, discovered by Warren, running 76 feet to the south, then bending toward the southwest. Further, it is found that from the Gate of the Chain, in the west wall of the Haram inclosure, a causeway, with complicated structures, extends westward toward the Jaffa Gate. Having this ground-

work, we may proceed to place the walls. The third wall, built by Agrippa, does not concern us. The site of the second wall has been partly fixed by Herr Conrad Schick. The first wall was the wall of the Upper City. On the northern side it ran from the Jaffa Gate to the Haram wall. The uncertainty has been about its southern portion. The investigations of the author have led him to adopt a line that corresponds in detail with the descriptions in the Book of Nehemiah. Taking Nehemiah's night survey, then the consecutive allotments of work assigned to those who repaired the walls, and, thirdly, the points successively reached and passed by the processionists when the walls were dedicated, it is shown that every mention of a gate or a tower, the number and order of the salient and re-entering angles, and every other note of locality, exactly agree with the course of the walls as suggested. This course, moreover, involves the least possible variation from the present line of walls, and that more in the way of addition than of deviation. The hypothesis commending itself as true by corresponding minutely with Nehemiah's description, by tallying exactly with other Biblical references, and by meeting all the other requirements of the case, it has the important practical bearing that it indicates the site of the royal sepulchres, of the stairs of the City of David, of "the gate between the two walls" etc., and shows that Zion was the eastern hill.

Hittite. Characteristic Figures of the Inscriptions.
—In a course of lectures at the British Muse-

um, Mr. Thomas Tyler expressed it as the currently received opinion that there probably never was a Hittite empire in such a sense as the word empire now suggests. The view that the nation consisted of independent states or cities, which formed federations under pressure of the necessities of war is apparently confirmed by the expression, "King of the Hittites," used in the Old Testament. These peoples are to be identified with the Khita of the Egyptians and the peoples of the country of the Khatti mentioned on the Assyrian monuments. Some of the personages among the representatives of the Hittites on Egyptian monuments, and also figures of persons in authority found at Jerablus, or Carchemish, are represented with the "pig-tail," while other figures are in long hair without this style of dress. This would indicate—supposing the mass of the population to have been Semitic or of allied race—that there was in some of the cities at least, a ruling stock of another race, which may have been Tartar. On the opposite sides of the walls of the great chasm of Bogaz Keui are processions, one of male the other of female figures which meet at the head of the ravine, where a gigantic male figure, standing on the bent-down heads of two persons with long robes, and a female figure standing on some animal and wearing a mural crown are presenting floral symbols in which is a form like that of the mandragora or mandrake, to each other. The figures in the female procession, each bearing what resembles an unstrung bow, remind the observer of the Amazons; and it is a striking fact that Bogaz Keui is not far from the place, by the river Thermodon, to which the Greeks assigned the Amazons. If the story of the Amazons was purely legendary, these sculptures might be regarded as showing that it was believed in in what might be regarded as their own country. A seal lately obtained from Yussat, now in the British Museum, is considered to cast some light on the nature of the Hittite inscriptions. It is circular and contains solar, devo-

CENTRAL BAS-RELIEF AT BOGAZ KEUI.

um, Mr. Thomas Tyler expressed it as the currently received opinion that there probably never was a Hittite empire in such a sense as the word empire now suggests. The view that the nation consisted of independent states or cities, which formed federations under pressure of the necessities of war is apparently confirmed by the expression, "King of the Hittites," used in the Old Testament. These peoples are to be identified with the Khita of the Egyptians and

tional, and symbolical designs, with a male figure bringing tribute or a present, and a female making obeisance to a king sitting on a throne, behind whom are other figures symbolical, perhaps, of the spoils of war or the hunt. The design is analogous to a portion of the doorway inscription from Jerablus, in which oxen, asses, and other valuable possessions, the spoils of war, are presented to a king wearing a pigtail and a conical cap. A quadrangular seal from Tarsus, en-

graved on five faces, bears on one face two figures presenting a floral symbol resembling the mandrake, while of seven other principal figures, two, one having the head of a hawk, wear the pigtail. All the figures have the toes turned up, as in what are called the Hittite boots. Figures also occur resembling the *crux ansata*, or symbol of life, of the Egyptian monuments.

The Stela of Fassiller.—Mr. Sterrett, of the American School at Athens, describes the discovery at Fassiller, not far from the site of Lysitra, in Isauria, of a monument of the same class of the sculptures at Bogaz Keui, Euyuk, and Gaur Kalesi. It is an immense monolithic stela, now lying on its back, and contains the figures of two men and two lions in very high relief. Occupying the center of the stone, at the bottom, is an erect human figure, clothed in a gown draping the whole of it, to the ground. The hands are clasped on the breast, with the chin touching them. The head-dress seems to be a helmet; its mouth is open; its ears and eyes are very large. On either side of this figure stands a lion, full face, about as tall as the man without his crested helmet, and with the legs not divided; that is, the curvatures alone are indicated, while the mass of stone between the legs has not been dug away. Above the human figure is a second figure of a man striding forward, his left foot, which is in front, supporting his whole weight. This foot rests on the top of the crest of the helmet of the lower figure; but the feet are not chiseled out, or even indicated. The legs are merely straight lines. The right hand is raised, and holds a round object, with something projecting from it vertically on one side, while a large object is held under the left arm. This object reaches to the feet, but diminishes in size and relief, till at the foot the relief is very slight. On the head is a grand tiara, with four divisions or bosses. The whole height of the stela is 7.23 metres; width at bottom, 2.75 metres; thickness at top, 0.32 metre. A circular seal having a string-hole, was engraved on one of the two convex sides with a human figure having an ox's head and wearing the boots with turned up toes, and with a design on the other side that could not be made out.

Babylonia. Babylonian Exploration Fund of Philadelphia.—An exploring party has been sent out to Babylonia under the auspices of the Babylonian Exploration Fund of Philadelphia, and sailed from New York on the 23d of June. It consists of Dr. John P. Peters, director, with his assistant, Mr. J. D. Prince; Dr. Hilprecht, of the University of Pennsylvania, and Dr. Harper, of Yale, Assyriologists; Mr. P. H. Field, architect; and Mr. J. H. Haynes, photographer. Arrangements were made for carrying on the work for one year, its continuance to depend upon the success achieved during that time. The Babylonian Exploration Fund was organized in Philadelphia, in November, 1887, under the presidency of Dr. Pepper, Provost of the University of Pennsylvania, and

obtains its funds through the subscriptions of citizens.

The Temple at Sippara.—In describing the temple that Mr. Rassam has discovered at Abou Hubba, the site of the ancient Sippara, or Sepharvaim, Mr. W. St. Chad Boscawen has pointed out the close resemblance that it presented to the Jewish temple. Its internal arrangements and even the names of the different portions were identical with those of the Jewish temple. The Holy Place (*hekal*) was separated from the Holy of Holies (*parako*) by a veil. In the civil portions of the temple a close parallel was presented to those of the Mohammedan mosque. The temple was the treasury; it was also the school, and, like the mosque, was supported by a glebe or *wakuf* estates and a regular tithe. Several thousand tablets had been discovered by Mr. Rassam in the treasury of the temple, covering a period extending from the fall of Nineveh, 625 B. C., until the time of Alexander the Great. These archives throw much light upon all branches of Babylonian social customs, and make possible a restoration of the life of the people in the by-gone past with the fullest detail. Among the tablets is one recording the payment of the tithes by the *major domo* of Belshazzar, and a list of the dues paid by the prince himself in behalf of himself and his father. The date of the reign of the older Sargon, as given on the cylinder of Nabonidus which was recovered in this temple (about 3800 B. C.), may be regarded as correct. The historical statements on the same cylinder are in all other particulars accurate. Among the other inscriptions found on this site, were some cylinders recording the restoration of the great canal known as the Nahr Malka by Khammurabi, who reigned about 2200 B. C. These inscriptions, coupled with others written nearly fifteen centuries later by Nabopolassar, show that during that long interval the Euphrates had shifted its course to the west. In Sargon's time (3800 B. C.) the river no doubt flowed close to the walls of Sippara, but in 2200 B. C. it had removed so far west that a canal had to be cut to connect the city with the river, and in 550 B. C. this canal had to be still further prolonged to meet the still receding river. These facts afford evidence of the antiquity of the city.

Africa. The Caves of the Troglodytes.—The caves of the troglodytes, near Ain Tarsil, about three days' ride southwest of the city of Morocco, have been visited and partly explored by a correspondent of the London "Times." They had been previously visited by Balanza and Sir Joseph Hooker, who mention them but did not explore them. They are situated in a narrow gorge, or cañon, the cliffs of which rise almost perpendicularly from a deep valley, and are cut in the solid rock at a considerable height from the ground. In some places they are in single tiers, and in other places in two or three tiers, one above the other, and ordinarily inaccessible, except by ropes and ladders. The

entrances to the caves vary from $3\frac{1}{2}$ to $4\frac{1}{2}$ feet in height, are about 3 feet broad, and give access to rooms of comfortable size, furnished with windows, which were in some cases connected with other smaller rooms, also furnished with windows. The appearance of the caves is hardly consistent with the conception of the troglodytes as savages, which has been drawn from Hanno's account of them. For these abodes show signs of great labor, and indicate that their builders, in making the floors and ceilings perfectly smooth, and putting more than one window in the same room if it was a large one, had ideas of care and comfort.

Russia. *The Tomb of a Scythian King.*—Interesting and important discoveries have been made in the exploration by the Russian Imperial Archaeological Commission of the mounds of that district of the western Caucasus which is traversed by the river Kuban. One of the most important of them—the Great Kurgan near Krymskaia—consists of three chambers, extending through a length of 67 feet. The walls are of massive, well-hewed slabs of stone, stuccoed and frescoed, and the floor, of stone slabs, is laid in cement. The first of these chambers contained numerous archaeological relics of earthenware, silver, engraved beads, remains of an iron wheel and of two horses, and the skeleton of a young woman of high rank, with a triangular golden plate bearing figures in relief, which formed part of her tiara, and other personal ornaments of gold. The second room contained a few relics. In the third, or principal room, was a skeleton, which is presumed to be of a Scythian king, having around its neck a thick golden unclosed hoop, bearing figures at the ends; near it a golden plate, which was probably part of head-dress, and around it silver drinking-horns and drinking-cups, a silver quiver overlaid with gold and adorned with figures, copper arrows, and iron spear-points. Remains of rotten boards and nails indicated that both bodies had been inclosed in coffins. The relics are assigned to a date not much later than the Christian era, and are believed to represent an age of Scythian arts and customs of which little has hitherto been known.

ARGENTINE REPUBLIC, an independent republic of South America. (For details of area, population, etc., see "Annual Cyclopædia" for 1883.)

Government.—The President is Dr. Juarez Celman, whose term of office will expire on Oct. 12, 1892; the Vice-President is Dr. Carlos Pellegrini. The Cabinet was composed of the following ministers: Interior, Dr. Eduardo Wilde; Foreign Affairs, N. Q. Costa; Finance, Dr. W. Pacheco; Justice, Dr. F. Posse; War and Navy, Gen. E. Racedo. The Argentine Minister at Washington is Don Vicente G. Quesada, and the Consul at New York, Señor Adolfo G. Calvo. The American Minister at Buenos Ayres is Bayless W. Hanna, and the Consul, Edward L. Baker.

Finance.—On March 31, 1888, the foreign indebtedness of the republic amounted to \$92,427,000; the domestic debt, at the same date, amounted to \$47,000,000; total, \$139,427,000. The provinces have besides a foreign debt of \$88,219,611, and a domestic debt of \$25,000,000. The income in 1887 was \$58,185,000, and the expenditure, \$50,019,000.

The law making the authorized note-circulation of banks a legal tender will expire on Jan. 9, 1889, when it will forcibly have to be renewed. On June 15, 1888, the Government had in circulation \$6,000,000 of fractional paper money. In 1887 the gold premium at Buenos Ayres averaged $35\frac{1}{2}$ per cent., as compared with $38\frac{1}{2}$ in 1886, and 37 in 1885. Early in May, 1888, the Government held \$77,000,000 gold coin, ready to moderate the premium. A bridle has been put on wild stock speculation by limiting the delivery of stocks on time sales to thirty days. Since 1880 the Argentine Government, provinces, railroads, etc., have contracted loans to the amount of \$805,810,000; out of this amount only \$43,080,000 went toward canceling matured bonds. Several new loans were negotiated in Europe during 1888; one for £7,000,000 for the conversion of outstanding Government bonds from 6 per cent. interest to $4\frac{1}{2}$ per cent.; £2,000,000 in behalf of the city of Buenos Ayres; £2,000,000, city of Rosario; £2,000,000, province of Córdoba; £1,000,000, province of Santa Fé; £600,000, province of Tucuman; province of Mendoza, £1,000,000; province of San Juan, £1,000,000; province of Entre-Ríos, £1,200,000; and, province of Corrientes, £1,000,000; together, £21,200,000. The bank of the province of Buenos Ayres also floated a \$20,000,000 loan in Germany. During 1887 the national bank increased its capital by \$12,000,000, and the following banks were founded: The German and Rio de la Plata Bank, capital on shares, \$2,000,000; the French Bank, \$2,000,000; the new Italian Bank, \$2,000,000; the Argentine People's Bank, \$1,000,000; and the Buenos Ayres People's Bank, \$3,000,000; the Banco de Córdoba increasing its capital \$500,000.

On June 15, 1888, the total note circulation of banks was \$87,925,000. On June 15, 1887, it was \$79,000,000. The banking and currency of the Argentine Republic have been in an extremely unsettled condition for several years. A resolute attempt to put them upon a better basis was made in the law of Nov. 3, 1887, which made banking practically free, and provided a national currency guaranteed by national bonds bearing $4\frac{1}{2}$ per cent. interest in gold. These bonds are delivered to any banking institution that submits to the required Government inspection, for 85 per cent. of their par value, and may be deposited as security for an issue of bills up to the face value of the bonds.

Army and Navy.—The army of the republic exclusive of the National Guard, according to official returns of June, 1887, was 6,256 strong,

comprising 2,945 infantry, 2,571 cavalry, and 740 artillery. The National Guard was 400,000 strong.

The navy consists of 38 vessels, mounting 73 guns, of a total tonnage of 16,612, with 18,055 indicated horse-power, and manned by 1,966 sailors. There are three iron-clads, four cruisers, four gun-boats, seven torpedo-boats, four steam transports, and sixteen smaller steam and sailing craft.

Railroads.—The lines in operation in the summer of 1887 were as follow :

	Length in kilometres.
Government lines	1,374
Lines belonging to the province of Buenos Ayres	989
Lines belonging to the province of Santa Fé	298
Lines belonging to the province of Entre-Ríos	236
Private lines	3,701
Total	6,648

There were in course of construction 1,651 kilometres, to which will be added 7,925 kilometres of new lines, at a total cost of £58,500,000, on which the Government has undertaken to guarantee 5 per cent. interest, with the exception of the Formosa-Tarija line. on whose cost only 4½ per cent. is to be guaranteed. The Argentine railroad system forwarded in 1887 7,657,406 passengers, and 8,705,876 tons of merchandise. The gross earnings were \$28,805,722, and the running expenses \$13,177,772 leaving net earnings to the amount of \$10,627,950. During 1886 and 1887, concessions were granted for the building of 17 lines of railway; in 1888 there were 84 applications for concessions to construct new lines.

In 1888, 200 kilometres of tramway, out of a total of 600 kilometres to be constructed in the immediate vicinity of Buenos Ayres, were in working order.

Telegraphs.—The lines in operation in 1887 were owned and operated as follows :

LINES.	LENGTH IN KILOMETRES.			Offices.	Employees.
	Miles.	Wires.	Cable.		
State lines	18,017	80,668	78	407	1,305
Private lines	5,164	12,135	63	261	853
Total	23,181	92,803	141	668	1,657

There were added to the Argentine telegraph system in 1887, 3,400 kilometres of line, and 4,000 kilometres were repaired. There were in course of construction 850 kilometres of state lines. The number of private telegrams sent was 651,280; Government messages 85,049. The receipts rose from \$271,441 to \$337,497; the expenses amounted to \$515,425.

Postal Service.—The number of post-offices in 1887 was 672. The number of letters handled in 1886 was 24,862,842, of which 1,188,361 were Government dispatches, and 3,494,564 foreign letters; newspapers, 19,993,472, of which 2,185,324 were foreign.

New Steamer Lines.—A contract was made in January, between the Government of the

Argentine Republic and Robert P. Houston, of England, by which the latter agrees to construct ten steamers, of at least 4,000 tons burden and a speed of 16 knots an hour, to ply between the north of Europe and the ports of the Argentine Republic, and four steam-launches for emigrant service in Europe. Also four steamers to ply between the United States and the ports of the Argentine Republic. The principal conditions of the agreement are the following : The Government of the Argentine Republic guarantees a loan of 5 per cent. per annum on £1,250,000 for the European service, and 5 per cent. per annum on £360,000 for the United States line. The contractor for the European service agrees that these steamers shall always fly the flag of the Argentine Republic, and that, in case of war, the Government shall have the option to buy them at a sum not greater than their original cost. Exceptionally good accommodations are to be provided for emigrants.

In case the revenues of the contracting company exceed five per cent., it will refund to the Government from this excess the sums it has received as guarantees, and in case the revenues reach ten per cent., the excess is to be divided between the Government and the company. The guarantee terminates at the end of eighteen years. It is stipulated that in going from Europe the steamers must not call at any port except Montevideo and places where it is customary to take coal; but on the return trip they may call at any port. One of the steamers must arrive in the Argentine Republic at least once a week. Passenger and freight rates are to be fixed by agreement between the Government and the company. The company also agrees to furnish each steamer with a refrigerator capable of holding at least 3,000 dressed sheep or an equivalent amount of beef. The service is to begin in February, 1889, and by the following November all the steamers must be running.

The United States service will be performed under similar conditions, except that no refrigerators are to be placed on these vessels.

Commerce.—In 1886 there entered Argentine ports 4,727 sailing-vessels, with a joint tonnage of 764,238 tons, and 6,288 steamers registering 2,751,052 tons. In 1887 the increase in the arrivals was 4,000 vessels, with a total tonnage of 1,000,000.

The foreign trade of the Argentine Republic for six years has been :

YEARS.	Imports.	Exports.
1882	\$61,244,000	\$60,880,000
1883	60,485,000	60,307,000
1884	64,056,000	68,029,000
1885	52,221,000	53,579,000
1886	97,658,000	69,534,000
1887	116,292,000	88,527,000

The revenue collected from customs was \$44,114,000 in 1887, an increase of thirty per cent. over 1886.

The Argentine foreign trade was distributed in 1886 as follows (in thousands of dollars):

COUNTRIES.	Import.	Export.
England	38,439	10,071
France	17,009	23,343
Belgium	7,821	10,994
Germany	8,044	6,951
Italy	4,647	2,476
Spain	3,717	1,166
Holland	780
United States	7,648	3,580
Brazil	2,809	1,948
Uruguay	6,417	2,767
Chili	68	2,819
Paraguay	1,418	419
West Indies	90	1,184
Other countries	4,845	8,742
Total	97,658	69,884

The Argentine Republic is rapidly advancing toward the position of an important grain-exporting country. Immense tracts of pasture are being converted into farmland. A few years ago not sufficient wheat was raised to supply the home market. The number of reapers imported into the country last year was 1,429. The chief exports of Argentine products in 1887 were: Indian corn, 861,000 tons; wheat, 238,000 tons; linseed, 81,000 tons; jerked beef, 19,800 tons; wool, 240,000,000 pounds (against 290,000,000 in 1886); sheepskins, 67,000,000 pounds; cattle, 110,000 head.

The American trade with the Argentine Republic is shown in the following table:

YEARS.	Import into the United States.	Domestic exports to the Argentine Republic.
1885	\$4,775,616.	\$3,964,190
1886	4,354,890	5,020,835
1887	4,977,018	5,911,027

Beginning with the year 1888, the export duty on wool and all products emanating from stock-raising has been abolished. An octroi, or consumption-tax, is charged on all goods leaving the bonded warehouses for local consumption, but from this tax several articles are exempted, paying from 2 to 60 per cent. import duty. The free list remained the same as in 1887.

A French syndicate has conceived the plan of organizing a service of towing, by means of tug-boats, vessels through the Straits of Magellan, between the Atlantic and the Pacific, the toll to be twenty cents a ton. Chili would have to give its consent, and has been applied to.

Education.—There are 3,000 schools and educational establishments in the republic, attended by 230,000 pupils.

Immigration.—The number of immigrants landed in 1887 was 120,842, in 574 steamers, as compared with 93,116 in 1886. During the first six months of 1888 there arrived 63,503 immigrants. During the six years, from 1882 to 1887, both inclusive, 515,220 immigrants landed.

During the summer of 1888 the Government

sent to Europe the General Commissioner of Immigration, Don Samuel Navarro, to make arrangements for advancing passage-money to desirable individuals from the north of Europe wishing to emigrate to the republic, under provisions of the law of November, 1887, to be repaid in three equal yearly installments; the first, one year after arrival.

Colonization.—A colonization society has been formed in Brussels, Belgium, for the settlement and exploitation of 40,000 hectares of land granted by the Argentine Government for the purpose to Florimond van Varenbergh, the capital being fixed at 2,500,000 francs, and the charter of the company extending over twenty years. The site is on the Atlantic, on the peninsula of Valdez, and the colony is to be called "New Flanders." The *concessionnaire* has bound himself to introduce there 125 Belgian families of farmers. Another colonization company was formed at Corrientes, "La Colonizadora de Corrientes," with a capital of \$1,000,000.

The Government has made the following land grants during seven consecutive years: In 1881, 40,000 hectares; in 1882, 20,000; in 1883, 120,000; in 1884, 40,000; in 1885, 182,000; in 1886, 907,000; and in 1887, 4,369,000, together, 5,678,000 hectares. During the first four months of 1888 the total land sales amounted to 2,752,818 hectares, sold for \$23,851,495.

Exploring Expeditions.—The Geographical Institute of Buenos Ayres, under Government aid, has undertaken to explore southern Patagonia. Don Augustin del Castillo, captain of a frigate, who explored that part of the country before, was to command the expedition, which sailed for the Gallegos islands, and was to penetrate, if possible, beyond Lago Argentino to Lagos Viedna and San Martin, returning by the Rio Negro; also to determine the precise boundaries between the republic and Chili.

Another expedition, having for its object the exploration of the eastern slopes of the Cordillera from Mendoza to the Rio Negro, left on Dec. 1, 1888, undertaken by Dr. Frederick Kurtz, Professor of Botany at the University of Córdoba, and Dr. William Bodenbender, of the Palaeontological Museum of that city. The expense is defrayed by the Geographical Institute of Buenos Ayres, and by the National Academy of Sciences at Córdoba jointly.

Permanent Exhibition.—The President has issued a decree creating a permanent exhibition of Argentine products at Buenos Ayres.

Cattle.—The slaughtering at the *saladeros* for exportation of salted hides in the valley of the Rio de la Plata were as follows:

PLACES.	1887.	1886.	1885.
Buenos Ayres	61,000	182,000	246,500
Montevideo	180,000	314,000	256,500
On the rivers	581,000	744,000	755,000
Rio Grande	420,000	841,000	885,000
Total	1,242,000	1,581,000	1,648,000

The slaughtering operations for the season of 1888 were 763,900 head of cattle in the Argentine Republic, and on the banks of rivers, 452,250 in Uruguay, and 396,000 in Rio Grande, constituting a total of 1,622,150 head.

Harbor Improvements.—The Argentine Congress approved Engineer Manero's plans, and voted \$10,000,000 for the construction of a new port, the work on which is begun, and will consist first, of a canal 328 feet wide and 21 feet deep below low-water level, prolonging the Balizas river for the entrance of large ships; a basin of the same depth will be constructed for vessels remaining but a short time, and four other docks or basins also of the same depth, whose wharves will have a total length of 26½ feet; finally, a maritime basin of equal depth, and 4,692 feet long will be made. All the masonry will be of asphaltum blocks and brick. Separate storehouses will be built for imported goods and goods to be exported, which will occupy a total area of 3,280 feet by 164 feet, and have a capacity of 10,963,900 cubic feet. All the wharves will be provided with loading and unloading appliances.

Waterworks.—On June 23, 1888, the Government accepted the propositions of Messrs. Samuel B. Hale & Co., to complete the waterworks of the city, which will involve an outlay of \$21,000,000. The toll per house per month is to be \$6.

Viticulture.—The area under culture with vines in 1887, was about 2,700 hectares of 2½ acres; and the wine-production amounted to about 6,000,000 gallons, worth \$1,500,000. The vine-growing is chiefly in the province of San Juan, which produces grapes enough to make 250,000 hectolitres of wine. One wine-making establishment—that of Marengo and Ceresoto—exports 25,000 hectolitres annually, its cellars, factories, etc., covering a space of 80,000 square yards, and occupying, during vintage-time, between 850 and 500 operatives. There are several similar concerns in the province, which exports 80,000 hectolitres per annum. The vines cultivated are Monas, Molat, and Uva de Viña; Bordeaux vines have also been procured from Chili, the wine therefrom resembling Burgundy more than Bordeaux.

Quarantine.—In August, 1888, the governments of the Argentine Republic, Uruguay, and Brazil concluded a convention regulating uniformly among them the rules that henceforth are to be observed respecting quarantine as between them and as regards other nations, together with the sanitary inspection service.

The Falkland Islands.—The Argentine Republic has renewed its claim to the Falkland Islands, now held by Great Britain. These islands are in the South Atlantic Ocean, between 51° and 53° south latitude, and between 57° and 62° west longitude. They consist of the East Falkland, area 3,000 square miles; the West Falkland, 2,300 square miles; and about one hundred small islands with an area of nearly

1,200 square miles. Mount Adam, the highest ground in the colony, rises 2,315 feet above the sea. The Falkland Islands were discovered by Davis in 1592, and visited by Hawkins in 1594. In 1763 they were taken possession of by France; subsequently they were held by the Spaniards until 1771, when they were for a time abandoned, and the sovereignty of them was given up to Great Britain. In 1883 they were taken possession of by the British Government for the protection of the whale-fishery. In 1884 the population was 1,640. The revenue in 1885 was £10,438, and the expenditure £7,598; the imports in the same year amounted to £48,314, and the exports to £97,846.

ARIZONA. Territorial Government.—The following were the Territorial officers during the year: Governor, C. Meyer Zulick; Secretary, James A. Bayard; Treasurer, C. B. Foster; Auditor, John J. Hawkins; Attorney-General, Briggs Goodrich, who died in June, and was succeeded by John A. Rush, by appointment of the Governor; Superintendent of Public Instruction, Charles M. Strauss; Commissioner of Immigration, Cameron H. King, succeeded by Thomas E. Farrish; Chief-Justice of the Supreme Court, James H. Wright; Associate Justices, William W. Porter and William H. Barnes.

Finances.—The debt of the Territory is now somewhat over \$600,000. Of this sum, \$350,000 had been funded into bonds by the Legislatures previous to 1887, and the Legislature of that year provided for the funding of \$200,000 additional by the issue of bonds to that amount. These bonds were sold at par in the following November to the Bank of Arizona. The same Legislature raised the interest on Territorial warrants from eight to ten per cent., and increased the poll-tax from \$2.00 to \$2.50. The assessed valuation of the Territory in 1887 was \$26,313,500. For 1888 there has been a gain of \$1,000,000 in Maricopa County, and \$500,000 in Yavapai County alone.

Education.—The school system is not yet effective in drawing a proper proportion of the youth of the Territory into the public schools. The average daily attendance during the scholastic year ending in 1885 was but 3,226, although there were 10,219 children of school age in the Territory. That is, only 31 children out of every 100 attended school during that year, although the total expenditures for public schools amounted to \$188,164.83. For the year ending in 1886 the showing is but little better, as the Territory disbursed \$185,080 with the result of securing an average attendance of 35 out of each 100 children. The reports for 1887-'88 indicate improvement, but there is still an evident need of a compulsory school law.

Land Claims. On this subject, the Governor says, in his annual report: "Surveyor-General Hise, in his recent report to the Land Department, says there are Spanish and Mexican pri-

vate land claims pending in his office covering 5,195,348 acres. The early settlement of these grants is in every way desirable, in order that such claims, if any there be, as are just may be confirmed, and such as are fraudulent may be rejected, and the honest settler who in good faith located upon and paid the Government for his land may peacefully enjoy the same. The proposition before Congress to transfer these claims to a special court created for this purpose, if passed, or any transfer of the settlement of these claims from the Interior Department and Congress to the judicial arm of the Government, can not fail to work incalculable hardship to our settlers, and consequent damage to the Territory."

Irrigation.—It is claimed that in the past few years over \$2,500,000 have been expended in Arizona in the construction of irrigating canals, and that in the next year at least \$1,500,000 more will be expended. Great activity and enterprise is being shown throughout the entire southern portion of the Territory in locating water-rights, taking out canals, and reclaiming desert lands. The most extensive and successful irrigating canals are to be found in the Salt River valley, where canals over 200 miles in length and reclaiming about 225,000 acres are now in operation, and nearly 100 miles more are in process of construction. In Pinal County, along Gila river, canals designed to reclaim over 200,000 acres are being constructed. In the counties of Pima, Cochise, Graham, and Yuma, the reclamation of land is not so extensive, but beginnings have been made. On the Little Colorado and its tributaries, in the county of Apache, about 20,000 acres are under cultivation, while in the Verde valley, Yavapai County, about 2,500 acres have been restored.

Stock-Raising.—The following is the number of cattle and their assessed value for 1888, in the various counties, as returned to the Territorial auditor.

COUNTIES.	Number.	Value.
Apache	65,472	\$566,551 87
Cochise	78,294	783,940 00
Gila	19,974	201,196 00
Graham	45,541	455,410 00
Mohave	20,752	254,212 00
Pinal	81,460	814,814 00
Yavapai	141,174	1,684,988 00
Yuma	8,840	85,411 00
Maricopa	12,698	168,898 00
Total	413,715	\$5,582,515 87

To this total should be added Pima County, with 94,735 cattle, valued at \$1,012,290.

Mining.—The product of gold and silver for Arizona in 1887 is reported by Wells, Fargo, & Co. at \$5,771,555, a slight decrease from the previous year. In November, 1887, a vein of gold of exceptional richness was discovered by two miners in Yavapai County, on Hassayampa river, about twelve miles from Prescott. Over \$10,000 were taken from this mine in a few weeks, and an organization of

capitalists was soon made to develop the property, which is called the Howard mine.

Railroads.—For 1888 the total number of miles of railroad assessed in the Territory was 1,058.41, valued at \$7,817,980.57, a slight increase in the total assessment over the preceding year. No new lines have been constructed during the year. The Territory needs a greater number of north-and-south lines meeting the two great trunk lines passing through the Territory east and west. The following shows the details of the assessment for the year: Atlantic and Pacific, 898.41 miles, assessed at \$7,282.08 per mile; total valuation, \$2,862,186. Arizona Mineral Belt, 80 miles, at \$5,706.33 per mile; total, \$171,190. Arizona Narrow-Gauge, 10 miles, at \$5,200 per mile; total, \$52,000. Arizona and New Mexico, 41 miles, at \$4,502.22 per mile; total, \$184,591.13. Maricopa and Phoenix, 34.45 miles, at \$7,000 per mile; total, \$354,650. Prescott and Arizona Central, 78.3 miles, at \$5,151.62 per mile; total, \$377,613.75. Southern Pacific, 383 miles, at \$7,500 per mile; total, \$2,872,500.

Political.—The Democratic Territorial Convention met at Tucson on September 5, and renominated as delegate to Congress, Marcus A. Smith. Candidates for the Territorial Assembly were also nominated. The convention took an unusual position in refusing, by a vote of 80 to 34, to pass a resolution approving the national and the Territorial administration. Two weeks later the Republican Territorial Convention met at the same place, and nominated Thomas F. Wilson for Delegate, together with a ticket for the Legislature. Resolutions were adopted accepting the national platform, condemning the Democratic administration in the nation and Territory, and embracing also the following:

We condemn the pernicious practice of the present Administration in appointing men who are not only non-residents, but who are total strangers to the great natural, mineral, agricultural, and other resources of the Territories, as well as the important function and duties of the high offices whereof they are incumbent; and in this connection we respectfully invite attention to the custom at the present observed (we believe heretofore unheard of in America) of creating a horde of spies, ferrets, and blackmailing emissaries called "special agents," who, under cover of law and the pay and support of the Government, make it their business to obstruct and retard the honest settler and miner from developing our great resources and filling this Territory with thrifty and happy homes. This system now in vogue in Arizona is equalled in iniquity, if at all, only by the British plan of espionage in Ireland.

We demand the removal of the Apache Indians from the Territory.

It is the duty of Congress to appropriate sufficient money to construct reservoirs for water-storage in this Territory and for the development of artesian water, the benefits of which would enhance all values and bring to the treasury fourfold return.

At the November election the Democratic ticket was successful by about the usual majority, and a majority of the Democratic candidates for the Legislature were elected.

ARKANSAS. State Government.—The following were the State officers during the year: Governor, Simon P. Hughes, Democrat; Secretary of State, Elias B. Moore; Treasurer, William E. Woodruff; Auditor, William R. Miller; Attorney-General, Daniel W. Jones; State Land Commissioner, Paul M. Cobbs; Superintendent of Public Instruction, Wood E. Thompson; Chief-Justice of the Supreme Court, Sterling R. Cockrill; Associate Justices, William W. Smith and Burrill B. Battle.

Mining Excitement.—The State Geologist, in a letter to the Governor, in August, says:

There has long been a popular belief that gold and silver existed in paying quantities in the State of Arkansas. During the last few years, notably since 1885, a great many people have become excited upon the subject of the occurrence of the precious metals about Hot Springs, and through the country west of there. This excitement culminated in 1887-'88. In some portions of the State it reached such a pitch that almost every man abandoned his usual occupation to stake off claims and turn miner. Every unfamiliar rock was regarded as a valuable ore or an "indication" of something, and these delusions have been kept alive by assayers, some of whom were, perhaps, sincere, but some of them certainly fraudulent. These same assayers and their dupes have been so successful that they induced capitalists and business men, both in and out of the State, and especially the visitors to the Hot Springs, to believe in the value of the region for mining purposes to such an extent that during the last two and a half years companies have been incorporated under the laws of Arkansas with a total capital stock of more than \$111,000,000 for the purpose of working the supposed gold and silver mines and ores of the State.

After a careful assay of ores from all the so-called mines, the geologist fails to find more than two silver deposits that could by any possibility be successfully worked. Of the alleged gold-mines he says: "It is very doubtful whether a single one of them has ever legitimately returned a single ounce of gold. . . . The future of Arkansas, as a mining State, must depend upon her coal, iron, manganese, antimony, and possibly zinc, lead, and graphite. In these, and in oil-stone, marble, chalk, marl, and building-stone she is rich. The geology of the State is not favorable for the production or mining of the precious metals."

Immigration.—The natural resources of Arkansas have long failed of development, from lack of population, but the necessity of attracting immigrants to the State has not until recently been recognized. Early this year, a call was issued by the Governor for a State Convention to consider means of attracting settlers. This convention met at Little Rock, on January 31, and provided for a bureau of immigration, to be maintained by subscriptions secured by a canvass of each county. It also recommended to the next General Assembly the establishment of a State board of immigration. The necessity of such a board was afterward discussed and urged by the various political parties, in convention and during the political canvass.

Convicts.—The evils of the convict lease system received a fresh illustration during the

year in the treatment of prisoners at Coal Hill Camp, in Johnson County, where a large number of convicts were employed in the coal-mines. An inspection made in March by the State Penitentiary Commissioners revealed the fact that the convicts had been worked beyond the prescribed number of hours, had not been sufficiently fed or clothed or lodged, had been worked when physically unable, and had been in charge of brutal keepers, whose punishments had caused death to some and severe torture to many others. The convicts at this camp were ordered back by the Governor to the State Penitentiary, the warden of which was summarily removed for negligence or criminal conduct in permitting such abuses. The immediate overseer of the camp escaped punishment by fleeing the State.

Political.—The first political convention of the year met at Little Rock on April 30, being held under the auspices of the Union Labor party. This convention nominated the following ticket: Governor, C. M. Norwood; Secretary of State, G. W. Terry; Auditor, A. W. Bird; Attorney-General, W. J. Duval; Chief-Justice of the Supreme Court, O. D. Scott; Superintendent of Public Instruction, B. P. Baker; State Land Commissioner, R. H. Morehead. No nomination was made for the office of State Treasurer. Resolutions were adopted as follow:

We favor such legislation as will secure the reforms demanded by the Agricultural Wheel, the National Farmers' Alliance, and the Knights of Labor.

We pledge ourselves to do our utmost to enforce:

1. Taxation of all lands held for speculative purposes at their full value.
2. A strict execution of the election laws and such legislation as will secure a free ballot and a fair count.
3. The consolidation of the elections, State and national.
4. A change in the convict system, the abolition of the contract system, and the working of the convicts within the walls of the Penitentiary at Little Rock.
5. A road-tax and a reduction of days for road-working.
6. A public-school system that will educate all the people, and we favor national aid to education.
7. A law regulating mining and proper ventilation for same.
8. Laws subjecting trusts, railroads, and other corporations to State control.

"We favor the establishment of a labor and agricultural bureau."

This ticket relied for its support primarily upon the labor organizations, especially those of the farmers, of which the Agricultural Wheel is the most considerable in the State. It was greatly strengthened, however, by the decision of the Republicans to support it. A convention of Republicans, held in May, elected delegates to the National Republican Convention, but intrusted the selection of a State ticket to the State Executive Committee, which announced the adoption of the Union Labor ticket early in July.

The Democratic State Convention met at Little Rock on May 31. For more than two

months previous, aspirants for the gubernatorial nomination had been engaged in a thorough canvass of the State, two or more of them generally appearing upon the same platform in joint debate. The principal objection to Gov. Hughes, who was a candidate for re-nomination, rested upon the fact that a third term in that office would be contrary to precedent and would establish an undesirable practice. It was also claimed that the abuses existing in the penal institutions of the State were due in some measure to the Governor's neglect to examine their management properly. The other candidates before the people were John G. Fletcher, J. P. Eagle, W. M. Fishback, and E. W. Rector. The first ballot in the convention showed that no one had obtained a majority of the delegates, although the temper of the convention was evidently opposed to a third term. Gov. Hughes received 122 votes; Fletcher, 118; Eagle, 97; Fishback, 96; Rector, 25. A session of four days and 126 ballots were required before a choice was made. The nominee, J. P. Eagle, received on the final ballot 248 votes, against 201 votes for Gov. Hughes. Other nominees of the convention were as follow: Secretary of State, B. B. Ohism; Auditor, W. S. Dunlop; Treasurer, William E. Woodruff; Chief-Justice of the Supreme Court, Sterling R. Cockrill; Attorney-General, William E. Atkinson; Superintendent of Public Instruction, Wood E. Thompson; State Land Commissioner, Paul M. Cobbs.

The platform approves the national Administration, the tariff message of the President, and the Mills Bill, reiterates the doctrine of State rights, and continues as follows:

We favor liberal appropriations by Congress for the improvement of our waterways, to the end that commerce may be facilitated and rates of transportation regulated and cheapened, by bringing them into competition with those artificial avenues of traffic whose natural tendency is toward monopoly and extortion.

We point with pride to the successful administration of State affairs by the Democratic party and the results that prove its wisdom and patriotism—to wit: The rate of taxation reduced from seven to five mills, the marvelous increase of material wealth of the State, which was greatly enhanced by the passage of laws which subjected the property of wealthy corporations to the payment of an equitable proportion of the cost of their own protection, on a basis of fairness to themselves and justice to the people; the liberal encouragement and fostering care extended to the cause of public education; the founding and sustaining on a basis of broad liberality the various charitable institutions of the State; and the payment of so much of the just debt of the State as has already been accomplished, with the promise of its entire satisfaction at no distant day.

We indorse the action of the Legislature of 1887 in providing for a geological survey of the State, and favor the establishment by the next Legislature of a bureau of agriculture, manufacture, mining, and immigration.

We favor a system of liberal enactment for the encouragement of railroads and manufacturing establishments, but are opposed to any exemption in their favor from the burdens of taxation, which can not be extended alike to all tax-payers and citizens.

We indorse the united efforts of liberal-minded citizens of the State, regardless of political affiliations, to organize and build up a State bureau of immigration, and hereby second their invitation, extended to all earnest, honest, and intelligent people everywhere, regardless of political opinion or religious belief, to make their homes in Arkansas, where a cordial welcome from the people will be extended to them, and a variety of undeveloped resources, unexcelled by any equal area on the globe, promises a generous reward for industrious labor.

The financial embarrassment of the State having been safely and certainly relieved, we favor such modifications of the convict system of the State as can be effected, to the end that the State shall assume the complete control and responsibility for their maintenance; that their labor may not be brought into open and direct competition with the honest and voluntary labor of the people, and on such a reformatory basis that novices in crime may not be subjected to the beneficial influences of contact and association with hardened criminals.

We congratulate the people upon the growth of personal temperance throughout the State, and are in favor of the strict enforcement of the laws now in our statutes restricting the illicit sale of intoxicating liquors, believing that it affords a striking example of the beneficent effects of the principle of local self-government.

On July 4 the Prohibitionists of the State met and adopted the following resolutions:

We congratulate the friends of prohibition in Arkansas on the good they have accomplished in the contest with the liquor traffic, as is evidenced by the fact that at least one half of the State to-day stands redeemed from the presence of the saloon, and nearly one half of our voters have been educated up to the point where they will, under our local-option laws, vote against license.

That the friends of prohibition feel thankful to the past Legislatures for the passage of our local-option law, by and through which so much good has been done to our people and damage to the whisky traffic; and they would suggest that if said laws were amended in some particulars they would be more efficient, and we would request said amendments be made by the next Legislature.

That notwithstanding we are now in full accord with the national Prohibition party, and will put electors in the field, yet we will not nominate candidates for the various State offices, but will do all we can to advance the cause of temperance on the one hand and break down the liquor traffic on the other, by local option and such other means as we may be able in a lawful way to command.

At the election on September 8, owing in part to Democratic dissensions growing out of the heated contest for the nomination, the Democratic majority was more than 2,000 fewer than in 1886. Eagle received 99,214 votes, and Norwood 84,233; a Democratic majority of 14,981. These figures do not include the votes of nine townships of Pulaski County, the poll-books for which were stolen from the County Clerk's office after the election. The Legislature chosen was overwhelmingly Democratic, the minority consisting in part of Republicans and in part of Union Labor representatives. At the same election the question of calling a convention to frame a new Constitution was voted upon. Returns from all but three counties gave 41,818 votes in favor of the convention, and 90,780 against it. The November election resulted in favor of the Democratic national ticket.

ARNOLD, MATTHEW, English critic, born in Laleham, near Staines, England, Dec. 24, 1822; died in Liverpool, England, April 15, 1888. He was the eldest son of Dr. Thomas Arnold, author of a "A History of Rome," who became master of Rugby School in 1827, and there introduced new methods of discipline and instruction that created an epoch in the educational history of England. The son, after spending some years in a private school, was sent to Winchester College for a year in order to become familiar with the traditional system of English public schools. He then entered Rugby in 1837, and in 1841 came out near the head of the school, having in 1840 won a scholarship at Balliol College, Oxford. His audacious wit and brilliant conversation won the admiration of his fellow-students. Under the

his initial "A.," a volume called "The Strayed Reveler, and other Poems," which shows his inherited love of Greek sentiment and form, and his early devotion to Wordsworth. These poems include "The Forsaken Merman," the exquisite pagan poem "Resignation," and "The Sick King of Bokhara," an admirable picture of Eastern life in Central Asia. Three years later, in 1851, after teaching at Rugby as assistant master for a short time, he married a daughter of Justice Weightman, and was appointed to the office of lay inspector of schools, with supervision over the schools of the British and Foreign School Society, representing the Non-conformists. The laborious duties of a school inspector were the regular occupation of his life, and only ceased two or three years before he died. Many of his reports are preserved in the annual Blue Book issued by the Committee of the Council on Education. In these he urged, with the force of his epigrammatic and luminous style, the elevation of elementary education by such steps as existing conditions and the example of more progressive countries showed to be practicable. In 1859 he was sent to the Continent as foreign assistant commissioner to study the French, German, and Dutch systems of primary education. Eventually William E. Forster, who married Arnold's elder sister, framed a measure that established a much more rational, complete, and effective system of elementary instruction. In 1865 Mr. Arnold went on another official tour to examine into the state of secondary education abroad. His observations were embodied in "Schools and Universities on the Continent," which appeared in 1867. From that time he was possessed with the idea that the lack of organized middle-class education, such as exists in Germany and France, and the consequent ignorance of art, languages, and literature, and indifference to their refining influences, were the explanation of the dullness, vacuity, sordid instincts, blind prejudices, and moral obtuseness that characterize the middle classes of English society. He made it his task to hold up for reprobation the faults that he grouped under the name of "Philistinism," and to prove that it can be remedied by wider and better education. Five years after the publication of his first volume of poems, which were remarkable for classic finish, and therefore unattractive to the general public, he issued a second under the title of "Empedocles on Etna, and other Poems," but, soon becoming dissatisfied with the leading poem, he suppressed almost the whole edition. In 1854 he published under his name a volume containing some poems that were new and some that had appeared in the former collections, and this was followed soon afterward by another volume. These established his reputation among scholars, and in 1857 he was called to the chair of Poetry at Oxford. In 1858 appeared a tragedy after Greek models, named "Merope," which of itself was not so well received as was the remarkable essay on the principles of criticism

MATTHEW ARNOLD.

despotic but practical mastership of Dr. Jenkins, Balliol had become the hardest working college at Oxford; but, says Andrew Lang, "the Oxford of Mr. Arnold's undergraduate years was very much what Oxford had always been, a place for boating, cricket, and lounging." In his poem entitled "The Gipsy Scholar," he has embalmed the memories of those pleasant days. While he was at Balliol, Oxford was stirred with theological discussion. John Henry Newman was in the fullness of his popularity, and Arnold's intimate friend, Arthur Hugh Clough "took these things too hardly for his happiness." Mr. Arnold won a scholarship for proficiency in Latin the first year, and gained the Newdigate prize with an essay on "Oromwell" in the second, but obtained only a second class at graduation. In 1845 he was elected a fellow of Oriel College. His friendship with Arthur Hugh Clough of the same college is embalmed in the elegiac poem of "Thyrsis." Not desiring to take holy orders or to follow the life of a college tutor, he became private secretary of Lord Lansdowne, a leader of the Whigs, in 1847. In 1848 he published under

that formed the preface. His last appearance as a poet is in "New Poems" (1867); but this is a misnomer, for, like most of his volumes, it is full of reprinted pieces. "Empedocles" is restored in its entirety, but the most remarkable additions are "Thyrsis," "The Terrace at Berne," "Dover Beach," the stanzas on Obermann, and those from the "Grande Chartreuse." In two small volumes entitled "Lectures on translating Homer" and "Last Words," he argued the adaptability of the hexameter to the English language. His "Essays in Criticism," which first appeared in 1865, have had a broadening and elevating effect on the writing of reviews and throughout the range of modern English literature. "Study of Celtic Literature" appeared in 1867. His lectures gave to the Oxford professorship of Poetry an importance that it never had attained before. He was re-elected at the end of five years, but was compelled by the statute to retire on the conclusion of his second term, and when subsequently solicited to become a candidate again, he invariably declined, recoiling from the contest that would arise from clerical opposition caused by his writings. Assuming that historical and philological criticism had unsettled much that formed the accepted body of Christian belief, and perceiving that Christianity was losing its hold on some classes of society, he gave his mind to the consideration of what is permanent, spiritual, and ennobling in religion, with the view of presenting a purified and rational form of faith that would command the acceptance of the callous and the skeptical. Ten or twelve years after he had broached the subject in a magazine, he published a volume containing his conclusions under the title of "Literature and Dogma." This was supplemented by a review of criticisms upon it, entitled "God and the Bible," and in 1877 by "Last Essays on Church and Religion." His "Complete Poems" were published in two volumes in 1876, and, with the addition of more recent verses, in three volumes in 1885. Among his books not already mentioned are "Culture and Anarchy" (1869); "St. Paul and Protestantism," with an essay on "Puritanism and the Church of England" (1870); "Friendship's Garland," a witty and amusing satire (1871); "Higher Schools and Universities in Germany" (1875); "Isaiah, XL, L, XVI, with the Shorter Prophecies allied to it, edited with Notes" (1875); a selected edition of Johnson's "Lives of the Poets" with Macaulay's "Life of Samuel Johnson" (1878); and "Mixed Essays" (1879). He was an industrious writer for current literature, and few first-rate English magazines failed to number him among their contributors. His visits to the United States were made in 1883 and in 1886, during both of which tours he lectured in most of the larger cities. His last collected essays were "American Lectures" (1887); and his last paper was "Civilization in the United States," a widely read and much quoted article, in which he severely criticises

American habits, manners, literature, morals, and general want of interest to the traveler. "The man that introduced the useful adaptation 'Philistine,'" says Augustine Birrell, "could have little sympathy with Democracy."

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE. *American.*—The thirty-seventh annual meeting of the American Association for the Advancement of Science was held at Cleveland, Ohio. The Central High School building was devoted to the sessions. The meeting began on Aug. 15, and adjourned Aug. 22, 1888. The following were the officers of the meeting: President, John W. Powell, of Washington, D. C.; Vice-Presidents: Section A, Mathematics and Astronomy, Ormond Stone, of the University of Virginia, Va.; Section B, Physics, Albert A. Michelson, of Cleveland, Ohio; Section C, Chemistry, Charles E. Munroe, of Newport, R. I.; Section D, Mechanical Science and Engineering, Calvin M. Woodward, of St. Louis, Mo.; Section E, Geology and Geography, George H. Cook, of New Brunswick, N. J.; Section F, Biology, Charles V. Riley, of Washington, D. C.; Section H, Anthropology, Charles C. Abbott, of Trenton, N. J.; Section I, Economic Science and Statistics, Charles W. Smiley, of Washington, D. C. Secretaries: Section A, C. L. Doolittle, of Bethlehem, Pa.; Section B, Alex. Macfarlane, of Austin, Tex.; Section C, William L. Dudley, of Nashville, Tenn.; Section D, Arthur Beardsley, of Swarthmore, Pa.; Section E, John C. Branner, of Little Rock, Ark.; Section F, Bernhard E. Fernow, of Washington, D. C.; Section H, Frank Baker, of Washington, D. C.; Section I, Charles S. Hill, of Washington, D. C. Permanent Secretary, Frederick W. Putnam, of Cambridge, Mass.; General Secretary, Julius Pohlman, of Buffalo, N. Y.; Secretary of the Council, O. Leo Mees, of Columbus, Ohio; Treasurer, William Lilly, of Mauch Chunk, Pa.

Proceedings.—The meeting was called to order by the retiring president, Samuel P. Langley, who resigned the chair to John W. Powell, the president-elect. After the usual courtesies from the city and a brief address by the president, the meeting organized, and the sections took possession of the rooms assigned them. In the afternoon the several vice-presidents delivered their addresses before their respective sections, and in the evening the retiring president, Samuel P. Langley, gave his address.

Sections.—In the mathematical section about twenty-one papers were read touching on the problems of astronomy and theory of physical instruments as well as pure mathematics. Ormond Stone's address was "On the Motions of the Solar System." William Harkness gave an account of the instruments and processes employed by the United States Transit of Venus Commission to determine the solar parallax from photographs of the transit of Venus in Dec., 1882. Asaph Hall's paper "On the Supposed Canals on the Surface of the Planet Mars" was devoted to the so-called "Canals

of Mars," whose existence the paper tended to throw into discredit.

The physical section was well represented. The address by Albert A. Michelson was devoted to a consideration of the problems in relation to light-waves. A report on the teaching of physics was presented on behalf of a committee by Thomas O. Mendenhall. It took full cognizance of the increased knowledge of teachers and their consequent adaptability for more advanced work in the elementary schools. For the latter experimental work was recommended. For college courses three hours a week during the junior year was suggested as a minimum. The report elicited considerable discussion. W. Le Conte Stevens's paper on "The Qualities of Musical Sounds" was of much interest as asserting that difference of phase among the components of a sound affected its quality. Edward L. Nichols and W. S. Franklin described some experiments they had made to determine the velocity of the electric current. Although their method would have detected a current of one thousand million metres a second, it gave only negative results, tending to prove that the velocity sought was in excess of this amount. Edward P. Howland read a practical paper on instantaneous photography, treating of the necessary conditions for its success. He recommended as an illuminant a mixture of sulphur and magnesium. He gave an interesting lecture, with experiments, on the same subject.

The chemical section was largely occupied with a discussion of methods of water analysis. A committee handed in its report, stating the progress made, and was continued. "The Presence and Significance of Ammonia in Potable Waters" was admirably treated by E. S. H. Bailey. Albert W. Smith spoke on the subject of water and water-supply, with special reference to Cleveland; while the brines from the gas-wells near the same city were discussed by Charles F. Mabery and Herbert H. Dow. A paper of great interest was presented by William P. Mason, of the Rensselaer Polytechnic Institute, on "Fatal Poisoning by Carbon Monoxide." It described the fatal accidents due to an escape of fuel-gas at Troy, N. Y., on Jan. 6, 1887. Three deaths and a number of cases of serious illness resulted. The autopsies disclosed nothing abnormal except the vivid redness of the tissues and blood. The latter showed absorption bands due to the carbon monoxide, and a specimen was exhibited that still showed the characteristic color and absorption spectrum. In the discussion that this paper elicited, William S. Dudley spoke of cigarette-smoking, and traced its evil effects to the inhalation of the products of combustion containing carbon monoxide. The products from one and one fourth cigarette killed a mouse, and its death was found to be due to this gas and not to nicotine or any other alkaloid. The vice-president's address in this section, by Charles E. Munroe, presented the ad-

vanced views of chemistry, as developed by the labors of Mendelejeff and those who have followed in his steps in their endeavors to systematize chemistry. The title of the address was "Some Phases in the Progress of Chemistry." The committee on indexing chemical literature presented its sixth report.

The section of mechanical science and engineering was somewhat delayed in its work by the absence of its vice-president, Calvin M. Woodward, but Charles H. J. Woodbury, of Boston, Mass., was elected to fill his place. The Nicaragua and the Panama canals both were subjects of papers, the former being treated of by Robert E. Peary, the latter by Wolfred Nelson. "The Influence of Aluminium upon Cast-iron," as in the well-known "mitis castings," was the subject of a paper by William J. Keep, and a discussion by William J. Keep, Charles F. Mabery, and L. D. Vorce. The first-named read a paper detailing its beneficial effects upon stove-castings, and gave the foundation for the debate alluded to. The quality of the castings, it was shown, was in every way improved by the addition of small amounts of the metal in question. By repeated remeltings of a given sample, followed by a corresponding series of analyses, it was shown that the aluminium remained in the metal, and did not, practically speaking, disappear to any extent. Much of its influence on the final castings was due to the fact that it kept the carbon in the graphitic form, precluding the possibility of white iron.

In the geological and geographical section a number of interesting papers on geological subjects were read, but geography was omitted from the programme. A large number of speakers gave the results of their observations and studies. George H. Cook, the vice-president, in his address, spoke on the "International geological congress, and our part in it as American geologists." He gave briefly the history of the congress and its efforts to settle upon fixed systems of nomenclature, and colors for indicating different formations on geological maps. He made the plea that the American workers should be more actively represented, and that names less local, geographical, and strange, should be adopted for different formations. The labors of John S. Newberry, as usual, were represented by several papers, one on the oil-fields of Colorado, and others on palæontological subjects. Sources of oil and gas recently discovered in Ohio, Kentucky, and Indiana, were described by Edward Orton. A new form of geological map was exhibited by J. T. B. Ives. It consists of a series of colored pasteboards, each of which represents a geological system, the most recent rocks forming the highest layer. Where rocks of a given system do not exist they are cut out of the pasteboard representing them. Then by placing these different layers one upon the other a geological map is produced, valuable for purposes of instruction.

The proceedings of the biological section were, perhaps, as a whole, of less interest than usual. Charles V. Riley, the vice-president of the section, in his address, spoke on the causes of variation in organic forms, giving some of the most advanced points yet touched on by the evolutionary philosophy. A number of papers were strictly monographs of primarily technical interest. Edward P. Howland touched the more practical aspect of the subject in his paper on *anæsthesia*. He described remarkable results in prolonged insensibility produced by a mixture of nitrous oxide and oxygen administered in compression chambers. There seemed to be hardly any limit, comparatively, to the time a patient could be kept safely in the *anæsthetic* condition by the system he described.

The section of anthropology was crowded with interesting matter. This section is a strong feature of the meetings, and is said to have shown a distinct advance this year. Daniel G. Brinton, in his paper entitled "On the Alleged Mongolian Affinities of the American Race," strongly argued against the tenet held by so many that the Chinese and the American aborigines are of common stock. He stated that in true racial characteristics they widely differ, and that the obliquity of the eyes is rather an accidental than a family feature. Horatio Hale read two papers—one upon "The Aryan Race, its Origin and Character," devoted to proving the Asiatic origin of the Aryan family; the other, "An International Language." The second attracted much attention. He strongly upheld the importance of discussing the requisites of such a language, and devoted much time to showing the insufficiency of Volapük. As a sequence to this paper, a resolution was passed by the council, authorizing the appointment of a committee to attend any congress meeting for the consideration of an international language. The committee consisted of Messrs. Hale, Henshaw, and McFarland. Other features of this section's work were Frederick W. Putnam's illustrated paper on the "Serpent Mound," and the work done there during the last year in connection with its preservation and the explorations about it; Otis T. Mason's lecture on "Woman's Share in Primitive Industry," which was also illustrated by lantern projections; and Garrick Mallory's report on "Algonkin Pictographs." Charles O. Abbott's address was a summary of the evidence of the antiquity of man in eastern North America, showing that pre-glacial man is no longer a question but an established fact.

The committee appointed to memorialize the United States Congress on the subject of the preservation of archæologic remains upon public domain handed in its report, naming numerous remains of the early inhabitants of the continent which should be kept from destruction.

The section of economic science and statistics was favored with unusually interesting papers. Charles W. Smiley's address was of re-

markable interest. It was entitled "Altruism considered Economically." The necessity for governmental supervision over the forests of this country was the subject of a paper by Bernhard E. Fernow. He placed the value of the forests annually destroyed at from ten to twenty million dollars. Industrial training was brought before the section by Mrs. Laura O. Talbot, and her paper elicited a good discussion on the subject. Edward Atkinson's paper on "The Uses and Abuses of Statistics," showed how inexperienced persons may be misled in attempting to draw conclusions from statistics. He maintained that a strictly metallic currency was needed for the world, eliciting a strong remonstrance from Edward Daniels. The latter subsequently read a paper on "Our Monetary System," presenting views in favor of a paper currency. A carefully prepared and elaborate paper on this subject was by Edward H. Ammidown, upon "Suggestions for Legislation on the Currency." Wilbur O. Atwater, treating of the "Food-supply of the Future," predicted an increased production based on the discoveries of science. The decay of American ship-building was considered by Charles S. Hill. He demanded governmental fostering of shipping and ship-building. The Nicaragua Canal was also the subject of a report by Henry C. Taylor and of a paper by Lieut. Robert E. Peary.

Address of Retiring President.—The retiring president, Prof. Samuel P. Langley, devoted his address to "The History of a Scientific Doctrine." It treated of the subject of radiant energy, and eloquently depicted the struggles of past generations of scientific workers performed in quest of the laws and causes of light and heat. He showed how persistently the old caloric or substantial theory of light had overshadowed physical science, and how recently it had been disposed of. He stated that Science was not infallible, "that her truths are put forward by her as provisional only, and that her most faithful children are welcome to disprove them." He indicated one great problem waiting solution—the relation between temperature and radiation.

Several public lectures were given, among which was one by the president, John W. Powell, on "Competition as a Factor in Human Progress." He drew an important distinction between the actual laws of human progress and the doctrine of the survival of the fittest. Evolution, he declared, was barred from human progress—in its march the fittest did not always survive—the mind was advancing in some senses at the expense of the body. The struggle for existence is transferred from man to the works of his own hand. The beneficence of the process together with the speaker's own confidence in the love and charity of his fellow-men were well depicted. Thomas O. Mendenhall lectured on "Japanese Magic Mirrors." These lectures were complimentary to the citizens of Cincinnati.

Attendance.—The attendance of members at the meeting as registered was 842. One hundred and ninety-four papers were read in the several sections. The usual receptions were tendered by citizens. The members visited various localities of interest, and had an enjoyable excursion on the lake.

Appropriations.—The income of the research fund for the past year was granted to Frederick W. Putnam for the furtherance of his archaeological explorations in relation to the Serpent Mound in Ohio.

Meeting of 1889.—The next meeting is to be held at Toronto, Can., under the following officers: President, Thomas C. Mendenhall, of Terre Haute, Ind.; Vice-Presidents: Mathematics and Astronomy, Robert S. Woodward, of Washington, D. C.; Physics, Henry S. Carhart, of Ann Arbor, Mich.; Chemistry, William L. Dudley, of Nashville, Tenn.; Mechanical Science and Engineering, Arthur Beardsley, of Swarthmore, Pa.; Geology and Geography, Charles A. White, of Washington, D. C.; Biology, George L. Goodale, of Cambridge, Mass.; Anthropology, Garrick Mallery, of Washington, D. C.; Economic Science and Statistics, Charles S. Hill, of Washington, D. C. Permanent Secretary, Frederick W. Putnam, of Cambridge, Mass.; General Secretary, O. Leo Mees, of Terre Haute, Ind.; Secretary of Council, Frank Baker, of Washington, D. C. Secretaries of sections: Mathematics and Astronomy, George O. Comstock, of Madison, Wis.; Physics, Edward L. Nichols, of Ithaca, N. Y.; Chemistry, Edward Hart, of Easton, Pa.; Mechanical Science and Engineering, James E. Denton, of Hoboken, N. J.; Geology and Geography, John C. Branner, of Little Rock, Ark.; Biology, Amos W. Butler, of Brookville, Ind.; Anthropology, William M. Beauchamp, of Baldwinsville, N. Y.; Economic Science and Statistics, John R. Dodge, of Washington, D. C.; Treasurer, William Lilly, of Mauch Chunk, Pa.

British.—The British Association for the Advancement of Science held its fifty-eighth annual meeting at Bath, beginning, Sept. 8, 1888. Twenty-four years have elapsed since this city was the scene of its labors. The list of presidents is as follows: President of the Association, Sir Frederick J. Bramwell; Section Presidents: Mathematics and Physics, Prof. George F. Fitzgerald; Chemistry, Prof. William A. Tilden; Geology, Prof. William Boyd Dawkins; Biology, Prof. William T. Thistleton Dyer; Geography, Sir Charles Wilson; Statistics, Lord Brannwell; Mechanics, William H. Preece; Anthropology, Gen. Pitt-Rivers. The city of Bath possessing no public hall, a temporary building was erected at a cost of £700 to provide a reception-room and offices.

General Meeting.—The first general meeting was held on Wednesday, September 6, at 8 p. m. Sir Henry E. Roscoe, the retiring president, resigned his chair to the president-elect, Sir Frederick J. Bramwell. Prof. Roscoe intro-

duced his successor by a few happily chosen words, alluding to Sir Charles Lyell, president at the former Bath meeting of 1864, stating that pure science was honored in Prof. Lyell, while in the election of Sir Frederick J. Bramwell a tribute is paid to applied science.

President's Address.—The president's address began with a review of the work of old time engineers, who developed prime movers, and brought the story down to the present day. He spoke of the increased perfection of the modern steam-engine, but reminded his hearers of his own prophecy made at the York meeting, that the steam-engine would in the next century be a thing of the past. He then cited gas, naphtha, and caloric engines to prove that the direction of engineering progress had been correctly indicated by him. The effect of the "next to nothing" in engineering practice was then developed. He cited the effect of minute impurities upon metals, of the importance of the introduction of precisely the right amount of air into steam-boiler and other furnaces to secure economy of fuel, and of the effect of alloys upon metals even when in minute proportions. The influence of the "little" was well illustrated in gun-practice where the difference of density of the air above and below a projectile is supposed to cause its lateral deviation. He also cited the fact that a projectile fired due north, a distance of twelve miles in one minute, would deviate from the meridian 200 feet. The tenor of the latter portion of the address was the importance of minute accuracy in engineering practice.

Sections.—Mathematical and Physical Science.—Prof. Fitzgerald, elected as substitute for Prof. Schuster, began his address by a tribute of regret for the loss of Prof. Schuster as president, who was too ill to attend the meeting. His address was devoted to the exposition of J. Clerk Maxwell's theory that electro-magnetic phenomena are due to an intervening medium. "The year 1888," he affirms, "will ever be memorable as the year in which this great question has been experimentally decided by Hertz, in Germany, and I hope, by others in England." The intervening medium, he stated, has been decided to exist. Prof. Hertz produced rapidly alternating currents of such frequency that their wave-length was about two metres, giving 100,000,000 vibrations per second. With these he detected phases of interference corresponding with those of light-waves. Thus we seemed to be approaching a theory of the structure of the ether.

Chemical Science.—Prof. Tilden devoted himself to the subject of the teaching of chemistry. He advocated a better system, a higher grade of teachers, and less hours of labor for them, in order that they might have time to keep abreast of the age by reading. He said that it took longer than it did formerly to make a chemist, as more was expected of him; he had to be almost polytechnical in his education.

Geology.—Prof. Dawkins spoke of the ad-

vances in this science, more especially as regarding the filling up of former gaps in the sequence of animal and plant forms and types. He insisted that the Darwinian theory was receiving additional confirmation. Treating of the question of time in geology, he stated his belief that all attempts to express geologic time in terms of years were failures.

Biology.—Prof. Thistleton Dyer began by alluding to the loss biological science had sustained in the deaths of the great botanists Asa Gray and Anton De Bary. He then spoke of the outlook presented by the world for the development of systematic botany. London, he said, possessed the best facilities for the work. England, the United States, and Russia were the most active in the prosecution of the laborious task. He pleaded for more workers and for increased accuracy in nomenclature. After reviewing the work done in different portions of the globe, and describing the areas covered by different investigators, he spoke of the Darwinian theory. Prof. Weisman's theory of the continuity of the germ-plasm and the increased difficulty it might throw on the acceptance of the Darwinian hypothesis were spoken of, and the recent school of the new Lamarckism was described. The speaker's tendency was to adhere to Darwin, yet it is interesting to note how in the present day of discussions Darwin's own doubts are so clearly brought forward. This is very noticeable in Prof. Thistleton Dyer's address. Physiological botany, putrefaction, and bacterial inoculation for disease were finally treated in some detail. The address was long and very able.

Geography.—Col. Wilson reviewed the history of commerce and the various centers and paths which it had chosen in the past. The influence of the Suez Canal was considered, and the immense importance it had given to England in the world of commerce was explained. For the Panama Canal the speaker predicted far less important changes and results. African geography and the retardation of the development of the continent by its deadly climates were, in conclusion, touched upon.

Mechanical Science.—Mr. Preece, in his address, described the development of practical electricity. He spoke of Prof. Oliver Lodge's brilliant experiments in electrostatic discharge, and noted the discussion which was to take place upon the subject of lightning-conductors. The history of the telegraph and its most recent improvements and achievements were next in order. One hundred and ten thousand miles of cable have been laid by English ships, and £40,000,000 have been invested in the same by English capitalists. Thirty-seven ships are maintained to carry on repairs and lay new cables. In 1875 it was thought wonderful to transmit 80 words a minute to Ireland, while now 461 words a minute can be sent. The economic features of electric lighting and the history of its development, the

transmission of energy by electricity, and other practical applications were described. Finally, the distinction was drawn between the physicist's and engineer's conceptions of electricity, the first treating it as a form of matter, the latter as a form of energy.

Attendance, etc.—The attendance at the meeting was nearly 2,000. Public lectures, excursions to points of interest, and exhibitions by Col. Gourand and Mr. Henry Edmunds, of the phonograph and graphophone, were features of the occasion. The president for 1889 was announced as Prof. William Henry Flower.

Appropriations.—The grants for scientific research, divided among all the sections, aggregate £1,645.

ASTRONOMICAL PROGRESS AND DISCOVERY.

Instruments.—The Royal Observatory of Greenwich, England, has had constructed a new personal-equation machine, to be used with the transit-circle. An object-glass $7\frac{1}{4}$ inches in aperture, is fastened in front of the object-glass of the transit-circle telescope, when this telescope is made horizontal and pointed north. In the focus of the outer lens (51 feet away) is placed the vertical plate of the personal-equation machine. This plate can be made to show an artificial star or sun. The plate is moved by suitable apparatus at any desired speed, and the star's transit is observed over the wires in the transit circle. The true times of transit over the wires are registered automatically by means of contacts between two sets of platinum studs, properly constructed and adjusted. The special point aimed at in this instrument was to reproduce the same conditions as when the heavenly bodies were observed with the transit circle. The results obtained are said to be very satisfactory.

In the June, 1888, number of the "Monthly Notices of the Royal Astronomical Society," Sir Howard Grubb describes a new arrangement of electrical control for driving-clocks of equatorials. The apparatus was devised for the stellar photographic instrument of the Mexican (Chapultepec) Observatory. The novel part of the apparatus is the governor. In this particular governor he uses, instead of the ordinary balls, a brass ring loaded with lead and cut into eight segments: and in addition to gravity, springs are applied, one to each segment, tending to supplement the force of gravity. By this arrangement the speed of the governor may be increased from 90 to 135 revolutions. A number of ingenious devices are employed for controlling the motion, detecting the errors, and correcting them.

The new heliometer mounted at the Cape Observatory by Dr. Gill, employs electric illumination only for all the scales, circles, etc. Accumulators were first used, the charging being done by Grove batteries; but this was found to be so troublesome, dirty, and expensive, that they now employ a dynamo run by a steam-engine.

Herr E. V. Gothard, in the "Zeitschrift für

Instrumentenkunde," describes a simple apparatus, which he has devised for the purpose of registering the readings of the wedge photometer without disturbing the condition of the eye by bringing up a light to read the micrometer-head.

Herr Repsold has recently proposed a partially automatic method of recording transits. The transit is mounted so as to be virtually an equatorial, with a small motion only in hour-angle near the meridian. A star just before transit is brought into the center of the field of view, and the driving-clock started, so that the star remains steadily in the same part of the field, and its position in the field may be observed with the right-ascension micrometer. Meanwhile the telescope is following the star up to the meridian, and on reaching the meridian the clock-work is automatically disconnected and a record made on the chronograph sheet.

United States Naval Observatory.—Prof. William Harkness, of the executive committee of the Transit-of-Venus Commission, has given the preliminary results of the work of that commission, which are detailed elsewhere. The great equatorial has been used in observations on the fainter satellites and double stars. The transit-circle work has been continued, as in previous years, and comets and asteroids

known as the Henry Draper Memorial has been much extended. The second annual report of the director on this work, shows that two telescopes are kept at work at the observatory, photographing stellar spectra every clear night. Four assistants are required in making the pictures, and five are employed for measurements and reductions. The report gives the mode of testing the sensitive plates. Mrs. Draper has sent to the observatory the 15- and 28-inch reflectors constructed by Dr. Draper, which are used in the above-mentioned work. In continuation of the work of examining high altitudes for the purpose of testing their suitability for astronomical purposes, Prof. Todd, of Amherst, tested some high points in Japan, whither he had gone to observe the eclipse of August, 1887. His report is favorable.

In Parts 3, 4, and 5 of vol. xviii of the "Annals" are described Mr. Parkhurst's photometric measures of the asteroids, observations made during the total lunar eclipse of Jan. 28, 1888, the photographic search for a lunar satellite, and Mr. W. H. Pickering's observations of the total solar eclipse of Aug. 29, 1886.

Yale College Observatory.—Dr. Elkin's report for 1887-'88 has been published. Helium observations on the parallaxes of the ten first-magnitude stars are completed. His results are as follow :

STAR.	Parallax.	Probable error.	No. of comparison-stars.	No. of observations.	Proper motion.
α Tauri (Aldebaran).....	+ 0.116"	± 0.039"	6	64	0.909"
α Aurigæ (Capella).....	+ 0.107	.047	2	16	0.442
α Orionis (Rigel).....	- 0.009	.049	2	16	0.022
α Canis Minoris (Procyon).....	+ 0.266	.047	2	16	1.257
β (semionum) (Pollux).....	+ 0.063	.047	2	16	0.628
α Leonis (Regulus).....	+ 0.098	.048	4	15	0.255

α Lyræ (Vega).....	+ 0.034	.045	2	30	0.844
α Aquilæ (Altair).....	+ 0.199	.047	4	16	0.647
α Cygni (Arided).....	- 0.043	.047	4	16	0.010

and star occultations by the moon, and observations of stars for the Yarnall Catalogue have been kept up. Prof. Eastman began his zone work with the transit circle about October 1st.

Capt. R. L. Phythian has replaced Commander Brown as Superintendent of this observatory.

A circular "Relating to the Construction of a New Naval Observatory" has been issued by the Navy Department. The plans of the proposed observatory have been completed. It will be on Government property, at Georgetown Heights, Washington, D. C., and will comprise nine buildings. 1, the main building, 69 × 307 feet, which will contain the transit-room, library, etc.; 2, the great equatorial building, 46 × 72 feet; 3, the clock-room, 18 × 20 feet; 4 and 5, observers' rooms, each 18 × 20 feet; 6 and 7, east transit-circle building and west transit-circle building, each 30 × 40 feet; 8, prime vertical building, 18 × 20; 9, boiler-house, 45 × 54.

Harvard College Observatory.—Through the continued liberality of Mrs. Draper, the work

The value for α Canis Minoris (Procyon) above given agrees well with the mean of the values found by Auwers and Wagner. Struve found for α Aquilæ (Altair) a value of +0.181", and Hall's value for α Tauri (Aldebaran) was +0.102". O. Struve obtained very different parallaxes for Aldebaran and Capella, and the seven independent determinations of parallax of α Lyræ which have previously been made, agree fairly well in assigning to it a parallax of about +0.17". Dr. Elkin is now engaged on a triangulation of the regions near the pole, to get fundamental places of twenty-four stars; and in connection with Dr. Gill (at the Cape of Good Hope) he will this winter observe the opposition of Iris for the determination of solar parallax.

Lick Observatory.—The Lick Observatory was formally transferred by the trustees to the regents of the University of California on June 1, 1888. Of the \$750,000 left by Mr. Lick for the purpose of building the observatory and purchasing instruments, all has been expended except, it is said, about \$90,000. This is the

nucleus of a fund the interest of which is to pay for the care and use of the observatory and instruments. The University of California is making efforts to increase this maintenance fund to \$1,000,000. The observatory has recently issued the first volume of its publications. The contents of the volume are Mr. Lick's deeds of trust; Prof. Newcomb's report on glass for objectives; report of Mr. Burnham's work at Mount Hamilton in testing the climate for double-star work in 1879 and again in 1881; descriptions of the buildings and instruments; an account of the engineering and building at Mount Hamilton in 1880-'85; observations of the transits of Mercury in 1881, and of Venus in 1882; geological reports; meteorological observations, 1880-'85; reduction-tables for Lick Observatory.

instruments. (See "Annual Cyclopædia" for 1885, page 54.)

New American Observatories.—The Denver University Observatory, of Colorado, is to be provided with new observatory buildings and a new refracting telescope with 20-inch object-glass. The telescope is to be mounted 5,000 feet above sea-level, or 800 feet higher than the great Lick telescope. Mr. H. B. Chamberlain, of Denver, is the donor.

The Dearborn Observatory, of Chicago, is being removed to Evanston (within a few miles of Chicago). It will be placed on a site 250 feet from Lake Michigan. It is expected that the 18½-inch equatorial will be remounted in its new home in January, 1889.

Foreign Observatories.—The report of the Pulikowa Observatory for 1887 says that the 30-

LICK OBSERVATORY.

Mr. Keeler has recently shown that the seeing in winter is not especially better at the observatory than at lower elevations. At other times "the secret of the steady seeing at Mount Hamilton lies in the coast fogs. These roll in from the sea every afternoon in the summer, rising from 1,500 to 2,000 feet. They cover the hot valley, and keep the radiation from it shut in. There are no fogs in day-time, and few in winter."

The complete instrumental equipment of the observatory is as follows: equatorials of 36, 12, and 6½ inches aperture, a 4-inch comet-seeker, photoheliograph, 6-inch meridian circle, declinograph, 4-inch transit and zenith telescope combined, 2-inch universal instrument, three chronographs, five independent clocks, besides controlled clocks and chronometers, minor astronomical and a good set of meteorological

inch refractor was employed by Dr. Hermann Struve in measuring those of Burnham's double stars which are only seldom measurable with the old 15-inch, together with other stars of which measures are scarce, making a working catalogue of 750 stars. Observations were also made of the fainter satellites of Saturn, and of that of Neptune. Ludwig Struve has calculated the constant of precession and the motion of the solar system in space. He obtained values not greatly different from those previously calculated.

The Royal Observatory, Greenwich, is to have a new 28-inch refractor. The glass disks have been cast by Messrs. Chance, and the lenses will be made by Sir Howard Grubb.

At the Oxford Observatory Prof. Pritchard examined for the Photographic Committee of the Royal Society two silver-on-glass mirrors

of the same aperture, but of different focal lengths. He found that mirrors, particularly those of short focal length, are comparatively unsuitable for the photographic work of charting the heavens.

At the Paris Observatory M. Loewy's new method for determining aberration and refraction is being used. The brothers Henry have continued their magnificent work in celestial photography, having taken seventy-four plates of different parts of the sky in 1887. The report of the director, Admiral Mouchez, contains an engraving of the Pleiades made up from three of the Henry photographs.

Astronomical Photography.—Prof. Pritchard, of Oxford Observatory, was encouraged by his success in determining from photographic plates the parallaxes of the components of 61 Cygni, to discuss the parallaxes of μ Cassiopeia and the pole-star. His equatorial he improved, and on each of fifty-three nights four plates were taken of μ Cassiopeia. The exposures varied from five to ten minutes. About three per cent. of the plates were injured or unsuitable for measurement. He took two impressions on the same plate, slightly moved in position. Two comparison-stars were used. The resulting parallaxes were:

$$\begin{aligned} \text{From star (A)} \quad \pi &= 0.0601'' \pm 0.037'', \\ \text{“ “ (B)} \quad \pi &= 0.0211 \pm 0.0235. \end{aligned}$$

An investigation of the results obtained by using only a few selected plates of 61 Cygni and μ Cassiopeia has led Prof. Pritchard to give up the laborious method used in the case of 61 Cygni, and hereafter to limit the observations to five nights in each of the four periods of the year indicated by the position of the parallactic ellipse. He hopes in this way to determine in one year the parallaxes of fifteen stars. He plans to apply this method systematically to all stars between the magnitudes 1.5 to 2.5 which are well visible at Oxford. From a discussion of the approximate parallaxes that he expects to obtain, Prof. Pritchard hopes to infer some important cosmical relations. The result of his approximate determination of the parallax of Polaris is $\pi = 0.052''$. A mean of all the determinations of preceding observers is, according to Maxwell Hall, $\pi = 0.043''$. From six months' observations, Prof. Pritchard has obtained the following provisional parallaxes:

$$\begin{aligned} \alpha \text{ Cassiopeia, } 0.073'' &\pm 0.043'', \\ \beta \text{ Cassiopeia, } 0.157 &\pm 0.089, \\ \gamma \text{ Cassiopeia, } 0.050 &\pm 0.047. \end{aligned}$$

Isaac Roberts has taken photographs of the ring nebula in the Lyre (57 M. Lyrae), the dumb-bell nebula (27 M. Vulpeculae), and the fine, globular star-cluster (13 M. Hercules). In the first the ring was well shown, also the central star and nebulous matter in the interior, but there was no evidence of resolvability. The photographs seem to confirm the suspicion that the central star is variable. Photographs of the star-cluster showed prominent features not noticed by Sir J. Herschel and

the Earl of Ross. All these photographs were enlarged from three to twenty-five times. Mr. Roberts calls attention to the important fact that, owing to different causes, which are not easily discernible, but may be atmospheric, chemical, and mechanical, the same area in the heavens will show, on the same exposure with similar plates, with apparently the same clearness of sky, surprising differences in the number of stars. He finds, on comparing M.M. Henry's plate of the stars in Cygnus taken in 1885, with those taken by himself in 1886 and in 1887, that the number of stars in the Henry plate is 8,124; in his plate of 1886, 5,028; and in his plate of 1887, 16,206; the exposure in each case was sixty minutes. The brothers Henry have succeeded in taking a photograph of the Pleiades after an exposure of four hours, which shows very much more nebulous matter than their well-known photograph taken last year. The negative shows stars down to the seventeenth magnitude.

Photographic Chart of the Heavens.—Dr. Gill, at the Cape of Good Hope, is pushing this work in its preliminary stages with great energy. The photographic instrument is kept at work by two observers from evening twilight until dawn. The reduction of the plates from south polar distance 0° to 12.5° has been completed, and measurements are proceeding to south polar distance -30° . Derby dry plates were used with half-hour exposure, instead of an hour as previously. Dr. Gill, in a paper published by the International Committee for the Photographic Charting of the Heavens, proposes the establishment of a central bureau consisting of chief, assistants, secretaries, and a staff of measurers and computers to take the photographs and measure them and make a catalogue, the work to go on for twenty-five years, at a cost of \$50,000 per annum. This would require the cataloguing of 2,000,000 stars. Some astronomers object to this work as being unnecessary. It is expected that a considerable number of observatories in Europe and America will begin work on the photographic chart in 1889.

Solar Parallax.—Prof. William Harkness, in No. 182 of the "Astronomical Journal," gives an abstract of his paper, read before the A. A. A. S., "On the Value of the Solar Parallax deducible from American Photographs of the Last Transit of Venus." In this paper an account was given of the instruments and processes employed by the United States Transit of Venus Commission in determining the solar parallax from photographs of the transit of Venus which occurred in December, 1882. Let π be the solar parallax, and δA and δD , respectively, the corrections to the right ascensions and declinations of Venus given by Hill's tables of that planet. Then, on the assumption that Hansen's tables of the sun are correct, there resulted from measurements of the distances between the centers of the Sun and Venus, made upon 1,475 photographs,

taken respectively at Washington, D. C.; Cedar Keys, Fla.; San Antonio, Tex.; Cerro Roblero, N. M.; Wellington, South Africa; Santa Cruz, Patagonia; Santiago, Chili; Auckland, New Zealand; Princeton, N. J.; and the Lick Observatory, Cal.:

$$\begin{aligned}\pi &= 8.847'' \pm 0.012'' \\ \delta A &= + 2.898 \\ \delta D &= + 1.254\end{aligned}$$

and the corresponding mean distance from the earth to the sun is 92,385,000 miles, with a probable error of only 125,000 miles. These numbers are doubtless close approximations to the results that will be obtained from the complete discussion of all the photographs; but they can not be regarded as final, for several reasons, chief among which is the fact that the reduction of the position-angles of Venus relatively to the Sun's center is still unfinished. When these angles are combined with the distances, it is likely that the probable error of the parallax will be somewhat reduced. The photographs taken at Lick Observatory seem to indicate that for altitudes 4,000 feet above sea-level, the values of the refraction given by the tables in general use are somewhat too large. Prof. L. Orul's has published the results of the Brazilian observations of the transit of Venus made at three stations, St. Thomas (Antilles), Pernambuco, and Punta-Arenas. The final result for parallax is $\pi = 8.808''$. This curiously coincides exactly with the result of the English observations, taking the lowest probable result.

Eclipses of the Moon.—Two interesting total eclipses of the moon occurred in 1888. The first on January 28, and the second at midnight, July 22. The moon rose eclipsed on January 28, but was beautifully visible on July 22. Observers of the eclipse of January 28 report a remarkable contrast between the visibility of the eclipsed moon on that occasion and in October, 1884. The moon at the latter date was scarcely visible, while at the former it shone with a light that was plainly visible. Prof. Filopanti, of Bologna, thinks that the red color during the total eclipse arose in part from a phosphorescent quality of the exposed lunar surface. To astronomers these two eclipses of the moon were especially interesting as affording opportunity for the observation of the occultations of faint stars by the moon. Dr. Döllen, of the Pulkowa Observatory, Russia, prepared lists of stars to be occulted by the moon, and sent these to many observatories in Europe and the United States, with the request that the times of disappearance and reappearance be noted and forwarded to him. He reports that he has obtained in this way observations of 768 phenomena (396 disappearances and 387 reappearances), made at fifty-five different places. The places of observation are so favorably situated that he considers there is ample material for calculating the place, the diameter, and possibly the ellipticity and the parallax of the moon. For the parallax and

distance of the moon he has bases of 90° in latitude and 150° in longitude.

Asteroids.—The small planet Isteria (183) was rediscovered by Palisa, April 7, 1888. Of the first 250 of the planets, 288 have been observed at second opposition. Only two of the exceptions are between numbers 200 and 250. Since the article in the "Annual Cyclopædia" for 1887 was written, No. 268 has been named Adorea; 269 has not been named, and 270 has been styled Anahita. The opposition in longitude of Sappho (80) occurred April 12, 1888. Observations were made by many astronomers to determine the correction to the elements of the planet's orbit. In August and September, 1889, this planet will make a near approach to the earth, on account of the eccentricity of its orbit and the commensurability of its period with that of the earth. Observations of this planet will be taken in 1889 to determine the value of solar parallax. Prof. O. H. F. Peters gives the following results of some of his photometrical work on the small planets:

	Volume in millions of cubic kilometres.
Vesta, 6.5 magnitude.....	82.3
Ceres, 7.7 ".....	21.8
Pallas, 8.6 ".....	6.4
Hygeia.....	4.3
Eunomia.....	4.3
Juno.....	8.7
Hebe.....	2.4
Iris.....	2.4
Psyche.....	2.1
Lutetia.....	1.9

The total volume of the ten largest asteroids, therefore, is 81.5 millions of cubic kilometres; that of the first seventy, Prof. Peters found to be 127.74; and as the volume of the earth is 1,082,841 millions of cubic kilometres, the combined volumes of the first seventy asteroids is to that of the earth as 1 to 7,862.

Prof. Daniel Kirkwood has published recently an exceedingly interesting work of sixty pages on "The Asteroids or Minor Planets between Mars and Jupiter." This gives, among other items of interest, the asteroids in the order of discovery, to and including No. 271, the elements of the asteroids, theories in regard to the origin of asteroids, etc. The following asteroids have been discovered since the table in the "Annual Cyclopædia" for 1887 was prepared:

No.	Name.	Discoverer.	No. of discovery.	Date of discovery.
271.	Penthesilea	Dr. Knorre, at Berlin.	4	Oct. 13, 1887
272.	Antonia	M. Charlois, at Nice.	2	Feb. 4, 1888
273.	Atropos	Herr Palisa, at Vienna	61	March 8
274.	Philagoria	" " " "	62	April 3
275.	Sapientia	" " " "	63	April 15
276.	Adelheid	" " " "	64	April 17
277.	M. Charlois.....	8	May 8
278.	Paulina	Herr Palisa.....	65	May 16
279.	" " " "	66	Oct. 25
280.	" " " "	67	Oct. 31

Comets.—Six comets were discovered in 1888 up to November 1. Comet I was discovered early in the morning of February 19, by Mr. Sawerthal as he was returning from the

photographic observatory of the Royal Observatory at the Cape of Good Hope. He noticed with the naked eye a suspicious object, which, on investigation with the opera-glass, proved to be a comet. The observations of various observers show that the comet was well defined, the tail being distinctly visible to

It has been suggested that there were three tails. In May the appearance of the comet was said to be similar to that of Encke's comet (Dec. 2, 1871), as drawn by Prof. Hall. A sudden increase in brightness is reported to have occurred about May 28. The spectrum obtained was faint, but fairly broad, continu-

LICK OBSERVATORY.—PIER OF THE GREAT TELESCOPE.
Mr. Lick's tomb is in the base of the pier.

the naked eye, and estimated in April to be nearly 5° in length. The nucleus was seen elongated by many; others report a complete separation into two portions. The duplicity of the nucleus was confirmed by observations made by Barnard, at Lick Observatory. The separation of the two portions was estimated by C. B. Hill to be about equal to $8''$ of arc. Observers report the tail very bright along the central axis, and much fainter on either side.

ous, and crossed by three faint bands, corresponding to the well-known carbon-bands characteristic of cometary spectra in general.

Comet II is the twenty-fifth reappearance of the Encke comet, the period of which is 3.3 years. It was detected on the evening of July 8, by John Tebbutt, at Windsor, New South Wales. Its position had been predicted by Drs. Backlund and Seraphimoff, and it was found almost exactly in the place assigned.

In a 4½-inch telescope it appeared as a small, bright, nebulous star, without a nucleus. It was moving rapidly both east and south. This comet was originally discovered on Nov. 26, 1818, by the astronomer Pons, at Marseilles. It was then visible for seven weeks. Prof. Encke, of Berlin, subjected the observations to a careful investigation, and showed that the orbit was elliptical, with a period of about three and one third years. He identified the comet with the comets of 1786 I, 1795, and 1805, and predicted its return. His calculations were almost exactly fulfilled. Ordinarily it appears to have no tail. In 1848 it had two, one about 1° in length directed from the sun, and the other a little shorter, and turned toward it. At perihelion the comet passes within the orbit of Mercury, and at aphelion its distance from the sun is about equal to that of Jupiter. Investigations of the motions of this comet show that its period is steadily diminishing by about two and a half hours in every revolution. Encke's theory was that the comet, in moving through space, met with a resistance from some rare medium, which was not able to impede the greater masses of the planets. Many astronomers are inclined to doubt the existence of a resisting medium; but lately, Dr. Backlund, the Swedish astronomer, from an examination of the observations of the comet between 1871 and 1881, concludes that there is a retardation, although the amount is less than that assigned by Encke. No other comet seems to be retarded, so that if we accept the theory of a resisting medium we must imagine that it does not extend very far from the sun. The in-

1848. It had a bright nucleus and short tail, but was not visible to the naked eye. Leverrier investigated its orbit, and predicted its return to perihelion on April 3, 1851. It returned within a day of the time predicted. Its perihelion-distance is about 100,000,000 miles, and its aphelion distance about 500,000,000 miles.

Comet V was discovered on September 2, by E. E. Barnard, at the Lick Observatory. It was described as circular, 1' in diameter, eleventh magnitude, with a well-defined nucleus. No decided motion was observed in twenty minutes. Prof. Boss calculated the provisional elements given in the table, which show that the theoretical brightness at perihelion would be about seventy times the brightness at discovery. The same observer furnishes the following notes:

September 5. The comet has a soft but condensed light. The coma is somewhat less than 30" in diameter, and symmetrical. The condensation is very uniform toward the center, without a distinct nucleus. Under illumination the central parts—some 5" in diameter—appear as a star of 11.5 magnitude.

September 6. There is a very small nucleus of about the thirteenth magnitude.

September 10. The nebosity is elliptical, with axes of about 40" and 60" respectively. Nuclear condensation well marked, and is, perhaps, 10" south of the center of the nebulous mass.

Comet VI was discovered by E. E. Barnard, at Lick Observatory, October 31. He describes it as having no tail, a strong central condensation, of the eleventh magnitude, or fainter; the nebosity was 1' in mean diameter, and was much elongated.

We give the approximate elements of these comets in the following table:

Designation.	Gr. M. T. Perihelion passage.	Q	ω	i	Log. q .	Discovery.	Synonym.	Remarks.
1888, I....	1888, March, 16-96	945° 30'	850° 49'	42° 17'	9.54450	Feb. 16, Sawerthal...	Comet α , 1888	
II....	1888, June, 28	304° 39'	12° 58'	12° 58'	9.5852	July 8, Tebbutt....	β ,	Encke's α .
III....	1888, July, 30-25	101° 6'	57° 49'	74° 4'	9.95424	Aug. 7, Brooks....	γ ,	
IV....	1888, Aug., 20	209° 40'	11° 22'	11° 22'	0.240	Aug. 9, Nice Obs'ry.	δ ,	Faye's α .
V....	1888, Dec., 10-41	8° 28'	337° 44'	165° 7'	0.18688	Sept. 2, Barnard....	ϵ ,	
VI....	1888, Sept., 9-45	181° 52'	267° 10'	45° 53'	0.04964	Oct. 31, Barnard....	ζ ,	

vestigations of Mr. Sherman seem to point in the same direction as those of Dr. Backlund.

Comet III was discovered by W. R. Brooks, of Geneva, N. Y., August 7. On August 10, Prof. Boss reported the comet as small and condensed, and showing, with low powers, as a star of the ninth magnitude. It had a short tail with an estimated length of 10', and of the same breadth as the head. It had already passed perihelion when discovered, and was rapidly diminishing in brightness. It was thought that observations might be made up to the October moon.

Comet IV was found at Nice Observatory on August 9. The ephemeris shows that the comet is slightly increasing in brightness. This comet is one of the short-period comets. Its last appearance was in 1880; its period is 7.4 years. The present is its seventh appearance. This comet was first discovered by M. Faye, at the Paris Observatory, on Nov. 22,

W. F. Denning says that fourteen comets were discovered between 1827 and 1886, while between 1877 and 1886 forty-nine were discovered. In seven years E. E. Barnard and W. R. Brooks have discovered twenty comets—ten apiece—and to the end of 1887 they had received \$2,700 in prizes. In the September number of "The Observatory," T. W. Backhouse gives the following interesting table in regard to naked-eye comets seen since 1881:

COMET.	First seen with naked eye.	Duration of naked-eye visibility.	Greatest length of tail.
1881, β (Great).....	1881, June 29.	89 days	20½°
1881, ϵ (Schaberle's)....	1881, July 27..	82 "	10½
1882, α (Wells's).....	1882, May 11..	24 "	1
1882 (Great).....	1882, Oct. 1....	133 "	88
1883, β (Pons-Brooks's)...	1883, Nov. 19..	70 "	64
1883, δ (Fabry's).....	1886, March 29	29 "	88
1886, γ (Barnard's).....	1886, Nov. 9..	49 "	27½
1888, α (Sawerthal's)....	1888, April 7..	87 "	64

Double and Binary Stars.—J. E. Gore gives in the "Monthly Notices of the Royal Astronomical Society" for December, 1887, formulæ for the rectangular co-ordinates of the double star Σ 1847, and gives the proper motion of the star as $0.1053''$ per annum in the direction of position angle 114.1° . The following table gives:

STAR.	ρ Eridani.	λ Ophiuchi.	γ (ρ) Ophiuchi.	Σ 1847.
Time of periastron.....	T	1787.9	1507.65	1878.52
Position of node.....	Q	$185^\circ 0'$ (1870)	$105^\circ 5'$ (1900)	$120^\circ 5'$ (1880)
Position of periastron.....	λ	$240^\circ 0'$	$153^\circ 5'$	$171^\circ 45'$

The Sun.—The minimum period for sun-spot occurrence was prolonged during the first four months of 1887. There was a sudden slight increase in the number of spots in the beginning of May, 1887. In the present eleven-year period two minima have occurred: one, from Sept. 22 to Dec. 8, 1886, and the other from January to May, 1887. Including both of these periods in the same minimum, by neglecting the interruptions at the close of 1886, then the whole minimum period includes 222 days, and the date of the minimum may be given approximately as Jan. 10, 1887. This does not refer to the absolute minimum for this eleven-year period. On Oct. 28, 1887, some faculæ, attached to a group of faint spots, are reported to have become on a sudden intensely bright, and faded again as quickly. No other change of importance occurred in the spots themselves, or in their neighborhood. Within three minutes both faculæ and spots had entirely disappeared. The magnetic instruments indicated no disturbance. There were many days in 1887 when the sun was without spots, but very rarely were faculæ entirely absent.

Saturn.—Many skillful observers, among whom may be mentioned M. Trouvelot, Dr. Terby, and Mr. Elger, consider that the rings of Saturn are not stable, but are subject to continual changes. Dark masses have been observed on ring O, indentations have been seen on its inner edge, and other noticeable appearances recorded. Some astronomers have been inclined to consider that these appearances have no real existence, but that they are due to bad seeing, distorting eye-pieces, etc. Prof. Hall, in using the great Washington glass, was, we think, unable to see some of the markings drawn on the rings by Trouvelot in his well-known picture of Saturn, as seen with a 26-inch instrument. Mr. Keeler, of Lick Observatory, in the February number of the "Sidereal Messenger," in speaking of the distortion of Saturn's shadow, drawn by Trouvelot, says he had often noticed the distortion "when observing with the 12-inch equatorial, with a low power on a poor night; but it always disappeared on employing a sufficiently high power, or with improvement in the definition."

The 36-inch equatorial of Lick Observatory shows, "at a little less than one fifth of the width of the ring from its outer edge, a fine but distinct dark line, a mere spider's thread, which could be traced along the ring nearly to a point opposite the limb of the planet. This line marked the beginning of a dark shade,

which extended inward, diminishing in intensity, nearly to the great black division. At its inner edge the ring was of nearly the same brightness as outside the fine division. No other markings were visible."

In the supplements to the "Pulkowa Observations," Prof. H. Struve discusses his own observations made with the 15-inch refractor in 1884-'86 on Iapetus, Titan, Rhea, and Dione, with a view to correcting the elements of these satellites and also of determining the mass and ellipticity of Saturn. Herr Struve's value of the mass of Saturn agrees closely with Beessel's, being $1 \div 3,498$; the sun being unity.

G. W. Hill, in the "Astronomical Journal," of July 12, 1888, discusses the motion of Hyperion and the mass of Titan. He points out the errors in the calculations of several computers, and gives as his value of the mass of Titan $1 \div 4,714$, the mass of the planet being unity.

Mars.—Prof. Schiaparelli's observations on Mars, made during the opposition of 1881-'82, have been published. His new map agrees in general with that drawn in 1879. There are some noticeable differences, however, these being in a region seen by a number of observers to undergo changes. The main interest of this memoir centers in the full account of the "remarkable duplication of many of the canals." Thirty duplications are recorded between December, 1881, and February, 1882. The author thinks the phenomenon is periodic, and he concludes that duplication is connected with a period corresponding to the tropical year of Mars, and depending on the martial seasons. The tendency to duplication is pointed out as showing itself in other regions of Mars. Other observers have noted this tendency. Schiaparelli thinks it impossible to deny the reality of the duplications, however difficult of explanation they may be. E. W. Maunder, in the September number of "The Observatory," in discussing Schiaparelli's observations, remarks that "it seems impossible to accept this as a description of a real objective change taking place upon the actual surface of the planet, though as a record of a subjective appearance it must be unhesitatingly received. Prof.

Schiaparelli's advantages in the way of keen and trained eye-sight, and telescopic and atmospheric definition are beyond challenge. Hitherto the puzzle has received no satisfactory solution, for Mr. Proctor's suggestion that the canals are rivers is quite irreconcilable with the account Prof. Schiaparelli has given of the

The Chief Meteor-Showers.—W. F. Denning gives, in the January, 1888, number of "Monthly Notices of the Royal Astronomical Society," a list of the chief meteor-showers, derived from his observations made during the past fifteen years, the positions being corrected for precession, and brought up to 1890.

NAME OF SHOWER.	Duration.	Date of maximum.	Radiant point.	Sun's longitude.
1. Quadrantids	December 28-January 4	January 2	$\alpha = 229^{\circ} 8' \delta = + 52^{\circ} 5'$	281.6°
2. Lyrids	April 16-22	April 20	269.7 + 32.5	81.3
3. γ Aquarids	April 30-May 6	May 6	387.6 - 9.1	46.3
4. δ Aquarids	July 23-August 25	July 28	389.4 - 11.6	125.6
5. Perseids	July 11-August 22	August 11	45.9 + 56.9	188.5
6. Orionids	October 9-29	October 18	92.1 + 15.5	306.9
7. Leonids	November 9-17	November 13	150.0 + 29.9	231.5
8. Andromedes	November 25-30	November 27	25.3 + 48.8	345.8
9. Geminids	December 1-14	December 10	106.1 + 32.6	259.5

Notes.—2. Probably moving in orbit of Comet I, 1861. 3. Have orbital resemblance to Halley's comet. 4. Obvious displacement of radiant point from night to night. May have some connection with Comet III, 1862. 5. Radiant shows no displacement. 6. Observed from earliest times. Seen by Humboldt, 1799. Magnificent return in 1883, and splendid shower in 1866. Very meager during the last fifteen years. These meteors form a complete ellipse, and the earth meets a few at every passage through the node. But the meteors are nearly all massed in the neighborhood of their parent, Comet I, 1866. It is supposed that there are minor groups of meteors pursuing the same orbit; if so, we may have a revival of this display in 1898, for on the night of Nov. 13, 1922, shooting-stars, mingled with balls of fire, were seen in vast numbers at Potsdam, by Klöden. 8. Observed in 1798. Recurred in 1888. Very brilliant showers, Nov. 27, 1873, and 1885. It is uncertain whether this group forms an unbroken stream or not. Returns of the showers should be looked for in 1892 and 1896.

appearances he has observed. But it is quite likely that Proctor's further suggestion that they are 'optical products,' neither objective realities nor optical illusions, but phenomena of diffraction, may prove more satisfactory. Further observations are urgently desired to test the point—observations not confined to two or three favorable nights near opposition, but begun early and ended late, and carried on with the most persistent continuity."

In the "Astronomical Journal" for August, 1888, Prof. Asaph Hall, of Washington, D. C., says he made very careful observations of Mars during June, 1888. These were begun in the twilight, and were continued for eighteen nights, but he was unable to see anything like the regular canals drawn by the European observers. The only remarkable change he noticed was the diminution in the size of the white spot at the south pole of the planet. These observations were made with the great 26-inch instrument.

In the "Astronomical Journal" for September, Prof. Holden, of Lick Observatory, gives a series of drawings of Mars, as seen with the great 36 inch Lick telescope. He reports that they have seen none of the canals double, although many of the more important have been sketched as broad bands covering the spaces on Schiaparelli's map that are occupied by pairs of canals. The observations also fail to discover any important changes in the continent Libya, which had been reported as submerged.

Jupiter.—A remnant of the great red spot is still to be observed in the planet's southern hemisphere. This "rosy cloud" was first figured and described by Prof. C. W. Pritchett, of Morrison Observatory, Glasgow, Missouri, on July 9, 1878. The persistency of the spot has led some observers to consider that they were looking at the solid body of the planet through a hole, as it were, in Jupiter's clouds.

Mr. Denning gives some interesting data as to heights of fire-balls and shooting-stars. Eighty fire-balls, between 1865 and 1887, gave an average height at beginning of 69.2 miles, and 80.2 miles at end of flight. Comparing these heights with the heights of meteors (nearly all shooting-stars of the first magnitude or fainter), he gives the following table:

AUTHORITY.	No. of Meteors.	Height at beginning.	Height at ending.
E. Heis.	271	76.9 miles.	50.1 miles.
A. S. Herschel.	86	79.5 "	53.8 "
T. H. Waller.	49	81.4 "	52.4 "
W. F. Denning*	13	80.0 "	54.2 "

* Stars seen in 1887.

A careful discussion of the various records gives the following mean relative heights:

	At beginning.	At ending.	At middle course.
Fire-balls	69 miles.	80 miles.	49.5 miles.
Shooting-stars	80 "	54 "	67.0 "

It is supposed that telescopic meteors are at still greater elevations than the brighter forms of these bodies.

Meteorites.—In April, 1888, Prof. H. A. Newton read before the National Academy of Sciences a paper "Upon the Relation which the Former Orbits of those Meteorites that are in our Collections, and that were seen to fall, had to the Earth's Orbit." His studies lead him to adopt three propositions: 1. The meteorites that we have in our cabinets, which were seen to fall, were originally (as a class, and with few exceptions), moving about the sun in orbits that had inclinations less than 90° ; that is, their motions were direct, not retrograde. 2. Either the stones that are moving in the solar system across the earth's orbit move in general in direct orbits; or else, for some reason, the stones that move in retrograde orbits do not in general come through

the air to the ground. 8. The perihelion-distances of nearly all the orbits in which these stones move were not less than 0.5 nor more than 1.0 time the earth's radius. The author assumes as fully proved the connection of comets with meteors, and considers therefore that the meteorites have velocities relative to the sun not greater than 1.414 nor less than 1.244 time the earth's velocity in its orbit (earth's orbital velocity 18.38 miles a second).

Mr. Lockyer, in his paper read before the Royal Society, Nov. 17, 1887, gives the result of his experiments on meteorites. He examined meteoritic spectra under various conditions, particularly that of feeble temperature. He found it possible to obtain from meteorites spectra that showed the most peculiar features of almost every variety of spectrum—solar, star, nebular, and cometary. "In the spectra of nebulae, for instance, seven lines have been detected, of which three were traced to hydrogen, three to low-temperature magnesium, and the seventh, which has not yet been traced to its originating element, has been given by the glow from the Dhurmsala meteorite. The most characteristic nebular line was identified with the low-temperature fluting of magnesium, and the unusual spectrum obtained from the comets of 1866 and 1867 was ascribed to the same cause. The changes observed in the spectrum of the great comet of 1882 were such as would correspond to the changes induced by the change of temperature in the spectrum of a meteorite; and the changes in the spectrum of Nova Cygni, and the bright lines in such a star as R. Geminorum received a similar explanation; while a very full, in parts almost perfect, reproduction of a considerable portion of the solar spectrum has been obtained by taking a composite photograph of the arc spectrum of several stony meteorites, taken at random between iron meteoric poles. These and similar observations have led Mr. Lockyer to regard all self-luminous bodies in the celestial spaces as composed of meteorites, or masses of meteoritic vapor produced by heat brought about by condensation of meteor-swarms due to gravity, so that the existing distinction between star, comets, and nebulae rests on no physical basis. All alike are meteoritic in origin, the differences between them depending upon differences in temperature, and in the closeness of the component meteorites to one another. *Noæ* (new stars that blaze forth suddenly) are explained as produced by the clash of meteor-streams, and most variable stars are regarded as unconcentrated meteor-streams. Stars with spectra like that of Alpha Orionis (Rigel) are considered not as true suns, but as mere clouds of incandescent stones; probably the first stage of meteoritic condensation. Stars with spectra of the first and second type represent the condensed swarm in its hottest stages, while spectra of Secchi's fourth type indicate an advanced stage of cooling." Objection has been

raised to Mr. Lockyer's hypothesis by M. Stanislas Meunier. He contends that the only conclusion we are as yet entitled to draw from the spectroscopic researches on meteorites is, that they are composed of the same original matter as other celestial bodies.

The Observatory of Milan has published Part II, No. VII, of its observations. This last number contains a catalogue which is supplementary to two preceding ones. The first (1874) contained the observed paths of 7,152 meteors seen in 1872; the second (1882) contained 7,602 meteors, and the present publication contains 9,627 meteors.

Solar Physics.—The experiments of Prof. John Trowbridge and C. C. Hutchins lead them to conclude that there is unmistakable evidence of the existence of carbon vapor in the sun, and that at the point of the sun's atmosphere where the carbon is volatilized the temperature of the sun approximates to that of the voltaic arc. An exceedingly valuable contribution to science has been made by C. C. Hutchins and E. L. Holden in regard to the meaning of the lines in the solar spectrum. They say that "The dispersion given by the apparatus in the order of spectrum in which we work is such that a single wave-length occupies on the negative a space of 1.12 millimetres. This makes the distance between lines D₁ and D₂ 6.7 millimetres. We are convinced that there is much in the whole matter of coincidences of metallic and solar lines that needs re-examination; that something more than the mere coincidences of two or three lines out of many is necessary to establish even the probability of the presence of a metal in the sun." They have examined some of the doubtful elements in the list given by Prof. Young in his book on "The Sun," and find the evidence as follows: For cadmium, there were two perfect coincidences; for lead, cerium, molybdenum, uranium, vanadium, there was no good evidence in favor of their existence in the sun. Among the metals whose existence in the solar atmosphere has seemed probable, their experiments seem to show that bismuth and silver were present, but that tin, potassium, and lithium were doubtful. They also furnish evidence of the existence of platinum in the sun, claiming that between wave-lengths 4,250 and 4,950 to find 64 lines of platinum, 16 of which agree with solar lines.

Henry Crew has made some observations with the spectroscope on the period of the rotation of the sun. He obtained, for the mean equatorial velocity, 2,437 miles a second, which corresponds to a true period of rotation of 25.88 days. Mr. Crew thinks that, while the sun-spot layer (or photosphere, if they be the same) is accelerated in the neighborhood of the equator, the layer, which by its absorption gives rise to the Fraunhofer lines, tends to lag behind, having here a smaller angular velocity than in higher latitudes. Comparing the year 1886 with 1887, observers report that the average height of both the chromosphere and prom-

inences has been constant. The prominences had decreased in number. The heights of the largest prominences were much diminished. Some preliminary investigations in regard to the surface-currents of the sun seem to indicate: 1. That the direction at the poles is generally vertical to the limb; 2. That there is a decided current crossing the equator, sometimes in a northerly, and at other times in the southerly direction; 3. That changes of direction occur most frequently in mid latitudes.

Spectroscopy.—Prof. Grünwald, of Prague, has propounded a theory, according to which the wave-lengths of the lines due to a certain element in a given compound are to the wave-lengths due to that same element, when the first compound is combined with some further body, as the volume the element occupies in the first case is to the volume it occupies in the second. Examining the low temperature spectrum of hydrogen, he finds that the wave-lengths of its several lines are just double those of the lines of the water spectrum, line for line. Similar, but less simple relationships are given for other spectra, and Prof. Grünwald concludes from them that hydrogen and oxygen are compound bodies, and are dissociated in the sun. Hydrogen is inferred to have a composition of the form $A.b$; of which the supposed element A is associated with the line of the corona 1474 K; and b with the 'helium' line D_2 . Louis Bell, Fellow of Johns Hopkins University, has given, in the "American Journal of Science," a paper describing his careful determination of the wave-lengths of the D_2 line of sodium. The result is to increase slightly Thalen's correction of Ångström's value, the wave-length finally adopted being 5,896.08 tenth-metres. Prof. Rowland has followed this with a table of the relative wave-lengths of about 450 standard lines, based upon the above determination, and designed to be used in connection with his photographic map of the normal spectrum. R. Copeland considers that he has discovered a line in the spectrum of the Great Nebula of Orion corresponding to the place of D_2 . He remarks that "the occurrence of this line in the spectrum of a nebula is of great interest, as affording another connecting link between gaseous nebulae and the sun and stars with bright-line spectra, especially with that remarkable class of stars of which the first examples were detected by MM. Wolf and Rayet in the constellation of Cygnus." The Astronomer Royal of England, at the January, 1888, meeting of the Royal Astronomical Society, called special attention to two points of interest in the spectroscopic determinations of the motions of stars in the line of sight. One point referred to the motion of Sirius. This star has shown a complete reversal of motion since Dr. Huggins's first results. In 1868, Dr. Huggins found the motion to be 29 miles a second receding from the earth; in 1872, 18 to 22 miles a second. The Greenwich observations in 1875-'76, showed a mo-

tion of 24 miles a second. Subsequent years gave the following result: 1876-'77, 12 miles; 1877-'78, 23 miles; 1879-'80, 15 miles; 1880-'81, 11 miles; 1881-'82, 2 miles; thus showing a decreasing recessional motion. In 1882-'83 the motion was 5 miles a second, approaching the earth; 1883-'84, 19 miles, approaching 1884-'85, 23 miles, approaching; 1885-'86, 24 miles, approaching; 1886-'87, 1 mile approaching; and for the year 1887, 6 miles receding. These results are to be accepted with great caution, as astronomers are not yet fully satisfied that an apparent change in the displacement of the F. line indicates a real motion in the line of sight. The change of motion indicated by the above figures is very much larger than any that would appear probable from the known motion of Sirius in its orbit. The second point of interest referred to the orbital motion of Algol. The spectroscopic observations seem to show that this interesting variable is revolving about a primary, and that the system to which it belongs is, as a whole, approaching the earth. Further observations are necessary to establish anything definite. Prof. H. O. Vogel, in a communication to the Royal Prussian Academy, says that photography has been successfully employed to overcome the effect of atmospheric tremors, so noticeable in spectroscopic work investigating stellar motions. The time of exposure employed is from half an hour to two hours.

The Constant of Aberration.—Prof. Hall has published the results of his reduction of the observations made in the years 1862-'67 upon α Lyrae by Profs. Hubbard, Newcomb, Harkness, and himself, with the prime-vertical transit-instrument of the Naval Observatory, for the purpose of determining the constants of nutation and aberration. He obtained as the most probable value of the constant of aberration, $20.4542'' \pm 0.0144''$. This, with Michelson and Newcomb's determination of the velocity of light, gives for the solar parallax a value of $8.810'' \pm 0.0062''$.

Resisting Medium.—Freiherr v. Haerdtl, a pupil of Oppolzer, lately read a paper at Kiel University on the periodic comet of Winnecke. He found no indication of any influence on the comet's motion due to a resisting medium. On the other hand, O. T. Sherman considers that the variations in the motion of Encke's comet, other than those produced by planetary attraction, are caused "by a resisting medium connected with the sun, and disturbed by those forces which produce and are produced by sun-spots." He considers "that the zodiacal light is intimately connected with these disturbing forces, being in fact a locus of condensation of matter driven from the sun similarly to the tail of a comet from the nucleus, and after condensation again precipitated upon the solar surface."

Catalogues.—Le Verrier, on becoming Director of the Paris Observatory in 1854, planned to reobserve Lalande's catalogue of 47,890

stars. He considered it necessary to make three observations in right ascension, and three in declination. Up to 1879 only about one third of the observations had been made. The annual number of observations was about 7,000. Since 1879 the instruments have been increased by the Bischoffsheim meridian circle, and the director, Admiral Mouchez has augmented the observing-staff. During the past eight years the number of observations for the catalogue has amounted to about 27,500. The first installment of this valuable catalogue has been published in two volumes, one devoted to the catalogue, and the other to the individual observations. The stars are in the first six hours of right ascension, observed during the years 1837 to 1881. It contains 7,245 stars, and represents 80,000 observations in both elements. The introductory chapters contain a comparison of the Paris Catalogue with Auwer's reduction of Bradley. M. Bossert furnishes a valuable investigation of the proper motions of 374 stars in the catalogue, and supplies a long list of errors in Lalande.

In the Dunsink Catalogue of 1,012 southern stars, by Rambaut, most of the stars are between 2° and 23° south declination. The observations were made between November, 1882, and September, 1885, and are of stars which needed reobservation.

The second part of the eighth volume of the O'Gyalla Catalogue has been recently published. This catalogue briefly indicates the character of the spectrum of each star observed in the zone selected, which lies between the equator and the 15th parallel of south declination. The publication is intended as a continuation of the spectroscopic study of the northern heavens projected some years ago by Prof. Vogel and Dr. Dunér. The faintest stars observed are of the $7\frac{1}{2}$ magnitude. The third volume of the Potsdam "Observations" gave the first installment of the survey, the number of stars being 4,051, lying in the zone between 20° north and 1° south declination. The O'Gyalla Catalogue contains 2,022 stars. The spectra show that types I α and II α are most frequent. Only three cases of III δ are given.

The ninth volume of the "Observations" has also been issued and contains those observations made in 1886. Dr. Konkoly describes instruments and methods. Spectrum-photometry of thirty-four fixed stars and of the planets Mars, Jupiter, and Saturn is the most original of the work. Some nebulae and comets, and some special stars, were examined photometrically or with the spectroscope. Many notes in regard to the appearance of the solar surface on each day of the observation, and a table of positions of sun-spots for 1886, are given. A large number of meteor observations and a list of radiant completes the volume.

Volume xlix, Part I, of the "Memoirs of the Royal Astronomical Society" contains Dr. Dreyer's new general catalogue of 7,840 nebulae and clusters of stars, being the catalogue

of the late Sir John F. W. Herschel, revised, corrected and enlarged. The Council of the Royal Astronomical Society has printed an additional 225 copies of this catalogue, on account of its value to astronomers. It is supposed to give the records of all nebulae of which the places have been published up to December, 1887.

A. M. W. Downing, in the May, 1888, "Monthly Notices of the Royal Astronomical Society," gives the positions for 1,750, and proper motions for 154 stars south of 29° south declination. This catalogue is deduced from a revision of Powalky's "Reduction of the Star-places of Lacaille's 'Astronomiæ Fundamenta.'"

Dr. Peters, of Hamilton College, Clinton, N. Y., has undertaken to collate all available existing manuscripts of Ptolemy's catalogue, for which purpose he has visited the principal libraries of Europe and has the assistance of Mr. Knobel of England.

Pulkowa Observatory has published the catalogue for 1865 of the principal stars to the fourth magnitude, as far as 15° south declination. This catalogue re-examines the stars in the old catalogue for the epoch of 1845.

J. G. Porter has published the result of two and a half years' work with the three-inch transit. The catalogue contains 4,050 stars between $18^{\circ} 50'$ and $22^{\circ} 20'$ south declination. Most of the stars down to the 8.5 magnitude have been observed, as well as some fainter ones. The proper motions of 75 stars are given in the appendix.

S. C. Chandler has published a valuable catalogue of variable stars, in Nos. 179 and 180 of the "Astronomical Journal." The catalogue has been printed separately for distribution. The author says: "Thirteen years have passed since the appearance of Schönfeld's Second Catalogue of variable stars. A work that shall represent the knowledge of to day as that did the knowledge of its date, is an urgent need of this branch of astronomy." This preliminary catalogue is issued in hopes of supplying that need. A great deal of care has been given to its preparation. The catalogue shows that of the 225 stars comprised in it, 160 are distinctly periodic; 12 belong to the so-called *Novæ*. Of the periodic variables, Mr. Chandler has been able to assign both maximum and minimum epochs for 63 stars; maximum epochs alone for 82; minimum epochs alone for 14, 9 of these being of the Algol type. The elements of 124 stars are the results of Mr. Chandler's own investigations; for 22 he has adopted those of Schönfeld, and for 14 those of Argelander, Gould, Parkhurst, and others, after independent examination had shown that the data at hand would not give essentially improved values. He has added to the catalogue an arbitrary estimate of the color or redness of many of the stars. The catalogue also contains a list of some of the doubtful cases of variables.

Polaris.—T. H. Safford gives the year 2102 A. D. as the time of nearest approach of Polaris to

the north pole, when the declination will be $89^{\circ} 32' 23''$. The star, he says, will reach 89° about the year 1944, and be for about 300 years within a degree of the pole.

Medals.—The gold medal of the Royal Astronomical Society of England was awarded on Feb. 10, 1888, to Prof. Arthur Auwers, for his re-reduction of Bradley's observations. At the April meeting of the National Academy of Sciences of the United States, the Draper Astronomical Medal was presented to Prof. Edward C. Pickering, Director of the Harvard College Observatory. At the same meeting the Lawrence Smith Medal for original work on the subject of Meteorites, was awarded to Prof. Hubert A. Newton, of Yale College, New Haven, Mass.

Bibliography.—A large number of valuable papers have been printed in the serial publications devoted to astronomical knowledge, and during the year the following books have been published: "The Asteroids or Minor Planets between Mars and Jupiter," by Daniel Kirkwood; "Movements of the Earth," by J. Norman Lockyer; "Old and New Astronomy," several parts, by Richard A. Proctor; "Astronomy for Amateurs," by Thomas W. Oliver; "The New Astronomy," by Samuel P. Langley. "A Text-book on Astronomy," by Prof. Charles A. Young. The Smithsonian Institution has published a "Bibliography of Astronomy for the year 1887," by William C. Winlock, of the U. S. Naval Observatory at Washington, D. C.

Messrs. Chandler and Ritchie have published the new "Science Observer Code," to be used in the telegraphic distribution of announcements of discovery and of positions from Oct. 1, 1888.

ATLANTIC OCEAN, HYDROGRAPHY OF. Rapid progress has been made of late years in the acquirement of knowledge concerning the sea and its phenomena. Especially is this true of the great ocean subdivision known as the "North Atlantic." With its dependent gulfs and seas, this ocean covers an area of something like 18,000,000 square miles, about one eighth of the total sea-surface of the globe. Commercially its importance largely exceeds that of all other oceans. Lying as it does between the great civilized continents, Europe on the east and America on the west, its commerce is as a hundred to one when compared with that of larger and more remote seas. For this reason it has been more thoroughly explored than any other ocean-tract, and its phenomena of tides and currents, winds and temperatures, depths and shallows, are better known.

The Hydrographic Office of the United States Navy has always been in the front rank of investigation. Struggling from the first with meager appropriations, it has nevertheless contributed its full share to the world's knowledge of this great highway of civilization.

Among the most creditable of its recent undertakings is the publication of monthly pilot-

charts, showing not only the meteorological conditions that may be looked for with reasonable certainty, and the more or less regular variations of currents, but all the obstacles, floating wrecks and the like, of which any trustworthy intelligence can be obtained. To these are added what may be termed the eccentricities of natural phenomena, such as cyclones, water-spouts, the appearance of whales, etc. The course taken by all exceptionally severe storms is noted, and, as the charts are of a convenient size (24×80), they can be easily kept for reference in a drawer or in a portfolio, and thus afford a highly valuable record of the sea and its mysteries, for the benefit of navigators.

A single instance may be cited: The collision between the steamers "Thingvalla" and "Geiser" is among the most startling of recent disasters. If the captains of those vessels had followed, even approximately, the courses plotted for transatlantic steamers on the pilot-chart for August, both vessels might have been still afloat, and the hundred and more persons that went down with the sinking ship might yet have been alive.

The monthly issue of the pilot-chart is on "Mercator's projection," so called, and includes the whole area between the sixtieth parallel of north latitude and the equator. The preparation of each edition involves three printings, namely, the "base," "the blue data," and the "red data."

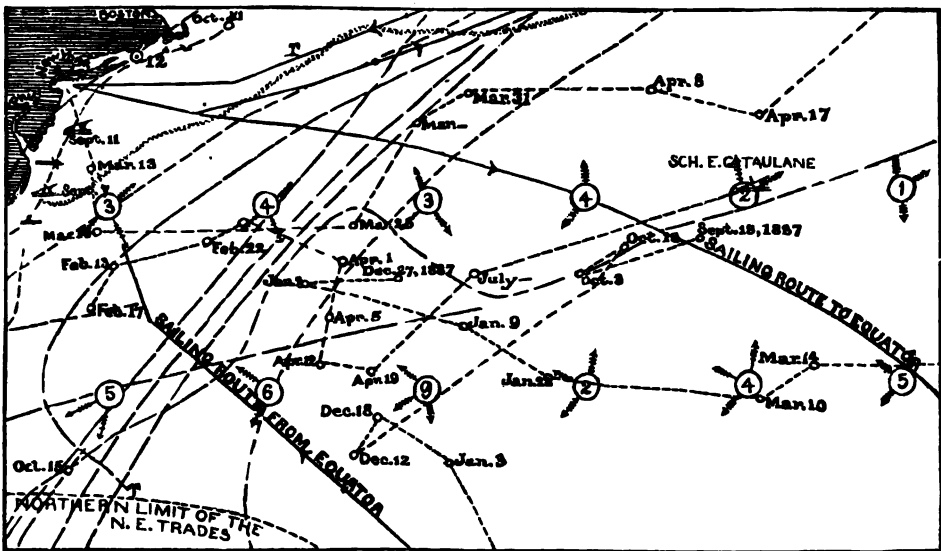

I. The base may be termed the *constant* of the chart. It is printed with black ink, and includes only the permanent features of sea and shore. Coast-lines, islands, and the like, are clearly marked, also the general set of currents, the compass-card, explanatory tables, storm-cards, etc. The parallels of latitude and longitude divide the whole into squares of ten degrees on a side, and these again are subdivided into what are known as "ocean-squares," of five degrees each. To avoid confusion of lines, these smaller squares are not shown, but they are easily plotted by quartering the large parallelograms.

II. The "blue data," which are printed directly over and upon the permanent data, consist mainly of a meteorological forecast for the month following the date of issue. There are also included the principal sailing-routes and steamship-routes recommended for the month. These routes vary from month to month, according to well-established laws. Thus, in the summer months, the probable southern limit of icebergs is tolerably well known, and the steamer-routes are carried well southward of the danger-line. So in regard to the ordinary sailing-routes, it is probable that any vessel following the sailing directions of the pilot-chart will shorten her voyage by days or hours, according to the length of the trip. These sailing-routes are plotted from the logs and special reports of vessels, which have been accumulating in the Hydrographic Office since

its establishment in 1829. The charts and circulars of information are sent free to masters of vessels, who, in return, are generally ready and glad to furnish special reports. In this way it has been possible to gather trustworthy details concerning almost every "ocean-square" in the North Atlantic. Some of the squares are, of course, more frequently crossed by vessels than others, and the average direction and force of the wind in these squares can be stated with reasonable certainty for every month in the year. A simple and ingenious system of symbols has been adopted for the charts, whereby the meteorological probabilities may be forecast for a given square by any one who takes the trouble to look. Of course, the forecasts are not absolutely certain of realization, but the chances are that they will not be far out of the way. The map on this page is a portion of the pilot-chart for

different prevailing winds. The lines of long dashes show the course of recent storms, and the short ones the drift of derelict vessels with the dates when reported.

III. The "red data" embrace the very latest information that has been gleaned from all possible trustworthy sources up to the hour of going to press. The printed information covers the land-spaces of the chart, and includes a list of all recent changes of lights, buoys, beacons, etc., condensed special reports of noteworthy events, accounts of extraordinary storms, dangerous obstructions, and barometric comparisons. The symbolic data, also printed in red ink, show where drifting wrecks were last seen, and mark the erratic courses that they have followed as they have been encountered from time to time by different vessels. In like manner, water-spouts, drifting buoys, floating logs, and everything that is dangerous to navi-

PILOT-CHART FOR OCTOBER, 1888.

October, 1888, lying eastward of New York. For typographical reasons the different colors of the data are not shown, but some idea of the completeness of the information is afforded. Each of the small circles with divergent arrows represents an ocean-square. The numeral within the circle represents the percentage of calms; 7, for instance, indicates that there are seven chances in one hundred that calms will be encountered. The arrows fly with the wind, showing its direction, and they indicate the direction of the prevailing winds. The small cross-bars show the average force of the wind, according to Beaufort's scale—the standard commonly used by seamen. Thus, four cross-bars indicate 4 of Beaufort's scale, namely, a "whole-sail" breeze, as it is called. The various lengths of the arrows indicate the greater or lesser frequency of the

gation, finds a place on the pilot-chart, which may very probably serve as a warning to save life and property.

One of the most remarkable cases recorded on the charts is that of the extraordinarily named American schooner "Twenty-one Friends." She was abandoned at sea, and first reported as a derelict, March 24, 1885, about 160 miles off the mouth of Chesapeake Bay. The Gulf Stream carried her east-northeast about 2,130 miles, where she was reported in August. Thence she drifted easterly and southeasterly, and was last reported, Dec. 5, 1885, in the Bay of Biscay, having drifted 3,525 miles in eight months and ten days. During her wanderings, which were largely in the most frequented part of the ocean, she was reported twenty-two times, and the number of vessels that passed near her without seeing

her can of course never be known. The dotted red line that represents her course on the pilot-chart is only one of many that cross and re-cross one another in all directions.

Wide as the ocean is, not a year passes without mysterious disappearances. Many of them are doubtless due to collisions with "derelicts," as they are termed by the Hydrographic Office, or with some of the many other drifting obstacles recorded by the "red data" of the pilot-charts.

The headquarters of the Hydrographic Office are in Washington, but the branch-office in New York, under the management of Lieut. V. N. Cottman, U. S. N., bears a most important part in the active work of the bureau. This office occupies by courtesy a corner of the Maritime Exchange, situated on the lower floor of the great Produce Exchange building. Perhaps no better place could be found to keep the bureau in touch with the great shipping interests of the world. To the Maritime Exchange almost every ship-owner, captain, and underwriter goes on business or to give and receive information, and in this way many valuable facts are secured at the latest possible moment before going to press. It is somewhat humiliating that such an important and beneficent Government work should be carried on in such narrow quarters; but, on the other hand, it is a high compliment to its usefulness that a great business organization like the Maritime Exchange should freely make room for it, where space is cramped at best, and where every square foot has a money value.

The official records show that during the year 6,739 vessels were visited; nautical information was furnished to 83,345 masters of vessels and others; 10,397 pilot-charts were gratuitously distributed, and 8,601 special detailed reports on the subject of marine meteorology were forwarded for use in the preparation of the pilot-charts.

The practical value of the branch-offices has led to their establishment in other seaports, and they are now in operation at Baltimore, Boston, New Orleans, New York, Philadelphia, and San Francisco. Every year there are between 5,000 and 6,000 lives lost at sea, and, while with the increase of commerce this average is not unlikely to be maintained, the Hydrographic Office is engaged in a noble work in reducing the chances of disaster.

The popular notion that sailing-vessels are being driven from the seas by steam competition is said by good authority to be erroneous. The sailing-tonnage of the world is, and probably always will be, nearly or quite double that of steam. It is not generally realized that, in spite of the long period of depression to which the American merchant marine has been subjected in consequence of the war for secession and because of congressional indifference, the tonnage of the United States is second only to that of Great Britain, and nearly double that of any other nation.

The publication of the pilot-charts was begun in December, 1884, and they have made their way by mere force of merit into the chart-rooms of all nations. The co-operation of the Signal Service and of the Naval Bureau was cordially given, and merchant-captains were quick to recognize the value of the undertaking, and became at once willing contributors to the stock of general information.

None of the other maritime nations have as yet attempted to follow the example of the United States in the issue of pilot-charts. That they will sooner or later do so is to be expected, but at present the United States Hydrographic Office may be pardoned for a reasonable degree of pride in its unique and original work.

AUSTRALIA, a continent surrounded by the Pacific Ocean, forming a part of the British Empire. The areas of the colonies occupying the Australian continent, with that of the neighboring island of Tasmania and the colony of Fiji, and their estimated population at the close of 1886, are as follows:

COLONIES.	Area.	Population.
New South Wales	310,700	1,001,996
Victoria	87,584	1,008,048
South Australia	908,425	812,758
Queensland	668,497	342,614
Tasmania	26,875	187,811
Fiji	7,740	126,010
Total	2,004,621	2,928,782

The estimated population of Australia and Tasmania on Jan. 1, 1888, was 2,948,864. In the whole of Australia the number of persons to the square mile is less than one. In Victoria it is 11.79; in New South Wales, 3.37; in Tasmania, 5.40. The total excess of arrivals over departures by sea for the whole of Australasia (including New Zealand) in 1887, was 64,856, showing a decrease as compared with the previous year of 5,671. The excess was greatest in New South Wales, where it was 28,516, whereas in South Australia the departures exceeded the arrivals by 2,384. At the present rate of increase the population of the Australian colonies in the year 1900 will be 5,000,000.

The aggregate revenue of the Australasian colonies in 1885 was £28,750,000, and the aggregate expenditure, £25,250,000. In twelve years the revenue had increased 94 per cent., while the population had increased 54 per cent. The total debt was £70,250,000, or £3 8s. 9d. per head of population. Between 1851 and 1886 the value of the gold mined in all the colonies was £324,000,000, of which Victoria produced £217,000,000.

Agriculture.—The census tables show that 31 per cent. of the people of Australasia from whom statistics could be collected (about 40 per cent.), are engaged in agricultural occupations, while 31 per cent. follow manufacturing and mining, 10 per cent. are employed in trade and transportation, 17 per cent. in professional

occupations, and 11 per cent. as laborers. Of the last category a large percentage are employed in field-labor, while the inhabitants of the remote districts, concerning whom there are no returns, make the ratio of agricultural producers much larger than appears in the statistics. All the colonies have pre-emption laws to attract agricultural colonists, but most of them have been late in introducing the system in a practical shape, and slow in improving their first illiberal regulations, owing to the antagonistic interests and influence of the wool-growers. There is an apparent profit to the state in this policy, for while a large income is flowing into the exchequer from pastoral leases, the selling value of the public lands is constantly rising. Public men have recently, however, become impressed with the shortsightedness of a policy that has retarded the growth of the colonies, and with the liberalization of the land laws the democratic sentiment grows stronger and the money-power of the lease-holders is losing control over the policy of the Government. The graziers are nevertheless able, by fictitious entries and by the actual use of force, to keep settlers out of lands that are by law open to them. The laws of New South Wales provide for the selection of farms of 640 acres or less at the price of 20s. an acre, to be paid for by installments of 1s. an acre, interest being charged at the rate of 4 per cent.; also of grazing-farms of 2,560 acres, which, like the agricultural homesteads, must be fenced. Victoria allows deferred payments of 1s. an acre per annum on 320 acres at the same uniform price, on condition that improvements costing 20s. an acre shall be made on the land. South Australia sells to homesteaders a maximum area of 1,000 acres at the same price and terms of payment, requiring 10s. worth of improvements. Queensland grants homesteads of 160 acres for only 2s. 6d. an acre, payable at the rate of 6d. annually, if 7s. 6d. worth of improvements are made, and permits other selections of from 320 to 1,280 acres at no fixed rate of payment, but on the condition of improvements of the value of 10s. to the acre. South Australia and Western Australia each fix the maximum size of the settler's holding at 1,000 acres, the price being in the former 20s., and in the latter 10s., payable in twenty annual installments, each colony requiring improvements of 10s. an acre, while in Western Australia the land must in addition be fenced. In Tasmania settlers can take up 320 acres at 20s., paying 2s. a year without further conditions. The privilege of selecting land in this colony was taken away from fresh immigrants, whether they have paid their passages or have been aided by the Government, by an act that went into force in 1888.

The number of acres that had been sold up to the beginning of 1887, and the area that was not yet alienated in the several colonies, were as follows:

COLONIES.	Total taken up.	Remaining in crown.
Victoria.....	22,459,883	88,756,877
New South Wales.....	41,385,464	156,556,586
Queensland.....	10,995,874	416,667,988
South Australia.....	11,278,944	566,918,056
Western Australia.....	2,155,895	622,432,905
Total.....	88,205,060	1,796,356,860
Tasmania.....	4,513,454	12,866,546
Grand total.....	92,718,514	1,809,223,406

Of the total area now cultivated in the Australian colonies 3,697,954 acres are devoted to wheat, yielding 45,541,592 bushels, of which about 9,000,000 bushels were available for export in 1886. Since then the home requirements have gained on production, leaving a smaller surplus.

The increase of live stock is shown by the following figures:

STOCK.	1870.	1884.
Horses.....	797,800	1,804,285
Cattle.....	4,712,918	8,464,370
Sheep.....	51,294,241	75,026,404
Pigs.....	694,848	1,108,940

In 1872 the exports of wool from all these colonies amounted to 181,459,780 pounds, and in 1885 to 404,088,149 pounds. In 1886, however, owing to the damage by rabbits, the total production was only 398,541,828 pounds, the average per sheep being 4.62 pounds, and the total value, £16,218,846. The average value was 9½d. a pound, and the total represented £4 16s. 4d. a head of the population.

The Rabbit Pest.—About twenty years ago the colonists of Australia and New Zealand, having grown prosperous during the period when the civil war had stopped the production of wool in the United States and caused the price to rise, began to found societies of acclimatization for the introduction and breeding of hares and rabbits, in order to enjoy the sports to which they had been accustomed in England. Every land-owner became anxious to secure ground-game on his own estate. Their satisfaction at finding the soil and climate adapted for the animals was of short duration; for at the rate of ten litters a year, instead of four and six, as in England, with no natural enemies to keep down their numbers, the rabbits, which grew to enormous size, in a few years began to affect seriously the sheep-industry and check agricultural operations. They consumed the herbage up to the doors of the farm-houses, destroyed orchards and vegetable gardens, caused the abandonment of land that had produced thirty bushels of wheat and sixty of barley to the acre, and ate the grass down to the roots, turning to desert immense tracts of pasture, and driving both sheep and farmers from entire sections of the country. Wealthy proprietors, after spending large sums in the effort to exterminate the vermin, ended by abandoning their estates. Shooting, trapping, hunting with fer-

rets, and poisoning with arsenic, strychnia, and phosphorus, destroyed them by millions, yet checked but slightly their multiplication. Wire-fences were early tried to confine them within bounds, but they burrowed beneath the inclosures without difficulty. Since then, however, rabbit-proof fences have been devised, yet in some localities they have learned to leap over fences that were considered a perfect barrier. The Government of New South Wales, for the purpose of protecting the populous districts of the eastern division, proposes to build a wire fence, 400 to 500 miles long, from Albury to the borders of Queensland, at an estimated cost of £770,000. The Parliament of that colony offered a bonus of sixpence for every rabbit killed, and the payments under the act have increased in rapid progression, the sum called for in 1886 being £146,000, in 1887 about £250,000, and in 1888 it was calculated to amount to £500,000. The same Government has now offered a reward of £25,000 to any person who shall invent an effective process for the extermination of rabbits that shall not be injurious in its operation to horses, sheep, or other domestic animals. The inventor must demonstrate the efficacy of his method or process, which must be one that is yet unknown in the colony, at his own expense, and will receive the prize after a year's trial. Pasteur, who discovered remedies for the silk-worm disease and cattle-disease, communicated to the agents-general in London a method that he had already tried with success in France. This is to produce an epidemic of chicken-cholera, a disease that is very infectious and fatal among rabbits, though harmless to other animals, except poultry. In the spring of 1888 a party of French and English scientists went to Australia, taking with them infusions containing the microbes of this disease, with the intention of introducing the infection among the rabbits of various localities by laying before them contaminated food, after which it was expected to spread spontaneously.

The Federal Council.—The British Parliament in 1885 authorized the formation of a council of the colonies, to meet at least once every two years for discussion and united action on matters of common Australian interest. The second meeting of the council was held at Hobart, Tasmania, the regular place for assembling, in January, 1888, terminating a three-days' session on the 19th. New Zealand, South Australia, and New South Wales had not joined the confederation, and the representatives of the other colonies discussed the means of inducing them to take part in the councils.

The New Hebrides.—The anxiety of the Australians on account of the French occupation of the New Hebrides islands abated when the French Government set a date for the withdrawal of the military force. A convention for a joint naval commission was signed on Nov. 16, 1887, and the French agreed to evacu-

ate the islands within four months from that date. On Jan. 26, 1888, the English and French representatives signed at Paris a declaration defining the functions and powers of the Anglo-French Naval Commission, and establishing regulations for its guidance. The commission consists of a president and two British and two French naval officers. It is charged with the maintenance of order and the protection of the lives and property of British and French citizens in the New Hebrides. The presidency of the commission shall be held in alternate months by the commanders-in-chief of the British and French naval forces present in the group. The regulations provide that in the event of a disturbance of peace and good order in any part of the New Hebrides where British or French subjects are found, or in case of danger menacing their lives or property, the commission shall forthwith meet and take measures for repressing disturbance or protecting the interests endangered, but not resorting to military force unless its employment is considered indispensable. If a military or naval force lands, it must not remain longer than is deemed necessary by the commission. In a sudden emergency the British and French naval commanders nearest the scene of action may take measures for the protection of persons or property of either nationality, in concert if possible, or separately when only one force is near the disturbed locality; but they must at once report to the senior officers, who shall communicate the report to each other, and immediately summon the commission. The commission has no power to interfere in disputes concerning title to land or to dispossess either natives or foreigners of lands that they hold in possession, but it is charged with the police duties of stopping the slave-trade with the Kanakas and of preventing acts of piracy. The last of the French troops left the New Hebrides on March 15.

The Chinese Question.—Anticipations of an increase of Chinese laborers and of the effect of their competition on the condition of the white laboring class, have produced an exciting political and international question in the Australian colonies. Two high commissioners, accredited by the Chinese Government, visited Australia in May, 1887, with the objects of learning the manner in which their countrymen were treated and of advancing commercial relations between the two countries. They found little to complain of in the treatment of the Chinese, but questioned the rightfulness of restrictions on immigration that have recently been introduced, especially the head-tax that is imposed in the various colonies. The Chinese ambassador in London, on Dec. 12, 1887, asked the explanation of this exceptional legislation, and objected to it as a violation of treaty obligations. Chinese competition is most severe on the tropical northern shores of Australia, especially in the Northern

Territory of South Australia. The white residents of the territory in the spring of 1888 addressed a memorial to the Governments of New South Wales, Victoria, and Queensland, urging restrictive measures, in which they blamed their own Government for introducing the evil by importing Chinese laborers for the gold-mines at public expense, and afterward allowing them to squat on Government lands, to bid for Government contracts, and to vote as rate-payers. From that district they had advanced inland by way of Roper and McArthur rivers into Queensland and the South Australian ruby-fields. The Governor resident at Port Darwin in the beginning of April advised the authorities in Adelaide of information that had come to him, according to which vessels sailing under the Chinese flag were preparing to land a great number of Chinamen to work the ruby-mines. The Government has hitherto encouraged the immigration of Chinese into the territory, because they alone have developed the agricultural resources of the land, and are almost the only laborers who will long remain and work in the mines. Without them it would not have been possible to build the Port Darwin Railroad, which is expected to make the territory prosperous and self-supporting. There are at present 6,000 Chinese in the Northern Territory and only 600 Europeans. There is a regulation limiting the Chinese to a distance of 1,000 miles inland, but the South Australian Government proposes now to adopt in respect to the Northern Territory the same restrictions on immigration that prevail in the rest of Australia. The Chinese question is treated by Australian politicians as a workman's question, although the workmen there, unlike those of California, have not yet felt the direct competition of Chinamen in the trades, save in furniture-making, which the Chinese have learned and pursue on their own account. They have been very successful as gardeners, and have taught the English colonists many improvements in the cultivation of fruits and vegetables. The large cities are entirely supplied with such produce from their gardens. Once before, when the Chinese, who began to come in 1851, increased from 2,000 in 1854 to 42,000 in 1859, Victoria imposed a capitation tax on immigrants, which had the effect of reducing the Chinese population to 20,000 by 1863, when the poll-tax was removed. The first of the more recent measures was passed in 1881 in consequence of the action of the authorities of Western Australia, who were about to import Chinese laborers. The Chinese evaded the tax by procuring letters of naturalization, which their countrymen in Victoria began to take out in unusual numbers. While only 91 letters had been issued to Chinese during the eleven years preceding, there were 317 naturalizations in 1882, and the number increased to 1,178 in 1885. The arrivals by sea had fallen on the imposition

of the head-tax from 1,348 in 1881 to 327 in 1882, and then increased at almost the same rate at which naturalization papers were taken out, until they reached 1,108 in 1886. In 1885 additional precautions were taken in connection with the forms of naturalization, in order to prevent fraudulent personation, and there was an increase of 488 in the number of arrivals in 1886 over the previous year, because the papers that had been purchased from Chinese residents in the colony would not be thereafter available. By the laws of Victoria and New South Wales, a poll-tax of £10 is payable on every Chinese immigrant, for which the master of the vessel is responsible, and no vessel is allowed to bring more than one immigrant for each 100 tons. Queensland collects a tax of £30 on each Chinaman landed, and limits the number that can be brought in a vessel to one for each fifty registered tons. Tasmania has adopted the restrictions that prevail in Victoria and New South Wales, and requires vaccination, as does South Australia, which, except for the Northern Territory, imposes a poll-tax of £10, but allows a passenger for every ten tons. In all cases Chinamen who are naturalized British subjects are exempt from the operation of the acts. In New Zealand an act was passed in 1882 restricting the immigration of any person born of Chinese parents, but this law has not received the approval of the home Government, and is inoperative. The number of Chinese in all the Australian colonies does not exceed 51,000, and is smaller than it was before the yield of gold began to fall off. Instead of increasing, the Chinese population is said to have diminished of recent years at the rate of 8 per cent. per annum. Living in compact colonies, they are conspicuous in the towns, though forming a very small fraction of the population. The only districts outside of the Northern Territory of South Australia where they outnumber the white population are the mining-camps and plantations of the torrid part of Queensland, where they have been introduced as laborers.

The question raised in the letter of Lew-ta-len, the Chinese Minister, was submitted to the premiers of the different colonies by Lord Salisbury. Sir Henry Parkes, replying for New South Wales, and D. Gillies for Victoria, urged the home Government to make a treaty similar to that which was being negotiated between China and the United States. Public meetings were held in the two colonies, much political feeling was aroused on the subject, street demonstrations took place, anti-Chinese riots were threatened, and, finally, the executives manifested their energy by prohibiting the landing of Chinamen and sending about four hundred back to China. The New Zealand Government, in order to accomplish the same object, declared all the ports of China to be infected districts. In the middle of May a severer Chinese restriction bill was introduced as a Government meas-

ure in the New South Wales Parliament, and passed the House of Assembly at once. It was made operative from the beginning of that month, and contained no exception in favor of immigrants who were then on the seas or in Australian ports. The act was virtually prohibitive, restricting the number of passengers to one for every 300 tons of the vessel carrying them, and raising the poll-tax to £100. Chinese were allowed to trade only in certain districts, and only five in each district. Naturalization of Chinese was forbidden. No Chinamen could mine without authority, and all must take out licenses annually to be allowed to reside in the colony. The Legislative Council refused to suspend the rules to hurry the passing of the bill, and meanwhile the supreme court granted writs of *habeas corpus* for the release of fifty Chinamen who were detained in Sydney Harbor, declaring their detention illegal. Two amendments of the Legislative Council, one keeping open the Supreme Court to persons who have claims for indemnity, and the other striking out the clause limiting the Chinese to certain areas and occupations, which latter was drawn in imitation of the existing regulations for foreigners in China, were accepted by the Assembly; and, when the Council stood firm, others were adopted by the Government, and finally accepted by the house, removing the features of the bill that were most flagrantly in contravention of the treaties, but not mitigating its severity as a restrictive measure. An intercolonial conference on the subject of restriction was held at Sydney. Its conclusions were embodied in the bill that was introduced in the Victorian Parliament, which opened its sessions on June 21.

The right of domicile of Chinamen in British dominions rests not merely on international law and the comity of nations, but on the first article of the treaty of Nankin, signed Aug. 29, 1842, which provides that there shall be peace and friendship between the sovereigns of Great Britain and China and between their respective subjects, "who shall enjoy full security and protection for their persons and property within the dominions of the other." This treaty was renewed by the one signed at Tientsin on June 26, 1858. The Pekin Convention of 1860 provides that Chinese in choosing to take service in British colonies are at liberty to enter into engagements and take passage in British vessels at the open ports, and that the Chinese authorities shall, in concert with the diplomatic representative of Great Britain, frame regulations for the protection of emigrants sailing from the open ports.

Traffic in Arms with the Pacific Islanders.—Great Britain has for three or four years been attempting to induce other nations to enter into an agreement prohibiting the sale of fire-arms and powder and of alcoholic liquors in the western Pacific. The consequences of supplying the natives with arms of precision are described in a blue-book on the subject. In some of the

islands the people kill each other in family and tribal feuds. The effect on the relations of the natives with whites is pointed out by Bishop Selwyn, of Melanesia, in a letter to the Colonial Office. Any outrage committed by a white man is sure to be avenged by a volley fired at the next boat's crew, and then a man-of-war is sent to punish the islanders, and a party landed, often in the face of a heavy fire, thus "exposing valuable lives for the most trivial of causes." Recently the boats of the "Eliza Mary" were fired on from the New Hebrides, the natives mistaking the English vessel for the "Tongatabu," a labor vessel flying the German flag, which had recruited laborers for Samoa under the pretense that they were for Queensland.

Without waiting for a convention, the governments of Queensland and Fiji in 1884 prohibited the sale of fire-arms to natives. But these regulations are evaded by the labor agents who find that guns and powder are the only price that will gain laborers for the sugar plantations. When an international agreement was proposed, France at once signified her willingness to enter into the compact if the other powers should do likewise. Germany returned no answer to the proposal. The United States declined to accede to the proposed regulations. Mr. Bayard in his reply recognized their general propriety and the responsibility of conducting such traffic under proper and careful restrictions, while signifying the intention of the Government of the United States for the present "to restrain its action to the employment, in the direction of the suggested arrangement, of a sound discretion in permitting traffic between its own citizens in the articles referred to and the natives of the western Pacific islands."

New South Wales.—The oldest of the Australian colonies has been self-governing since 1855. The present Governor is Lord Carrington, who entered on the office in December, 1885. The present ministry, which was constituted on Jan. 19, 1887, is composed of the following members: Premier and Colonial Secretary, Sir Henry Parkes; Colonial Treasurer, John Fitzgerald Burns; Minister for Lands, Thomas Garrett; Minister for Works, John Sutherland; Attorney-General, Bernhard Ringrose Wise, who received his appointment on May 27, 1887; Minister for Public Instruction, James Inglis; Minister for Justice, William Clarke; Postmaster-General, C. J. Roberts; Minister for Mines, Francis Abigail; President of the Executive Council, Julian Emmanuel Salomons, who represents the Government in the Legislative Council, but holds no portfolio.

The revenue in 1886 amounted to £7,594,800, of which £2,389,138 were derived from the state railways, £2,068,571 from customs, and £1,643,955 from the public lands, the sales amounting to £1,206,438. The revenue has increased from £22 per head of population in 1871 to £39 in 1886. The total expenditure in

as £9,078,869, being larger than in any year, and more than twice that of the expenditure on railroads, including the expenditure on post and telegraphs, £1,710,495; on other public works, £877; on the public debt, partly for extension of loans, £1,579,689; on public instruction, £741,121; on other services, £8,376.

The total expenditure in 1887 was £276, with an estimated revenue of £8,376.

The revenue for 1888 is expected to be £8,511,725, while the expenditure is estimated at £8,209,335. The public debt has increased from £7,880,230 in 1860, and £14,908,1880, to £41,034,249 in March, 1887. Total debt more than £25,000,000 was incurred for railroad construction.

The colony was a penal settlement before 1828, and in 1828 nearly half of the total population of 36,598 were transported felons. When the last decennial census was taken in 1886, the population was 751,468, comprising 340,319 males and 340,319 females. The increase in the ten years had been at the rate of 4.9 per annum. In the six years ending 1886 the net immigration averaged 30,000 persons; the number of immigrants in that year was 38,887; of emigrants, 41,896. The number of deaths in 1886 was 36,284, and of deaths, showing a natural increment of 21,697. The birth-rate in 1887 was 18.15 per 1,000. The colony had an estimated population of 751,468 at the end of 1886. The population of the colony on Jan. 1, 1888, was estimated at 1,042,917.

Exports in 1886 amounted to £15,556, which sum £12,884,200 represent the value of domestic produce, including specie.

The value of imports was £20,973,548. Exports of gold and coin were £1,873,235, exports, £1,592,340. The export of wool to Great Britain was 134,929,740 pounds, £5,259,309, the exports of these products being valued at £7,201,976. The most important exports were coal, of £947,002, and tin, of the value of £247,002, after which came sheep, silver, cats, skins, and copper. The number of the colony on Jan. 1, 1887, was 39,376. The gold product in 1886 was £355,000. The number of factories in the colony in 1886, employing 45,783 operatives. The policies of New South Wales, which import duties, and Victoria, which a high protective tariff, are often to illustrate the advantages of free trade without taking into consideration the area and natural resources of the colony. The manufacturing interests are nearly equal in the colonies. Victoria excels in boot and shoe manufactures, flour-mills, and iron and steel manufactures, but in many branches New South Wales has the advantage. The number of the factories in the latter colony was 20,160 for Victoria; the value of the plant, £5,002,000 against £4,654,000.

xxviii.—5 A

000. Woolen-mills are not profitable in either colony, and recently the Victorian Parliament has added 5 per cent. to the duty on woollens, which was before 15 to 20 per cent.

There were 1,890 miles of railway in operation in 1886, which had been built at a total cost of £24,962,972. The earnings for the year were £2,160,070, and the expenses, £1,492,992. The telegraphs had 20,797 miles of wire, constructed at a cost of £666,028.

Rich silver-mines have been discovered near the border of South Australia in a district called Broken Hills. The ore-deposits extend over more than twenty miles, and many companies have been formed and mines opened. The report of a week's run of the principal mine in March, 1888, showed 1,709 tons of ore treated, and 73,659 ounces of silver extracted.

Victoria.—The Constitution was granted in 1854. Unlike New South Wales, which enjoys universal suffrage, Victoria limits the privilege of voting by a property qualification. The Governor is Sir Henry Brougham Loch, who was appointed on April 10, 1884. Sir William Foster Stawell was appointed Lieutenant-Governor on Nov. 6, 1886, and in the event of the death or absence from the colony of the Governor will assume the administration of the Government. The Cabinet is made up as follows: Premier, Minister of Mines, and Minister of Railways, Duncan Gillies; Chief Secretary and Commissioner of Water-Supply, Alfred Deakin; Attorney-General, H. J. Wrixon; Commissioner of Public Works, J. Nimmo; Minister of Justice, Henry Cuthbert; Commissioner of Trade and Customs, W. F. Walker; Commissioner of Crown Lands and Survey, J. L. Dow; Minister of Public Instruction, Charles H. Pearson; Minister of Defense, Sir James Lorimer; Postmaster-General, F. T. Derham; Ministers having portfolios with no offices attached, James Bell and D. M. Davies.

The public revenue for the year that ended June 30, 1887, was £6,783,867; the expenditure, £6,665,863. The yield of customs duties was £2,132,361; the income from railways, £2,453,845; from posts and telegraphs, £418,295; from crown lands, £587,100. The interest and expenses of the debt absorbed £1,272,591 of the total expenditure; the working expenses of the railroads were £1,864,400, of other public works £887,827, and of the postal and telegraph service £578,451; the cost of public instruction, £870,856. The revenue for the fiscal year 1887-'88 is estimated at £7,444,000, and the revenue £6,906,000. The public debt in June, 1887, amounted to £33,119,164, of which £25,404,847 were raised to build railroads, £5,004,791 for irrigation works, £1,105,557 for school-buildings, and £1,603,969 for other public works. Interest is at the average rate of 4½ per cent.

The estimated population on Jan. 1, 1888, was 1,036,118, having increased from 862,346 in 1881. The number of births in 1886 was 30,824; deaths, 14,952; marriages, 7,737. The

death-rate in 1887 was 15·70 per 1,000. The excess of births over deaths in that year was only 6·4 per cent. Immigration has declined since the withdrawal of the aid given by the colony before 1874. In 1886 there arrived by sea 93,404 persons, against 76,976 in 1885, and departed 68,102, against 61,994. About half of the population live in towns. The capital, Melbourne, contained 390,000 inhabitants in 1887.

The imports in 1886 were £18,530,575, which was about the average value for five years; but the exports fell off from £15,551,758 in 1885 to £11,795,321 in 1886. The imports of wool amounted to £2,331,599, and the exports to £4,999,662; imports of timber, £1,170,539; of woollens, 892,868; of cottons, £1,027,674. The exports of gold were £1,954,326. The quantity of wool shipped to Great Britain was 93,889,887 pounds.

The state railroads in June, 1887, had a total length of 1,880 miles, besides 316 miles in course of construction. The cost of the lines was £26,479,206. The receipts in the year 1886-'87 were £2,453,087; the expenses, £1,427,116. There were 4,094 miles of telegraph lines, with 10,111 miles of wire at the close of 1886.

South Australia.—According to a law that went into force in 1881 the Legislative Council consists of twenty-four members, of whom eight retire every three years, and are replaced by new members, two from each of the four districts, who are voted for on one ticket by the whole colony. The House of Assembly numbers fifty-one members, who are chosen by universal suffrage.

The Governor is Sir William F. C. Robinson, who was appointed in February, 1883. The heads of the six ministerial departments are as follow: Premier and Treasurer, Thomas Playford; Chief Secretary, James Gordon Ramsay; Attorney-General, Charles Camden Kingston; Commissioner of Crown Lands, Jenkins Coles; Commissioner of Public Works, Alfred Catt; Minister of Education, Joseph Colin Francis Johnson.

The revenue in 1887 was £1,869,942; the expenditure, £2,165,245. The public debt, all of which was raised for public works, amounted, on Dec. 31, 1887, to £19,168,500.

The population on Dec. 31, 1886, was estimated at 312,758, comprising 162,980 males and 149,778 females. The number of births registered in 1886 was 11,177; deaths, 4,234; marriages, 1,976. The number of immigrants was 17,623; of emigrants, 25,231. At the end of 1887 the population was computed at 312,421, showing a loss of 337. The population of the Northern Territory is not included in these estimates. The death-rate in 1887 was 12·62 per 1,000.

The value of imports in 1886 was £4,852,750; of exports, £4,489,008. The exports of wool were valued at £1,955,207; of wheat and flour, £626,610; of copper and copper-ore, £230,868.

The mileage of railways in December, 1886, was 1,381. There were 417 miles in progress. The length of telegraph lines was 5,459 miles; the length of wires, 10,310 miles.

Queensland.—The Constitution dates from 1859, when the colony was separated from New South Wales. The members of the upper house are nominated for life; those of the popular branch are elected by restricted suffrage. The Governor, Sir Anthony Musgrave, was appointed in April, 1883. The composition of the ministry is as follows: Premier, Chief Secretary, and Vice-President of the Executive Council, Sir Samuel Walker Griffith, who is also Colonial Treasurer; Postmaster-General, Walter Horatio Wilson; Attorney-General, Arthur Rutledge; Secretary for Mines and Public Works, William Oswald Hodgkinson; Colonial Secretary and Secretary for Public Instruction, Berkeley Basil Moreton; Secretary for Public Lands, Henry Jordan; without portfolio, Sir James Francis Garrick.

On May 1, 1886, the colony contained 322,853 inhabitants, of whom 190,344 were males and 132,509 females. There were 10,500 Chinese and 10,165 Polynesians in the total, which does not include the aborigines, numbering about 12,000. The increase since the census of 1881 was 109,328, equal to 51·20 per cent. The estimated population on June 30, 1887, was 354,596. According to the census of 1886, 55,890 persons were engaged in agriculture, 51,489 in industries, 7,040 in professional pursuits, 19,790 in commerce, and 171,163 were wives, children, and domestic servants. The number of births in 1886 was 12,582; deaths, 5,575; marriages, 2,785. The population of Queensland on Jan. 1, 1888, was computed to be 366,940. The death-rate for 1887 was 14·56 per 1,000. The average density of population in 1884 was 0·478 per square mile, that in the northern division of 255,400 square miles being 0·24, in the central division of 228,341 square miles 0·17, and in the southern division of 189,751 square miles 1·16. The northern division contained 52,389 inhabitants, the central, 38,821, and the southern, 221,693.

The total value of imports in 1886 was £6,103,227; the value of exports, £4,933,970, of which sum £1,413,908 represent wool, and £855,510 sugar. Other exported products, besides gold, are hides, tin, preserved meat, silver-ore, and pearl-shell. There were 54,010 acres under sugar-cane in 1886, and of this area 34,657 acres yielded 58,545 tons of sugar valued at £1,125,284.

At the end of 1886 there were 1,555 miles of railway completed and 637 miles under construction. Their capital cost was £10,716,352; the receipts in 1886 were £640,845, and the running expenses £476,966.

The length of telegraph lines was 8,225 miles, with 14,443 miles of wire.

Western Australia.—The Government is administered by a Governor assisted by a Legis-

lative Council, one third of its members being appointees of the Crown. The present Governor is Sir Frederick Napier Broome, who has held the post since December, 1882. The revenue in 1886 was £388,564, and the expenditure, £394,675. The revenue for 1887 was estimated at £404,190 and the expenditure at £478,189.

The population is growing rapidly by immigration. The number of inhabitants, exclusive of aborigines, was estimated at 89,584 at the end of 1886. There were 2,846 natives in service with colonists in 1881. The number of births in 1885 was 1,466; of deaths, 806. During that year 5,615 persons arrived in the colony, and 1,877 departed. On Jan. 1, 1888, there was a population of 142,488 in the colony, according to official statistics. The rate of deaths during the previous year had been 17·11 per 1,000.

The imports in 1886 were valued at £758,012; the exports at £680,398. The chief exports are wool and lead ore. There were 202 miles of railroad in operation at the end of 1886 and 299 miles were building. The telegraph lines of the colony had a total length of 2,405 miles.

Tasmania.—The Constitution was first adopted in 1871, and amended in 1885. The Parliament consists of a Legislative Council of 18 members, elected by land-owners and the educated classes, and a House of Assembly of double that number, elected under a property qualification. The Governor is Sir Robert G. O. Hamilton, who was appointed in January, 1887. The Cabinet is composed of the following ministers: Premier and Chief Secretary, Philip Oakley Fysh; Treasurer, Bolton Stafford Bird; Attorney-General, Andrew Inglis Clark; Minister of Lands and Works, Edward Nicholas Coventry Braddon.

The area of Tasmania, which was formerly known as Van Diemen's Land, is 26,215 square miles, and the estimated population in December, 1886, was 187,211. The aborigines are entirely extinct. The number of births in 1886 was 4,627; deaths, 1,976; marriages, 985. There were 16,899 immigrants and 14,680 emigrants. On Jan. 1, 1888, the island contained 142,478 inhabitants. The deaths registered in 1887 were at the rate of 15·45 per 1,000.

The imports in 1886 were valued at £1,756,567 and the exports at £1,881,540. The chief articles of export are tin, wool, preserved and fresh fruits, gold, timber, hides, and bark.

The railroad mileage in 1886 was 308, while 138 miles were in course of construction in 1887. There were 1,772 miles of telegraph lines and 2,358 of wire at the end of 1886.

Fiji.—British sovereignty was proclaimed on Oct. 10, 1874. The colony is administered as a Crown dependency by a Governor who is also High Commissioner for the Western Pacific. The present Governor is Sir John Bates Thurston. Fourteen of the sixteen provinces are ruled

by native chiefs. The colony consists of a group of islands, of which there are eighty that are inhabited, the largest being Viti Levu, with an area of 4,250 square miles, and the next largest Vanua Levu, which is 2,600 square miles in extent. The island of Rotumah was annexed in December, 1880. The native Fijians are Methodists in religion, except one twelfth who are Roman Catholics. The population of the colony in 1886 was 124,742, and consisted of 2,105 Europeans, 882 half-castes; 6,146 Indian coolies; 3,075 Polynesian indentured laborers; 110,087 Fijians, 2,321 natives of Rotumah, and 226 others. Among the Fijians there were 3,991 births and 4,908 deaths in 1886, and among Europeans, 77 births and 45 deaths.

The revenue in 1886 was £64,574 and the expenditure £78,183. The imports amounted to £230,629 and the exports to £283,496. The chief commercial products are sugar, copra, and bananas. The yield of sugar in 1886 was 11,716 tons grown on 10,548 acres, while 18,128 acres are devoted to cocoanuts.

AUSTRIA-HUNGARY, a dual monarchy in central Europe, composed of the empire of Austria, often called Austria proper, and otherwise known as the Cisleithan Monarchy, and the Kingdom of Hungary, called sometimes the Transleithan Monarchy, as the river Leis divides the two territories, and sometimes the dominions of the crown of St. Stephen. Austria is composed of numerous semi-autonomous states, and the provinces of Croatia and Slavonia, which form an integral part of the Hungarian Monarchy, possess in common a separate diet. The two monarchies alike owe allegiance to the House of Hapsburg, the head of which is Emperor of Austria and King of Hungary. They have a common army, with separate militia systems for the defense of their own borders, a single navy, and also a common diplomatic service, and they are united further in a customs union. The common ministry which looks after affairs of imperial concern is responsible to delegations from the two parliaments, which meet annually in separate halls, discussing all questions apart, but voting as one body in case of disagreement. Each delegation consists of 60 members, of whom 20 are chosen from the upper and 40 from the lower house of the respective legislatures.

The reigning monarch is Josef I, born Aug. 18, 1830, who was proclaimed Emperor of Austria on Dec. 2, 1848, and crowned King of Hungary on June 8, 1867, after the ancient Constitution was restored. The Crown-Prince is the Archduke Rudolf, born Aug. 21, 1858.

The Ministry of Foreign Affairs for the whole monarchy has been directed by Count G. Kálnoky de Köröspatak since Nov. 21, 1881. Lieutenant Field-Marshal Count Bylandt-Rheydt, who had been Minister of War since June 21, 1876, resigned on account of illness in March, 1888, and was succeeded by General Baron Bauer, previously commander of the Vienna corps. The Common Minister of Fi-

nance is Benjamin de Kállaky, who was appointed on June 4, 1882.

Area and Population.—The population of the Austro-Hungarian Empire on Dec. 31, 1886, was estimated to be 89,640,884. The population of Austria proper was 23,070,688, and that of Hungary 16,570,146. In Austria there were 11,188,462 males and 11,882,226 females in 1885; in Hungary at the time of the census of 1880 the males numbered 7,702,810 and the females 7,939,192.

The number of births in Austria proper in 1886 was 876,063; deaths, 678,458; marriages, 180,191; excess of births over deaths, 197,605. The births in Hungary in 1885 numbered 787,110; deaths, 522,650; marriages, 165,169; excess of births over deaths, 214,460. Vienna contained in 1887, with its suburbs, 1,270,000 inhabitants, while Buda-Pesth, the capital of Hungary, had in 1886 a population of 422,557. That of Prague, the chief city of Bohemia, had at the last census 162,823; the sea-port Trieste, 144,844; Lemberg, 109,746.

The Occupied Provinces.—The area and the population in 1885 of the Turkish provinces of Bosnia and Herzegovina, the area of Novi-Bazar, which the Congress of Berlin likewise gave over to the military occupation of Austria-Hungary, though the civil administration was reserved for Turkey, and its population according to the enumeration of 1879, are shown in the following table:

PROVINCES.	Area in square miles.	Population.
Bosnia	16,200	187,574
Herzegovina	3,540	1,148,517
Novi-Bazar	8,522	168,000
Total	28,262	1,504,091

Of the inhabitants of Bosnia and Herzegovina 492,710 are Musselman, 571,250 Orthodox Greeks, 265,788 Roman Catholics, and 5,805 Jews. There has been an increase of about 44,000 in the Mohammedan population since 1879. The Austrian military organization and obligatory service has, with some modifications, been extended to Bosnia and Herzegovina.

Commerce.—The total value of the exports of Austria-Hungary in 1886 was 698,632,273 florins, against 672,083,194 florins in 1885. The value of the imports in 1885 was 557,948,324 florins. The value of grain, pulse, and flour exported in 1886 was 95,445,185 florins; timber, 57,570,588 florins; sugar, 49,119,976 florins; instruments, watches, etc., 48,311,398 florins; wool and woollen manufactures, 47,361,901 florins; live animals, 47,277,808 florins; animal products, 33,799,970 florins; beverages, 29,284,292 florins; fruit, nuts, hops, etc., 25,657,334 florins; leather and leather manufactures, 25,127,130 florins; glass and glass-ware, 19,446,478 florins; fuel, 19,324,155 florins; flax, hemp, and other fibers, 19,127,006 florins; wood and bone manufactures, 18,186,692 florins; cotton manufactures, 15,-

184,411 florins; minerals, 12,889,295 florins; paper and paper manufactures, 11,914,262 florins; iron and iron manufactures, 10,546,811 florins; tobacco, 7,625,530 florins.

The value of the precious metals exported in 1886 was 1,797,057 florins, while the imports were 12,282,529 florins.

The following table exhibits the movement of imports in 1885, and of exports in 1886 across the frontiers of contiguous countries and by sea-ports:

COUNTRIES.	Imports.	Exports.
Germany	837,495,617	897,282,570
Trieste	87,881,560	99,769,181
Roumania	40,047,638	84,370,591
Flume and other ports	31,748,194	45,672,479
Russia	21,890,116	20,549,044
Italy	19,176,409	42,494,557
Serbia	14,162,174	18,378,699
Switzerland	5,477,870	39,436,418
Montenegro	285,004	72,425
Turkey	284,312	687,314
Total	557,948,324	698,632,273

In Austria the area sown to wheat in 1885 was 1,194,059 hectares, yielding 17,015,680 hectolitres; 2,000,971 hectares were under rye, producing 27,984,480 hectolitres; 1,166,416 hectares under barley, producing 18,844,870 hectolitres; 1,829,047 hectares under oats; producing 33,889,650 hectolitres; 367,657 hectares under corn, producing 7,008,060 hectolitres. Vineyards covered 228,949 hectares. There is a considerable export of wine and barley, and in some years of wheat.

The agricultural returns of Hungary for 1886 give 4,070,360 hectares as the area devoted to wheat and rye, and the yield as 51,850,560 hectolitres. The crop of barley on 1,044,219 hectares was 13,343,882 hectolitres. Corn was cultivated on 1,914,159 hectares, and the crop amounted to 29,767,527 hectolitres. Vineyards covered 363,562 hectares, and the value of the wine produced was 40,691,000 florins. There are large exports of horses, cattle, and sheep from both Austria and Hungary.

Railroads.—The railroads of Austria had a total length of 13,618 kilometres or 8,512 miles on Jan. 1, 1887. There were 8,596 kilometres of state lines, besides 84 kilometres that are worked by companies, 1,590 kilometres belonging to companies that are worked by the Government, and 8,348 kilometres owned and operated by private corporations. Hungary had 9,352 kilometres or 5,843 miles, making the total mileage for the empire 14,855. The state lines in Hungary had a total length of 4,243 kilometres and the lines of companies were 5,109 kilometres in length, including 402 kilometres that were operated in connection with the Government railroads.

The Post-Office.—The number of letters and postal cards carried in the Austrian mails in 1886 was 408,475,000; patterns and printed matter, 56,337,000; newspapers, 90,112,800. The receipts amounted to 26,367,103 florins, and the expenses to 22,619,102 florins.

The number of letters that passed through the Hungarian post-office in 1885 was 117,953,000, inclusive of post-cards; patterns and printed inclosures, 17,756,000; newspapers, 47,081,000. The receipts were 10,281,768 florins, and the expenses 8,543,492 florins.

Telegraphs.—Austria had 24,442 miles of line and 64,050 miles of wire in 1886, and Hungary 11,215 miles of line and 41,520 miles of wire. There were 2,000 miles of line in Bosnia and Herzegovina. The number of messages transmitted by the Austrian telegraphs in 1885 was 6,701,899. In Hungary 6,009,596 messages were dispatched in 1886.

Navigation.—The number of vessels entered at the port of Trieste in 1885 was 6,971, of 1,267,946 tons; cleared, 6,932, of 1,264,051 tons. The number entered at all Austro-Hungarian ports was 68,681, of 7,705,202 tons; the number cleared was 68,502, of 7,697,560 tons. Of the vessels 80 per cent. and of the tonnage 87 per cent. were Austrian. The mercantile marine consisted in 1886 of 61 ocean steamers, of 69,452 tons, 82 coasting steamers, of 14,491 tons, and 9,225 sailing-vessels of all kinds, of 228,044 tons.

The Army.—The active army and its reserve are under the control of the Imperial authorities, whereas the Landwehr and the Landsturm that has been recently organized under the law of 1886 are controlled by the ministry of national defense of each monarchy. The legal period of military service for every able-bodied man in the empire, except those who are exempt on account of family conditions, is three years with the colors, though the actual term is usually much shorter. The annual recruit is about 84,000 men. After completing the period of active service at twenty-three, they are liable for service in the reserves till the age of thirty, and then pass into the Landwehr for two years, and after that are enrolled in the Landsturm for ten years longer.

The standing army in 1887 numbered 267,179 men. Its war strength was 805,904. The Austrian Landwehr numbered 152,632 men; the Hungarian Honved, 167,369; the Austrian Landsturm, 228,876; the Hungarian Landsturm, 212,246; the gendarmerie, 6,164; making the total military strength of the empire 1,573,191 men, exclusive of officers, who number 17,867 in time of peace, and 32,785 in war. The number of horses is 50,362 in peace, and 211,462 in war; the number of field-guns, 816 in peace, and 1,748 in war.

One full corps was armed with the new repeating rifle by the beginning of 1888, and in January the reservists were called out to be drilled in its use.

The Navy.—The iron-clad navy in 1887 consisted of 12 vessels. There were in process of construction the "Kronprinz Erzherzog Rudolf," a barbette turret-ship, 12 inches of armor, and the "Stephanie," a barbette belted ship of 5,100 tons, with 9-inch plates, and engines of from 8,000 to 11,000 horse-power.

There were 10 unarmored cruisers, 2 classed as frigates and 8 as corvettes, 6 torpedo-vessels, 16 coast-guards, 2 river monitors, and 88 torpedo-boats.

Common Finances.—The expenditure for the whole monarchy in 1887 was 128,855,414 florins, as compared with 119,724,748 florins in 1886. The budget estimates for 1888 make the expenditure for the common affairs of the monarchy 184,480,397 florins, of which 41,510,397 florins are covered by the surplus revenue from customs and 90,149,426 florins are the contributions from the Austrian and Hungarian treasuries, the remainder being the receipts of the various ministries. The expenditure of the ministry of Foreign Affairs is estimated at 3,859,100 florins; expenditure on the army, 117,162,360 florins, of which 18,619,775 florins are for extraordinary purposes; expenditure on the navy, 11,328,224 florins, including 2,145,147 florins of extraordinary expenditure; expenses of the Board of Control, 129,153 florins.

For the administration of the occupied provinces of Bosnia and Herzegovina in 1888 the expenditure was estimated at 9,076,218 florins, and the revenue at 9,147,189 florins. The cost of the army of occupation is placed at 4,424,000 florins.

The Triple Alliance.—The defensive alliance between Austria and Germany was negotiated at Gastein and Vienna after the Berlin Congress by Prince Bismarck in consequence of the unfriendly attitude of Russia. Italy subsequently joined the league, and after its renewal in February, 1887, on the arrangement of details at the interviews between Prince Bismarck and Count Kálmoky and Signor Crispien at Friedrichsruh in September, the terms of the original Austro-German treaty of alliance were for the first time published to the world. The new treaty, except in minor particulars in respect to the military forces to be maintained and the conditions of mobilization, is officially declared to be identical with the other. The agreement is generally understood to be that if either Austria or Germany, without being the aggressor, is attacked by Russia, the combined military forces of the two empires will move against that power; if France should attack either Germany or Italy, she would be opposed by both those powers acting in common; and if France and Russia should combine to assail one or more of the allied powers, the entire military and naval strength of the league would be called into immediate action. The original treaty between the two emperors contained three clauses. The first binds each power to assist the other with its entire military power in case either should be attacked by Russia, the second engages each to observe an attitude of benevolent neutrality if its ally should be attacked by a power other than Russia, but to co-operate with its full military strength and only conclude a peace in common if Russia

should join the attacking power either by active aggressions or by military measures involving menace. The third clause provides that the treaty should be kept secret, and only be communicated to a third power by mutual agreement, and contains an agreement that the Emperor Alexander should be informed, in case the Russian armaments assumed a menacing character, that an attack against one would be considered as directed against both.

The animosity of the Russian press against the Germans was rekindled by the publication of the part of the treaty that was directed against Russia. The Russian Government had been informed of the terms of the alliance some time before. The movement of Russian cavalry and other troops toward the German and Austrian frontiers had already begun, and there was a general expectation that war would break out in the spring. The Austrian delegations voted a large credit, and the cantonments of troops on the Galician border were soon more than equal to the Russian force, except in cavalry. The fortresses were strengthened, and 200,000 huts were built to quarter the soldiers along the frontier.

The coolness existing in the latter part of 1887 between Russia and Germany, and the menacing concentration of Russian troops on the Polish frontiers, were partly the result of an intrigue which was attributed, but not actually traced, to Orleanists, who desired to embroil Germany and France, and nearly succeeded in their purpose. The Czar came into possession of a letter of the date of Aug. 27, 1887, bearing the supposed signature of Prince Ferdinand of Bulgaria, addressed to the Countess of Flanders, and imploring her to induce her brother, the King of Roumania, and the King of the Belgians to use their influence, the one with the Czar and the other at the Austrian court, on his behalf. He would not, it is said in the letter, have accepted the Bulgarian throne except for the secret encouragement of Germany, and as a proof of this a document was inclosed under the same cover which was in the hand-writing of Prince Reuss, the German ambassador at Vienna, but unsigned. This conveyed assurances that if the Prince should decide to take possession of the throne of Bulgaria, Germany was not in the position at the moment to lend any official aid or encouragement, but that, however hostile the political acts of the German Government might appear, the time would come when it would reveal its secret sentiments and extend its open support. In a second letter to the Countess of Flanders complaint is made of the changed attitude of Germany, but in a third the Prince is made to say that, subsequent to the meetings at Friedrichsruh with Kálnoky and Crispi, Prince Bismarck had given him renewed assurances. The misunderstanding occasioned by this correspondence was dispelled when the Czar passed through Berlin in November, 1887, and stopped to pay his respects to his uncle,

the Emperor Wilhelm, after having declined a ceremonious interview at Stettin in September. Being brought face to face with the German Chancellor, he openly charged him with duplicity in encouraging Ferdinand's course secretly while officially condemning it as a contravention of the treaty of Berlin. Bismarck declared the communication purporting to have come from Prince Reuss to be a forgery, and on inquiry it turned out that the entire correspondence was fictitious. The concentration of Russian troops did not immediately cease after the exposure of the forged documents, but there was soon an abatement of activity, first on the part of Russia, and then on the part of Austria, so that the Government did not deem it necessary to call the delegations together to ask of them an additional credit. The assurance of the Czar that the military movements had no aggressive purpose did more than anything else to quiet the war alarm. Prince Bismarck, in a speech in the Reichstag, on the German army bill, delivered February 6, spoke of the fears that had arisen during the past year as having more reference to Russia than to France, and reviewed the situation and the relations between Germany and Russia. He expressed no fear on account of the massing of Russian troops on the German and Austrian frontiers, which he explained by saying, "I conclude that the Russian Cabinet has arrived at the conviction, which is probably well founded, that in the next European crisis that may take place, the weight of Russia's voice in the diplomatic Areopagus of Europe will be the heavier the further Russia has moved her troops toward the western frontier."

M. Tisza, in answer to an interpellation, said, on January 28, that Russia, in pursuance of a plan of military reorganization, had effected a large displacement of troops toward the Austrian frontier, which compelled Austria-Hungary to take measures for her protection.

Austria.—The present Austrian Cabinet, which was first constituted on Aug. 19, 1879, is composed of the following ministers: Minister of the Interior, Count Edward Taaffe; Minister of Public Instruction and Ecclesiastical Affairs, Dr. Paul Gautsch von Frankenthurn, appointed Nov. 6, 1885; Minister of Finance, Dr. J. Dunajewski; Minister of Agriculture, Count Julius Falkenhayn; Minister of Commerce and National Economy, Marquis von Bacquehem, appointed July 28, 1886; Minister of Landesvertheidigung, or National Defense, Major-General Count S. von Welsersheimb; Minister of Justice, A. Prazak; without portfolio, F. Ziemiakowski.

The Reichsrath is composed of a House of Lords, consisting of hereditary peers, princes of the Church, and life-members, and an Elective Chamber, consisting at present of 353 deputies, representing towns, chambers of commerce and industry, and rural districts. The consent of the Reichsrath is necessary for all

laws relating to military duty, and its co-operation in legislation relating to trade and commerce, customs, banking, the post-office, telegraphs and railways; while estimates of revenue and expenditure, tax-bills, loans, the conversion of the debt and its general control, must be submitted to parliamentary examination.

Revenue and Expenditure.—The accounts of the Austrian Treasury are not made public till after the lapse of several years. There has been for the past four years a large excess of expenditure over receipts shown in the annual budgets. The budget of expenditures was reduced from 542,955,540 florins in 1884-'85, to 516,625,771 florins in 1886-'87, but it mounts up again in the estimates for the year ending March 31, 1888, to 537,221,802 florins. The increase is mainly in extraordinary expenditure, which is 64,580,756 florins, of which, however, 21,830,100 florins extend over two years. The ordinary expenditures amount to 472,641,047 florins, the principal items being 125,517,331 florins for the interest and sinking fund of the public debt, 97,434,672 florins for financial administration, 89,215,805 florins for common affairs, 58,412,692 florins on account of the Ministry of Commerce, 19,832,000 florins for the administration of the Department of Justice, 16,547,104 florins for pensions and grants, 16,197,491 florins on account of the Ministry of the Interior, 11,820,898 florins for education, 11,729,712 florins on account of the Ministry of Agriculture, and 10,198,996 for defense.

The total revenue is estimated at 509,546,594 florins, of which 492,417,488 are derived from ordinary sources and 17,129,156 florins are extraordinary revenue. The income from direct taxes on land, houses, incomes, etc., amounts to 99,068,000 florins. The amount raised by indirect taxation is 308,721,814 florins, customs producing 43,124,414 florins, excise 87,507,400 florins, the salt-tax 20,447,000 florins, stamps 18,200,000 florins, the tobacco-tax 75,750,000 florins, judicial fees, 33,250,000 florins, the state lottery 21,500,000 florins, and other taxes 3,943,000 florins. The receipts from posts and telegraphs are taken as 27,682,270 florins, those from railways as 40,056,317 florins. Mines yield an income of 6,552,472 florins, forests and domains 4,179,550 florins, and state property 2,140,760 florins.

The total debt, not reckoning 412,000,000 florins of paper money, amounts to 3,537,885,156 florins. The special debt of Austria amounts to 767,184,511 florins, and the general debt of the empire to 2,770,700,645 florins, the main burden of which falls on Austria, as Hungary pays only something over 30,000,000 florins, of the interest on the general consolidated debt, the interest charge being 139,635,516 florins.

Hungary.—Coloman Tisza de Boros-Jenő has been President of the Hungarian Council of Ministers since Nov. 25, 1879. The heads of the departments are as follow: Ministry of Finance, Coleman Tisza *ad interim*; Ministry of the Honved or National Defense, Baron Géza

Fejérváry; Ministry near the King's Person, Baron Béla Orezy; Ministry of the Interior, Baron Béla Orezy *ad interim*; Ministry of Education and Public Worship, Dr. August Trefort; Ministry of Justice, Theophile Fabiny, appointed May 17, 1886; Ministry of Communications and Public Works, Gabriel de Baross, appointed Dec. 21, 1886; Ministry of Agriculture, Commerce, and Industry, Count Paul Scéchényi; Ministry for Croatia and Slavonia, Coloman de Bedekovich.

The Hungarian Parliament consists of the House of Magnates and the House of Representatives. The former was reformed in 1885, and now comprises 51 ecclesiastical representatives, 50 life-peers, 16 state dignitaries and judges who have seats by virtue of their offices, 20 archdukes, and 286 hereditary peers. The representatives in the lower house are not chosen by separate classes and voted for indirectly, as in Austria, but are elected by the direct vote of all male citizens over twenty years of age who are possessed of a low property qualification or belong to the educated class.

Revenue and Expenditure.—The Hungarian budgets uniformly present a deficit, and in some years the expenditures very largely exceed the revenue. The receipts of the treasury for 1888 are estimated at 826,641,987 florins, the ordinary receipts being 319,899,999 florins, and the transitory revenue 6,741,988 florins. About one fourth of the revenue is derived from direct taxes on land, buildings, and incomes, and one fourth from excise and customs duties and monopolies.

The total expenditure for 1888 is estimated at 845,037,108 florins, of which 321,072,608 florins constitute the ordinary expenditures of the Government, 2,267,426 florins are transitory expenditures, 13,771,079 florins are investments, and 7,925,995 florins are extraordinary common expenditures. The ordinary expenditures under the chief heads are as follow: National debt, 115,599,408 florins; Ministry of Finance, 56,594,489 florins; state railways, 26,463,380 florins; quota of ordinary common expenditures, 21,770,061 florins; Ministry of Communications and Public Works, 14,249,038 florins; Ministry of Justice, 11,972,024 florins; debts of guaranteed railroads taken over by the state, 11,724,285 florins; Ministry of the Interior, 11,440,926 florins; Ministry of Agriculture, Industry, and Commerce, 10,897,823 florins; Ministry of National Defense, 8,484,547 florins; Ministry of Instruction and Worship, 6,591,340 florins; administration of Croatia, 6,054,134 florins; pensions, 5,314,701 florins.

The annual deficits since 1867 have accumulated into a debt that is nearly double the special debt of Austria. It amounted in 1886 to 1,342,380,381 florins, while Hungary's share of the common debt was 248,000,000 florins more, the total charge absorbing 37 per cent. of the revenue. The excessive expenditures have been caused by the construction of railroads faster than the traffic warranted.

B

BALANCE OF POWER. In the modern European acceptance of the term, the balance of power is a mutual understanding among sovereign states that no one state may interfere with the independence of any other state. In this may perhaps be found the germ of that congress of nations to which many thoughtful minds look forward as the ultimate arbiter that shall render possible the disarmament of Europe. Neither the phrase itself nor the idea from which it springs, is of recent origin. The small states of ancient Greece combined first against the threatening domination of Athens and afterward against that of Sparta. More recently Europe, with show of systematic organization, combined to resist the aggressions of Spain, then against France, and still more recently against Russia. Most of the wars resulting from these combinations have probably tended to the establishment of international law and to the advancement of human liberty. Upon the whole, while the balance of power has perpetuated in Europe some of the relics of mediæval barbarism, it has tended to preserve a certain international equilibrium, which has probably prevented many wars, and has certainly preserved the autonomy of many of the lesser powers.

Conspicuous among the advocates of the balance of power is the Chevalier Friedrich Von Gentz (1764-1832). As head secretary at the Congress of Vienna and at the Conference of Ministers at Paris in 1815, he had abundant opportunities to study the opinions of leading European diplomatists. In 1806, while Europe was well-nigh subjugated by Napoleon, he published "Fragments upon the Balance of Power in Europe." He defines the term as "a constitution subsisting between neighboring states more or less connected with one another, by virtue of which no one among them can injure the independence or essential rights of another, without meeting with effectual resistance on some side, and consequently exposing itself to danger." His fundamental propositions are: 1. No state must ever become so powerful as to coerce all the rest; 2. Every state that infringes the conditions is liable to be coerced by the others; 3. The fear of coercion should keep all within the bounds of moderation; 4. A state that attains a degree of power adequate to defy the union should be treated as a common enemy.

Ferdinand III, Emperor of Germany is believed to have conceived the idea of a European Congress in 1640, with a view to terminating the Thirty Years' War and reconciling the hostile interests of church and state. After protracted negotiations the Congress of Münster or Westphalia assembled (July, 1643), the Catholics and Protestants being represented by

their respective delegates, while France, Sweden, Venice, and the Pope were represented as mediators by ambassadors. The negotiations extended over a period of five years, for it was not until October, 1648, that the treaty was signed. It is remarkable that such apparently hopeless differences could be reconciled at all, but the Treaty of Westphalia proved to be for Europe almost what Magna Charta was to England. It was in effect the first official recognition of interdependent rights among rival European interests. In other words, it inaugurated a balance of power. France and Sweden were appointed mediators, with the right of intervention in case of need to uphold the provisions of the treaty, and the hostile religious sects within the borders of Germany were guaranteed independence, while they were bound over to keep the peace. To Cardinal Mazarin was due the main feature of this compact, and although the unity and autonomy of Germany were injuriously curtailed, and French aggression was proportionately encouraged, the treaty was substantially recognized and enforced down to the time of the French Revolution.

Nevertheless, peace was not secured to Europe by the treaty. The ambitions of Louis XIV led to minor wars of conquest, and finally to a disastrous attempt at the forcible annexation of Spain, with a view to uniting the two kingdoms under Bourbon rule. The crisis had been foreseen, and an attempt was made to preserve the balance of power by an equitable partition of the Spanish dominions. Such an arrangement was not at all to the taste of the aggressive Louis XIV, who, as has indeed been the case with almost all monarchs in all time, did not hesitate to break through such a flimsy barrier as a mere parchment treaty. His attempt to place his grandson upon the Spanish throne revived the question of the balance of power. It was evident that the union of France and Spain would be fatal to the existing schemes of dependence and independence. Among the disastrous consequences anticipated was the restoration of the Stuarts in England and the inevitable ascendancy of the Catholics all over Europe. England, Austria, and Holland, therefore, the three great Protestant powers of the period, with others of the lesser states, formed a coalition against Louis, and the war continued until 1715, when under the Treaty of Utrecht the relations of all the European states were carefully readjusted, Philip V retaining the Spanish crown, and every precaution being taken to prevent a possible union of France and Spain under one sovereign, since such a union would at once destroy the equilibrium. Although these elaborate provisions failed effectually to dis-

sociate the two branches of the house of Bourbon, and although the Treaty of Utrecht was obnoxious to England, the peace of Europe was secured for thirty years.

Until about the beginning of the nineteenth century, Russia was substantially ignored by the European family of states. France, Spain, Sweden, Austria, and Holland, with occasional intervention on the part of Great Britain, had preserved such an equilibrium as seemed good to them, and none of the smaller states had been arbitrarily absorbed by their more powerful neighbors. During these years, Peter and Catherine of Russia had developed the resources of their empire, and Frederick II had raised Prussia from a subordinate to an independent place. Conquests of the great maritime powers had extended colonization to Asia and India. The United States of America had secured independence, and Poland had been forcibly partitioned by Russia, Austria, and Prussia. The partition of Poland (1772) was but the first of a series of events that culminated in the French Revolution. It was the first deliberate and gross violation of the system of treaties based upon that of Westphalia, and with the French Revolution all pretense of preserving the balance of power on its old lines was abandoned. Small states were overpowered and annexed, and Europe saw her ancient boundaries shifted to meet the new conditions.

To thoughtful observers, like the Chevalier Gentz, and to the leading statesmen of the period, including those of Great Britain, the temporary nature of then existing conditions seemed evident. The meteoric career of Napoleon, even when he might almost have written himself the ruler of Europe, did not mislead these master-minds. They steadily held that lasting peace could be regained only through the restoration of national rights, and that this could only be effected by combining against the common enemy. After many discouraging failures, a coalition was at last formed, resulting in the overthrow of Napoleon.

The Congress of Vienna met in November, 1814, and remained in session until June, 1815. Here, for the first time, the most powerful and distinguished of living sovereigns and statesmen met, prepared to make mutual concessions, with a view to a lasting peace. Even France, whose ambition had plunged Europe into prolonged war, was admitted an equal to the council, M. Talleyrand representing her interests. In the then existing condition of European affairs, certain relics of mediævalism survived, and certain provisions that afterward proved insupportable were embodied in the treaty.

The fact that all the contracting parties were more or less dissatisfied with the results of its deliberations, goes far to show that selfish interests were in general overruled. In point of fact, the treaties then signed were ob-

served in the main for the better part of half a century. They survived the revolution of 1848, and though modified in some quarters, and even abrogated in others, they may be said to have survived in many of their main features until the great German wars of 1866 and 1870.

At Vienna, in 1815, the first international constitution was framed, defining the boundaries of European states, all the contracting parties agreeing thereto, guaranteeing the independence of the small principalities and free cities, as well as incorporating in its provisions the Constitution of the German Confederation. Every state in Europe had the right to appeal to the rest in case of infringement, and it seemed, for a time, as though the foundations had been laid for permanent peace. In the course of time several appeals were made to the high contracting parties, and many international disagreements were averted by the wise measures adopted in conferences convened under the provisions of the treaty. Thus was inaugurated the nearest approach to an actual balance of power, and during the long period of general peace that followed, the European world certainly made rapid progress in the direction of universal amity.

But with advancing years, complications were developed; there were wheels within wheels. Such compacts can only be maintained while all parties are measurably satisfied with the working of the system, and the northern powers formed what was known as a Holy Alliance among themselves, otherwise an alliance offensive and defensive, unifying their interests and binding themselves to act together in all emergencies. It was held, and not without reason, that under the Treaty of Vienna, the allied powers could interfere arbitrarily in the internal affairs of states, on the ground that the peace of Europe was endangered thereby. Conferences were held at Aix-la-Chapelle (1818), Carlsbad (1819), and Troppau (1820), and restrictive measures were adopted, which were obnoxious to some of the treaty powers. At Verona, in 1822, the Duke of Wellington, as the representative of Great Britain, declared that his Government could no longer countenance the actions of an alliance that interfered so intimately with the internal affairs of individual states. England preferred isolation to any such tyrannical combination. Thus was inaugurated the principle of non-intervention, on the strength of which England, in 1852, declined to act with Prussia in preventing the Napoleonic restoration in France. On the same ground, England joined France in protesting against the invasion of Schleswig, and opposed alone the annexation to France of Savoy and Nice. The traditions of Vienna were thus gradually ignored, and had become practically a dead letter when, in 1863, Napoleon III proposed a new congress for the readjustment of the balance of power. The proposition was rejected,

largely through the refusal of England to participate.

In spite of the still subsisting guarantees of the powers, Denmark was compelled to surrender her choicest provinces in the Schleswig-Holstein campaign—a federal execution, as it was called, by the German powers, and in 1866 Austria was driven from the confederation in a startlingly energetic incursion by the Prussians. This was the first war of any magnitude undertaken in defiance of possible interference under the compact of Vienna, and the humiliation of France followed as a natural consequence four years later. Taking advantage of the crisis in Western Europe, Russia abrogated the pledges made at the end of the Crimean war, and thus passed away almost the last vestige of the Treaty of Vienna.

At the present time no open alliances can be said to exist among any of the European nations. The balance of power, as it was understood in 1815 and the following years, has disappeared, though its influence is no doubt still indirectly felt. The autonomy of Switzerland and Belgium would probably be defended by a general alliance, should it be seriously threatened, but the main idea of all the great powers at present is to make an efficient soldier of every able-bodied man. To all appearance, the military power of the German Empire far exceeds that of any other single state, a condition of affairs wholly at variance with the principles laid down at Vienna, but against which no power on earth is at present entitled to remonstrate.

That a third step toward permanent peace and possible disarmament will ere long be taken, may probably be counted upon with some degree of confidence, and if the lessons taught by Westphalia and Vienna are permitted to have their due effect, the third general congress may effect still more lasting and beneficial results.

BAPTISTS. The "American Baptist Year-Book" for 1888 gives statistics of the Baptist churches in the United States, of which the following is a summary: Number of associations, 1,281; of ordained ministers, 20,477; of churches, 31,891; of members, 2,917,315; of Sunday-schools, 15,447, with 116,453 officers and teachers, and 1,126,405 pupils; number of additions by baptism during the year, 158,373. Amount of contributions: for salaries and expenses, \$5,849,756; for missions, \$905,673; for miscellaneous purposes, \$1,961,382. Value of church property, \$48,568,686. In all North America, including the United States, Canada, Mexico, the West Indies, etc., are returned 1,305 associations, 32,861 churches, 21,071 ministers, 3,081,845 members, and 165,885 baptisms; in South America (Brazil), 6 churches, 14 ministers, 175 members, and 30 baptisms; in Europe, 80 associations, 3,506 churches, 2,592 ministers, 387,645 members, and 6,013 baptisms; in Asia, 8 associations, 718 churches, 558 ministers, 68,618 members, and 3,287 bap-

tisms; in Africa, 8 associations, 88 churches, 85 ministers, 3,247 members, and 142 baptisms; in Australia, 6 associations, 175 churches, 181 ministers, and 15,189 members; total for the world, 1,402 associations, 37,354 churches, 24,451 ministers, 3,506,719 members, and 175,307 baptisms.

Of the Baptist educational institutions in the United States, seven theological institutions return 48 instructors and 579 pupils; 30 universities and colleges, 255 instructors and 4,012 pupils, of whom 687 were preparing for the ministry; 30 seminaries for the education of young women exclusively, 276 instructors and 3,597 pupils; 42 seminaries and academies for young men and for pupils of both sexes, 232 instructors and 4,125 pupils, of whom 237 were preparing for the ministry; and 19 institutions for the colored race and Indians, 157 instructors and 5,408 pupils, 342 of whom were preparing for the ministry. The total value of the grounds and buildings of these 128 institutions was \$9,118,096; and the amount of their endowments, so far as was reported, was \$8,763,385. Twelve Baptist homes, ministers' homes, and orphanages, with a total valuation of \$553,000 of property, had the care of 626 inmates. Four of them possessed endowments to the amount of \$92,792.

I. American Baptist Societies.—The statistics of the women's Baptist societies for 1887 were as follow: Woman's Baptist Foreign Mission Society (Boston); receipts, \$64,668. The society sustained 29 missionaries and 102 schools, in which 3,428 pupils were enrolled; Woman's Baptist Foreign Missionary Society of the West (Chicago); receipts, \$32,114; missionaries supported, 24; Women's Baptist Home Mission Society (Chicago); receipts \$35,691; missionaries (in the United States and Mexico), including Bible women and helpers, 71. The society sustains a training-school at Chicago, from which 11 pupils had been graduated; Woman's American Baptist Home Mission Society (Boston); receipts, \$23,573. It supports teachers at schools in the United States, Indian Territory, Mexico, and Alaska.

The tenth annual meeting of the Woman's American Baptist Home Missionary Society, the object of which is the education of women and children among the freed people, Indians, and immigrants, was held in Worcester, Mass., in May. The receipts had been \$30,805, and the expenditures \$26,935.

Publication Society.—The sixty-fourth annual meeting of the American Baptist Publication Society was held in Washington, D. C., May 18. The Hon. Samuel Crozer presided. The total receipts of the society for the year in all of its departments had been \$582,491. A reserved fund for the purchase of machinery and enlargement of business had been set aside from the profits of the book department during previous years, which now amounted to \$87,463. The cash receipts in the book department had been \$449,882, and the entire

business done by it, including sales on credit, amounted to \$502,702. One hundred and twelve new publications had been added to the list, and 29,307,797 copies of all publications—books, pamphlets, tracts, and periodicals, new and old—had been printed; of these, 28,115,225 were "graded helps" and papers for Sunday-schools. The receipts in the missionary department, including the balance on hand at the beginning of the year, had been \$105,190. Eighty-seven missionaries had been employed in the United States, two in Germany and Sweden, and five special missionaries—native Armenians—in the Turkish empire. These returned 42 churches constituted, 299 Sunday-schools organized, and 934 persons baptized. The receipts for Bible work had been \$29,439, while \$21,482 had been expended for the purchase of Scriptures and for appropriations of Scriptures for the Missionary Union and the Southern Baptist Convention.

Home Mission Society.—The fifty-sixth annual meeting of the American Baptist Home Mission Society was held in Washington, D. C., May 16. The Hon. C. W. Kingsley presided. The total receipts during the year had been \$351,596. Among the matters of special note which had marked the year's history of the society were mentioned in the report, the completion and occupancy of the mission headquarters in the city of Mexico and the enlargement of the work in that republic; the completion of a subscription of \$15,000 for Chinese mission headquarters in San Francisco, and the purchase of a site on which a building is being erected; the securing of a larger amount than usual for church-edifice work; the appointment of an additional superintendent of missions for a new Western district, and of a district secretary for the Southern States; the beginning of mission work among the Poles and Bohemians in the United States; and the adoption of a new school for Indians in the Indian Territory. Missionary operations had been conducted in 45 States and Territories, and in Ontario, Manitoba, British Columbia, Alaska, and three Mexican states. The whole number of laborers employed had been 743. French missionaries had labored in 6 States; Scandinavian in 16 States and Territories; and German in 18 States and Territories, Ontario, and Manitoba; 161 persons had labored among the foreign population, and 217 missionaries and teachers among the colored people, Indians, and Mexicans; 1,594 churches and out-stations, returning 30,974 members, had been supplied; 2,886 members had been received by baptism; 137 churches had been organized; and 784 Sunday-schools, returning 47,410 attendants, had been under care. In the church-edifice department, 88 churches had been aided by gifts or loans, or both; the aggregate amount of gifts being \$32,787, and of loans, \$20,510. With the aid of these sums, property valued at about \$200,000,000 had been secured to the denomination. Thirty-

three churches had paid off their loans; 232 loans were outstanding; and the whole number of churches aided by gifts and loans had been 931. The amount of the loan fund was \$120,555; and the receipts for the Benevolent Fund had been \$45,805. The schools included 12 incorporated and 6 unincorporated institutions, in which 137 teachers had been engaged and 3,741 pupils enrolled; 17 colored schools returned 115 teachers, 14 of whom were colored, with 2,995 pupils, 318 of whom were studying for the ministry, 980 preparing for teachers, and 86 medical students. Industrial education had been systematically imparted at 8 institutions, and more or less attention given to it at the others. The three schools for the Indians in the Indian Territory returned 232 pupils. The Indian University, near Muscogee, had 86 students enrolled. The third school, a new one for the society, was at Sa-sak-wa, in the Seminole nation. Six schools, with an aggregate enrollment of 250 pupils, were conducted in Mexico.

Missionary Union.—The seventy-fourth annual meeting of the American Baptist Missionary Union was held in Washington, D. C., beginning May 21. The Hon. George A. Pillsbury, of Minnesota, presided. The receipts of the year, from all sources and for all purposes, had been \$411,885; the appropriations for current expenses had been \$390,586; and \$20,550 had been added to annuity funds and permanent accounts. A committee which had been appointed at the previous annual meeting to consider and report upon the advisability of accepting from the Publication Society the Baptist missionary work which had been begun in Turkey reported a unanimous agreement of its members that it could not recommend acceptance. "The claims of other fields, in still more pressing need, and brighter still in promise," it represented, "are more, far more, than enough to employ the utmost resources at the command of the Missionary Union." A communication was ordered made to the officers of the Congo Free State expressing the conviction of the members of the Union that the welfare and spiritual prospects, and even the continued existence, of the native population of that state require immediate suppression of the traffic in intoxicating liquors within its borders; and a request to be addressed to the Government of the United States to use its influence to secure the same result in the Congo Free State, other parts of Africa, and the West Pacific islands. A recommendation was made that a fund of \$100,000, to be called the "Judson Centenary Fund," be raised by individual subscriptions of not less than \$1,000 each, to be expended in sustaining the foreign missions. From the missions to the heathen—the Burmese, Karen, Shan, Kachin, Chin, Assamese, Garo, Naga, Telugu, Chinese, Japan, and Congo missions—were returned 67 stations, 831 out-stations, 262 missionaries, 826 native preachers, 98 Bible-women, and 257 other native helpers

—in all 1,443 missionary laborers, 642 churches with 61,062 members, 252 Sunday-schools with 7,811 pupils, 754 schools with 702 native teachers and 17,504 pupils, and 562 churches and chapels. The total of contributions for churches, schools, and general purposes, was \$44,588; value of missionary property, \$19,852. From the European missions—in Sweden, Germany, Russia, Denmark, France, and Spain—were returned 161 ordained and 307 unordained preachers, 654 churches, and 66,146 members. The whole number of baptisms during the year was 10,602—5,532 in the European, and 5,070 in the heathen missions. In the special work of translation, revision, and printing of Scriptures, the revision of the Shan New Testament had been completed, and a new edition partly stereotyped, while the Old Testament was ready for printing. The Sgau Karen Old Testament was under final revision and preparation. A new and revised edition of the Burman Bible was going through the press. The translation of the Old Testament into Assamese was nearly done, and the New Testament was under revision. Translations of the New Testament into the Lhota Naga and Angami Naga dialects had been begun. Several missionaries were engaged in translating the New Testament into different languages of the Congo. The Rev. R. H. Ferguson had been commissioned to reduce the Kachin language to writing, with a view to the translation of the Bible into it. The missions in Russia are among nominally Lutheran populations of Germanic origin—as the Letts and Esthonians—the churches among whom were gathered mostly by agents of the German Committee of the Union.

Southern Baptist Convention.—The Southern Baptist Convention met at Richmond, Va., May 11, 745 delegates being present. The convention is composed of delegates—laymen and ministers—from each Southern State. It is purely a missionary body, having no ecclesiastical jurisdiction or control of the churches, and does its work through the Foreign Mission Board, which has its office at Richmond, and the Home Mission Board, having offices at Atlanta, Ga. The former president of the convention, the Rev. P. H. Mell, D. D., Chancellor of the University of Georgia, who had presided over the meetings for fifteen years in succession, had died during the year. The Rev. James P. Boyce, D. D., President of the Southern Baptist Theological Seminary, was chosen president. The Home Mission Board had received during the year \$48,023, while \$41,154 had been raised for the same purposes by co-operative bodies (State and local boards). It had employed 287 missionaries, occupied 1,114 churches and stations, and returned 4,857 persons baptized, 431 Sunday-schools organized, with 17,240 teachers and pupils, 306 churches constituted, and 64 houses of worship built at a cost of \$54,068. The board had sustained a mission in Cuba, in which, in a little more than two years since the first church was or-

ganized, 1,100 persons had been baptized, 17 missionaries were employed, 9 native preachers had been engaged, 6 churches and 19 stations had been supplied, Sunday- and day-schools had been established, and \$4,640 had been contributed by the people in one year. The Foreign Mission Board had been incorporated. It returned an income of \$86,385, and had expended \$82,775. Its missions were in Mexico, Brazil, Italy, West Africa, and northern, central, and southern China. The women's missionary societies had contributed \$18,000 in aid of the work. The various committee reports on missionary work urged enlargement of foreign mission enterprises, enforced the importance of labors among the colored people of the South, and commended the work among the Germans, Chinese, and other foreigners in the United States, and especially that in Cuba. A collection of \$3,600 was taken for sending additional missionaries to Mexico. The two boards were instructed to appoint a committee to confer with a committee representing the Northern Baptist societies, "not with a view to organic union," but to consider what can be done to adjust their several fields and agencies, so as not to have conflict of agencies. The invested funds of the Theological Seminary were shown to amount to \$315,000, and the real estate to \$200,000. The classes included 157 students.

German Baptists.—The German Baptists of the United States are organized into five conferences—the Eastern, Central, Northwestern, Southwestern, and Texas Conferences. These conferences returned in 1887, 13,187 members, 980 baptisms, and \$127,742 of contributions for missionary and other purposes.

Colored Baptists.—The Colored Baptists of the United States are organized in three societies. The Baptist African Missionary Convention of the Western States and Territories (formerly the Baptist General Association of the Western States and Territories), formed in 1873, is interested in mission work in Africa, where it has a mission at Mukimvika, on the Congo. The fourteenth annual meeting, held in 1887, was attended by representatives of churches and associations from Illinois, Iowa, Kansas, Missouri, Nebraska, and Indiana. The society co-operates with the American Baptist Missionary Union.

The Baptist Foreign Missionary Convention of the United States, organized in 1880, at its meeting in 1887 returned its receipts at \$4,069, and its expenditures at \$4,018. Ten States were represented in the roll of its members. It has a mission among the Vey tribe on the borders of Liberia.

The American National Baptist Convention was formed in 1886. The corresponding secretary, Rev. Richard de Baptiste, who had spent two years in gathering the general statistics of the colored Baptists, reported in 1887 that 26 institutions of learning were provided for them, with which were connected

152 teachers, and 3,609 pupils; that there were 19,375 volumes in the libraries of 17 of these institutions, and that the total value of 23 of the institutions was \$1,072,140. The religious statistics of these people were as follow: number of district associations, 300; of churches, 10,068; of ordained ministers, 6,605; of members, 1,155,486; of Sunday-schools, 3,304; with 10,718 officers and teachers, and 194,492 pupils; number of baptisms last reported, 48,212; value of contributions—for salaries and expenses, \$230,445; for missions, \$23,253; for education and other objects, \$47,900. Forty journals are edited and controlled by colored Baptists.

The meetings of all of these societies for 1888 were held in succession at Nashville, Tenn., beginning on the 18th of September. They were followed by a special meeting of the American Baptist Home Mission Society to consider its work among the colored people. At a united session of the African Missionary Convention of the Western States and Territories and the Foreign Missionary Convention, a plan was reported for the unification of the foreign missionary work of the two bodies, and for co-operation with the Missionary Union. It provided for the formation of a new society, to be known as the American Baptist Foreign Mission Convention, into which the existing foreign missionary societies should be merged; and for co-operation with the Missionary Union on a plan which should allow the independence of each society while securing mutual consultation and assistance. The plan received favorable consideration, and was referred to the Executive Board of the societies and churches for discussion during the year. At the meetings of the National Convention and the Home Mission Society, papers and addresses were presented respecting the common objects in which the two bodies were interested. A resolution was adopted by the former body pledging co-operation with the American Baptist Home Mission Society in its work for the colored people.

II. Free-Will Baptist Church.—The statistics of this church, as tabulated in the "Free-Will Baptist Register and Year-Book" for 1888, give the footings: Number of yearly meetings, 48; of quarterly meetings, 183; of churches, 1,531; of ordained ministers, 1,314; of licensed preachers, 167; of members, 82,686. The latest general statistics of other liberal Baptist bodies, similar in faith and practice to the Free-Will Baptists, are those given in the "Liberal Baptist Year-Book" for 1884, and are summarized as follows: Original Free-Will Baptists of North Carolina, 8,232; other Free-Will Baptist Associations in the United States (besides those affiliated with the Free-Will Baptist Church), 4,958; General Baptists, 13,225; Separate Baptists, 6,329; United Baptists, 1,400; Church of God, 40,000 (see "Church of God" in another part of this

article); Free Christian Baptists of New Brunswick, 10,777; Free Baptists of Nova Scotia, 3,415; making, with the members of the Free-Will Baptist Church, 171,022 of similar faith.

The educational institutions of the Free-Will Baptist Church include Hilldale (Mich.), Bates (Lewiston, Maine), Rio Grande (Gallia County, Ohio), Storer (Harper's Ferry, W. Va.); Ridgeville (Ind.), and West Virginia (Flemington, Taylor County) colleges, and six preparatory seminaries. The reports of the benevolent societies are for 1887. The receipts of the Education Society were \$3,600; and the total amount of its three invested funds was \$9,908. The receipts of the Home Mission Society were \$8,108; its permanent fund amounted to \$11,125. The sum of \$5,667 had been raised and expended for home missionary work by five yearly meetings and the Central Association. The society sustained missions at Cairo, Ill., Lincoln, Neb., Oakland, Cal., Worcester, Mass., Harper's Ferry, W. Va. (with Storer College), and in the Western States. The church at Hampton, Va., had become self-supporting. The receipts of the Foreign Missionary Society were \$15,244; the amount of its Permanent fund was \$10,103; of its Bible-school fund, \$18,360; and of the Bible-school hall fund, \$63. Its missions, which are in Bengal and Orissa, India, returned 24 missionaries; 578 communicants, with 37 additions by baptism; 2,672 Sunday-school pupils; and a native Christian community of 1,229 persons. In the day and other schools were 3,628 pupils, of whom 407 were classed as "Christian," 1,481 as "Hindu," 118 as "Mohammedan," and 1,622 as "Santal."

III. The Brethren, or Tunkers.—The annual meeting of the Brethren, or Tunkers, was held in North Manchester, Ind., in May. The convention declared against the wearing of mustaches, and the trimming of hair by barbers; cautioned members in respect to taking oaths; and warned members living in Western States against writing flattering reports concerning their crops and financial success unless they were sustained by facts. It also reaffirmed its previous declarations against the use of tobacco; decided that applicants for membership should promise to refrain from the habit; and directed that ministers who chew or smoke should not be allowed to assist in church adjudications. An arrangement was made for giving help to poor congregations in Denmark and Sweden.

IV. Church of God.—The distinctive doctrines of the Church of God, as given in brief in its "Year-Book" for 1888, are:

That the believers in any given locality, according to the divine order, are to constitute one body; that the division of believers into sects and parties, under human names and creeds, is contrary to the spirit and letter of the New Testament Scriptures, and constitutes the most powerful barrier to the success of Christianity.

That the believers of any given community, organ-

ized into one body, constitute God's household or family, and therefore should, according to the teachings of the New Testament Scriptures, be known by the name of "Church of God."

That the Scriptures, without note or comment, constitute a sufficient rule of faith and practice; that creeds and confessions of faith tend to divisions and sects among believers.

That there are three ordinances of a representative character, equally binding upon all believers, namely: immersion in water in the name of the Father, the Son, and the Holy Ghost; the washing of the saints' feet (see Christ's example, precept, and promise); and the eating of bread and drinking of wine in commemoration of the sufferings and death of Jesus.

The "Year-Book" gives the statistics of sixteen annual elderships, as follow:

ELDERSHIPS.	When organized.	No. of ministers.	No. of members.
East Pennsylvania.....	1880	77	5,778
Ohio.....	1886	56	4,000
West Pennsylvania.....	1844	86	2,000
Indiana.....	1846	82	1,200
Iowa.....	1848	28	1,000
Illinois.....	1858	40	1,800
Michigan.....	1850	22	400
German.....	1854	5	200
Southern Indiana.....	1857	16	1,900
Texas, Arkansas, and Indian Territory.....	1857	27	* 900
Kansas.....	1871	27	700
Maryland and Virginia.....	1872	17	980
Nebraska.....	1875	20	500
Maine.....	1878	20	1,100
West Virginia.....	1884	20	1,000
Missouri.....	1871	12	425
Total.....	450	28,688

* Including 424 Indiana.

The total number of members, including 6,000 scattered, is estimated to be not less than 29,688. S. M. Smucker, LL. D., estimates it at 30,000.

The educational institutions are Findlay College, Findlay, Ohio, incorporated in 1882, opened for students in 1886, and now returning a faculty of 13 members and upward of 170 students; and Barkleyville Academy, Barkleyville, Venango County, Pa., chartered in 1884, having property valued at \$6,000, and returning an average attendance of about fifty pupils. The periodicals of the church include a weekly general religious newspaper and two Sunday-school journals. The Central Book Store was established in 1885, and balanced its accounts on the 30th of April, 1887, at \$20,657. The General Missionary Society was organized in 1845, and has conducted successful missions in different parts of the United States. The missions among the Cherokee Indians in the Indian Territory return 424 members, 9 organized churches, 4 Sunday-schools, 10 preachers, 12 preaching appointments, and 2 meeting-houses, with a third in building. The subject of establishing a foreign mission has been considered by the General Eldership, but nothing definite has yet been accomplished in the matter. A fund has been accumulated by voluntary contributions from the Annual Elderships, of more than \$600.

The general and highest legislative and judicatory body of the Church is the General El-

dership, which meets every three years. The next meeting will be held at North Bend, Iowa, in June, 1890.

Baptist Congress.—The seventh annual Baptist Congress was held in Richmond, Va., Dec. 4, 5, and 6. The Hon. J. L. M. Curry presided. The purpose of the meeting was exclusively the discussion of the questions laid down in the programme, with entire freedom in the expression of opinion. The first topic to be considered was "Education," respecting which papers were read on "How far shall the State Educate?" by Prof. B. Puryear, "Common vs. Parochial Schools," by the Rev. P. S. Moxom and by the Rev. Walter Rauschenbusch; and the discussion was continued by the Rev. Norman Fox, D. D., Prof. W. C. Wilkinson, and Prof. E. H. Johnson. The subject of "Temperance" was discussed in papers on "High License," by the Rev. Wayland Hoyt, D. D., and "Prohibition," by the Rev. H. A. Delano, who was supported by other speakers. Other topics discussed were "A National Divorce Law," by the Hon. A. S. Bacon and the Rev. Norman Fox, D. D.; "The Limits of Immigration," by the Hon. J. G. Sawyer, Rev. H. A. Delano, Rev. L. W. Orndall, Rev. George E. Horr, Jr., Hon. E. N. Blake, F. M. Ellis, D. D., H. McDonald, D. D., and other speakers; "Romanism: its Relation to Scientific Thought," by A. J. Rowland, D. D.; "Its Political Aspects," H. McDonald, D. D., and others; "Mohammedan Propagandism," by the Rev. F. S. Dobbins, Norman Fox, D. D., and other speakers; "Christian Science," Rev. G. E. Horr, Jr., W. E. Hatcher, D. D., and Dr. T. T. Eaton; and "The Purity of the Church—Terms of Admission," by E. T. Hiscox, D. D., and "Nature and Discipline," by F. M. Ellis, D. D., and W. W. Boyd, D. D.

V. Baptists in Great Britain and Ireland.—The "Baptist Handbook" for 1888 gives the following statistics of the Baptist churches in the United Kingdom: Number of churches, 2,764; of chapels, 3,701, containing 1,198,027 sittings; of members, 804,385; of Sunday-school teachers, 46,786; of Sunday-school pupils, 458,200; of local preachers, 4,118; of pastors in charge, 1,860. It was estimated that the churches from which no returns had been received would add 10,000 to the list of members.

Baptist Union of England and Wales.—The annual spring meeting of the Baptist Union of England and Wales was opened April 28 with an address by the Rev. Dr. Clifford on the general subject of the condition of the faith. Particular interest was attached to the question of the relations of the Union with the Rev. C. H. Spurgeon, who had withdrawn from connection with it (see "Annual Cyclopædia" for 1887), because he regarded its practice as too tolerant of persons holding and teaching doctrines of questionable orthodoxy. The Council of the Union, a kind of executive committee, consisting of one hundred members, had, in December, 1887, appointed a committee

to visit Mr. Spurgeon, and "deliberate with him as to how the unity of our denomination in true love and good works may best be maintained." This committee reported to a subsequent meeting of council, Jan. 18, 1888, that Mr. Spurgeon had declined to discuss the question of his action toward the Union, and that he could not see his way clear to withdraw his resignation; but that he had furnished a statement embodying the following conditions:

In answer to the question what I would advise as likely to promote permanent union in truth, love, and good works? I should answer: (1) Let the Union have a simple basis of Bible truths; these are usually described as "evangelical doctrines." (2) I know of no better summary of these than that adopted by the Evangelical Alliance, and subscribed by members of so many religious communities for several years. The exact words need not be used of course, but that formula indicates the run of truth which is most generally followed among us, and should be so followed.

He had, however, declared that he would not undertake, on these conditions being complied with by the Union, to rejoin it, but would await results. The question was again considered at subsequent meetings of the council, and a declaration was adopted which was intended to define the attitude of the Union in relation to the questions at issue, in terms that would be acceptable to Mr. Spurgeon. This declaration was brought before the Union at the present meeting, and after discussion and the consideration of amendments, was adopted in the following terms:

That while expressly disavowing any power to control belief or restrict inquiry, yet, in view of the uneasiness produced in the churches by recent discussions, and to show our agreement with one another and with our fellow-Christians on the great truths of the Gospel, the council deem it right to say: Baptized into the name of the Father, and of the Son, and of the Holy Ghost, we have avowed repentance toward God and faith in the Lord Jesus Christ the very elements of a new life; as in the supper we avow our union with one another while partaking of the symbol of the body of our Lord broken for us, and of the blood shed for the remission of sins.

The Union, therefore, is an association of churches and ministers professing not only to believe the facts and doctrines of the Gospel, but to have undergone the spiritual change expressed or implied in them. This change is the fundamental principle of our church life.

The following facts and doctrines are commonly believed by the churches of the Union: The divine inspiration and authority of the Holy Scriptures as the supreme and sufficient rule of our faith and practice and the right and duty of individual judgment in the interpretation of it; the fallen and sinful state of man; the Deity, the incarnation, the resurrection of the Lord Jesus Christ, and his sacrificial and mediatorial work; justification by faith—a faith that works by love and produces holiness; the work of the Holy Spirit in the conversion of sinners and in the sanctification of all who believe; the resurrection and the judgment of the last day, with the eternal blessedness of the righteous and the eternal punishment of the wicked.

As an historical fact, the last half of this statement has generally been accepted by the great majority of the Union in the usual sense; but from the first, some, while reverently accepting all divine teaching, have accepted other interpretations, which seem to

them consistent with it, and the Union have had no difficulty in working with them.

This action was not accepted by Mr. Spurgeon, who declared himself "one outside of the Union," and having no right to have anything further to do with its creeds or its declarations. "All has been done that can be done," he said, "and yet without violence we can not unite; let us not attempt it any more; but each one go his own way in quiet, each striving honestly for that which he believes to be the revealed truth of God. I could have wished that instead of saving the Union, or even purifying it, the more prominent thought had been to conform everything to the word of the Lord."

The Irish department of the British and Irish Home Mission was transferred to an executive committee in Ireland. Resolutions were adopted declaring that the question of disestablishment in Wales was ripe for settlement, and ought to be no longer postponed; and deprecating any further extension of state aid to denominational schools.

The autumnal meetings of the Union were held at Huddersfield, beginning October 1. Dr. Clifford presided. The report on the funds in connection with the Union showed that the whole amount invested up to the close of the last year was £116,554, showing an increase of about £3,000. Annuities amounting to £5,216 were paid every year. The Augmentation fund was £500 short, and the Education fund required increasing. A minute was adopted renewing the protests of the Union against the maintenance by the state of "the system of sectarian elementary schools," and reiterating the declaration that "a really national system of undenominational day-schools can alone supply the educational needs of the country without violating the rights of conscience." Meetings were held in behalf of the Baptist Foreign Missions and of the British and Irish Home Missions; and prepared papers were read and addresses delivered on various subjects of denominational interest.

Baptist Missionary Society.—The annual meeting of the Baptist Missionary Society was held April 24. Mr C. Townsend, J. P., of Bristol, presided. The income of the society had been £61,841, showing an increase from the previous year of £2,988; yet the balance-sheet exhibited a debt of £5,859, which had been caused by increased expenditure. This would, however, probably be extinguished by the proceeds of legacies which would not have to go to the reserve fund. The publication of Mr. Bentley's "Grammar and Dictionary of the Congo Language" was mentioned as an event of much importance. The use of the steamer "Peace" for the purpose of Mr. Stanley's expedition to relieve Emin Pasha (contrary to the policy of the society not to participate in enterprises that might have a military aspect) was shown in the report to have been unavoidable, because the suffering follow-

ers of the explorer had to be got out of the country. An offer of £15,000 had been made by Mr. Arthrington, of Leeds, to the society, in conjunction with two other missionary societies, for the purpose of carrying the Gospel to the tribes on the banks of the Amazon and its tributaries; but its acceptance would have involved heavy and permanent additional expenditure, and it had, therefore, been declined.

The income of the Baptist Zenana Mission in India had been £6,586. A deficit of £288 was returned.

The Bible Translation Society had published, or assisted to publish, new versions of the Bible or parts of the Bible translated by Baptist missionaries in fourteen languages of India, China, Japan, Ceylon, and West Africa. Its receipts for the past year had been £2,817. The chief items reported in the expenditure were grants of £1,600 to the Baptist Missionary Society for translations, £300 to the "Mission Press" at Calcutta, and £250 to colporteurs in India.

Baptist Union of Wales.—The statistics of the Baptist Union of Wales, reported at its meeting in August (held in Cardigan), showed that the number of churches and mission-stations had increased from 663 in 1872 to 797, and the Sunday pupils from 61,167 to 100,380. Five thousand four hundred and forty-eight persons had been baptized during the year. Resolutions were passed concerning Welsh "legislative needs" (of which disestablishment was declared to be one), condemning the recommendations of the Royal Commission on Education, and approving the society for the utilization of the Welsh language.

VI. General Baptist Association.—The one hundred and nineteenth meeting of the General Baptist Association of the New Connection was held in Derby in April. The Rev. W. H. Tetley presided. The summary of the statistics of membership showed that the total number of additions by baptism during the year had been 2,236, and the net gain of members 118. The report of the building fund showed that its capital amounted to £6,332 and its receipts for the year had been £1,399, while loans had been made to the amount of £850. Since the fund was instituted more than £18,000 had been granted in loans to the churches. The receipts for foreign missions were £8,107. The debt of the fund (£800) was reduced by £700. Action was taken in favor of an Association book fund.

BAZAINE, FRANÇOIS ACHILLE, French general, born in Versailles, Feb. 13, 1811; died in Madrid, Spain, Sept. 23, 1888. He was the son of a French officer, and after leaving the *École Polytechnique* he joined the Foreign Legion in 1831, and served five years in Africa, rising to the grade of first lieutenant, and winning the cross of the Legion of Honor on the field of battle. He went to Spain in 1837, and fought in two hard campaigns against the Carlists, returning to Algeria as captain in 1839. He

saw much fighting during the next nine years, and when the Foreign Legion, organized as a brigade of infantry, was sent to the East in 1854, he was appointed to the command. He greatly distinguished himself before Sebastopol, and after its capture was named military governor of the place, and promoted to be general

FRANÇOIS ACHILLE BAZAINE.

of division. In the Italian campaign of 1859, he commanded a division in the attack on Melegnano, where he was wounded, and in the battle of Solferino he took a conspicuous part. He was given a high command in the French expedition against Mexico, distinguished himself by brilliant and energetic tactics, and on the recall of Marshal Forey in 1863 succeeded as commander-in-chief. He received the Grand Cross of the Legion of Honor, having been made a commander in 1856, and in September, 1864, he was promoted Marshal of France. His vigorous aggressive strategy drove President Juarez into a corner of the country. The fortress of Oajaca surrendered in February, 1865, the garrison of 7,000 men laying down their arms. He also organized a barbarous but effective system of guerilla warfare. Bazaine married a wealthy Mexican lady, and soon afterward misunderstandings arose between him and the Emperor Maximilian, who suspected the French general of lukewarmness in his cause, when fortune began to turn in favor of Juarez, owing, as Bazaine alleged, to the obstinate resistance of the Mexicans and the policy of the United States. Napoleon sent orders for the ultimate withdrawal of the French troops, and when Bazaine was suspected of a design to make himself emperor instead of Maximilian, he dispatched Gen. Castelnau to arrange the evacuation.

Finally, at a council of Mexican notables, Bazaine declared the maintenance of the empire impossible, and on March 12, 1867, having retreated to Vera Cruz, he embarked with all his forces for France. On his arrival he was greeted with a storm of reproaches. He nevertheless retained the confidence of Napoleon III, and was made a senator and intrusted with the command of the corps stationed at Nancy, and in October, 1869, was given the chief command of the Imperial Guard.

When the Franco-Prussian War began, Bazaine had command of the Third Corps. He might have supported Gen. Frossard at Forbach, but would not move without orders. On Aug. 13, 1870, he took command of the Army of the Rhine, with which he checked Gen. Steinmetz at Berny on the following day, allowing Napoleon and his staff to retreat in safety. He retired on Metz, perhaps in order to detain the enemy until MacMahon's army was formed at Châlons. If he had ordered the Imperial Guards to support Canrobert at Gravelotte, the Germans might have been driven into a retreat, instead of forcing him to retire into the citadel of Metz. His army was the only compact force that remained after the surrender of Marshals Lebœuf and Canrobert and the capture of the Emperor. The garrison made many brave sorties, but each party was beaten back. After fruitless efforts to obtain better terms, the commandant signed a capitulation on Oct. 27, 1870, before a single shot of the enemy had fallen within the walls of the fortress, in accordance with which his command of 173,000 men marched out without their arms. His declaration that his army was vanquished by famine was contradicted by witnesses, who said that there was food, and that the men had in their knapsacks six days' rations. Accusations of treachery resounded on every side. It was discovered on investigation that he had held communication with Bismarck through a go-between named Regnier, and after learning the pretended determination of the Germans not to treat on any terms with the Government of National Defense, had allowed himself to be duped into inactivity and finally into a surrender by Bismarck, who suggested that far better conditions of peace would be granted if he kept his army intact in order to support a serious Government with which Germany could negotiate. Thus the wily diplomatist held out the hope of the restoration of the empire with German aid. After his return from captivity Bazaine published a book entitled "*L'Armée du Rhin*," in which he avowed that he felt no obligation to obey the Government of National Defense after the downfall of the empire, and considered himself justified in acting independently. It was not till then that he was cited to appear in August, 1871, before the Committee of Military Investigation of the National Assembly at Versailles. He offered himself for trial by court-martial without awaiting the report. He

was not arraigned till Oct. 6, 1873. The Duc d'Aumale presided over the tribunal. The marshal, who wore his full uniform and the decorations of the Legion of Honor, in reply to the charges of military incapacity in letting himself be blockaded in Metz by a force not much superior and in capitulating, and of treasonable correspondence with the enemy with the object of making himself independent of the Government of National Defense, he said that the motto of "honor and country" that he bore on his breast had been his for the forty years that he had served France, at Metz as well as elsewhere. He was found guilty (1) of having capitulated before the enemy in the open field; (2) of having agreed to terms making his command lay down their arms; (3) of having entered into negotiations with the enemy before doing all that duty and honor demanded; (4) of having surrendered a fortified place that was intrusted to him to defend. He was condemned on December 10 to death and military degradation, but in compliance with the unanimous recommendation of his judges, President MacMahon commuted the sentence to twenty years' seclusion. He was incarcerated in Fort Sainte Marguerite, near Cannes, on December 26. In the following August he lowered himself from a window by a rope into a boat, on which he made his escape to a ship lying off the island, and reached Italy. From there he went to Cologne, and to England, and finally he took up his residence in Madrid. In September, 1874, he published in the New York "*Herald*" a defense of his conduct during the war, to which Prince Friedrich Karl bore honorable testimony, and in 1888 he went over the ground again in a volume.

BEDS, FOLDING. Bedsteads so contrived that they can be folded into a more or less compact form are to be found in all civilized and, perhaps, in some uncivilized lands, and are of almost as many different patterns as are the tables and chairs that keep them company. Goldsmith's familiar lines in the "*Deserted Village*" are more than a century old:

The chest contrived a double debt to pay,
A bed by night, a chest of draws by day,

and they go to show that folding beds were not uncommon at that time. In 1888 about forty patents were issued in the United States bearing upon such articles of furniture, and a visit to any industrial exhibition or large furniture establishment affords abundant evidence that the supply keeps well up with the demand. This is largely due no doubt to the crowding of population in the large cities. Where a family occupies a flat or "apartments," the question of space becomes very important, and where a single person occupies a room, perhaps a small one, his comfort is greatly enhanced by being able to double the floor-space by disposing of the bed during the day-time.

To begin with the simpler and least expensive forms of folding beds, it may be said that ingenious mechanics not infrequently provide

themselves with convenient devices of this character without calling upon the furniture-dealer.

FIG. 1.—A HOME-MADE FOLDING-BED.

One of the simplest possible is shown in Fig. 1. It is a shallow oblong box with the bottom preferably of slats and the sides and ends deep enough to receive the mattress and coverings that are to be used. This depth should exceed the thickness of the mattress by three or four inches. Diagonal braces may be placed at the corners to prevent the racking unavoidable in raising and lowering. One side of the box is attached to the wall by means of strong iron hinges (A A) which should be screwed to the studs if the wall is of lath and plaster, or otherwise secured so as to bear the strain. To the other side of the box, legs (B B) are attached, also by hinges, so that they lie flat against the slats when the bed is raised to its day-time place and secured by hooks against the wall. To keep coverings and mattress from falling against the wall when the bed is lowered, bands of some suitable material are used.

The same general principle may be employed with any of the light cots kept by dealers, but in this case the wall-hinges must be attached to projections bearing them out from the wall so that there will be room for mattress, covering, etc., between wall and slats. It will naturally occur to any one with an eye to decorative effects, that a curtain hung over this somewhat unsightly object when it is hooked up, will effectually conceal it, and it may, with the exercise of a little taste, be made really ornamental.

The occupant of a narrow hall bedroom in New York requiring more space and a table, had recourse to the device shown in Fig. 2. The bedstead was one of the light cots referred to above. Fixing two stout screw-eyes (O O) in the studding at the head of the bed,

he lashed the head-piece loosely to them, so that the lashings should serve as hinges. To the foot of the bed he attached a line and passed the free end through a pulley (D) fixed near the ceiling. It was an easy matter, the bedding being properly lashed, to hoist the whole affair until it rested flat against the wall as shown in the figure. For additional security, the long slack of the hoisting-line was passed around outside the bed and made fast to two hooks about seven feet from the floor. The upper pair of legs was either folded down as shown or opened and used as a shelf. A drawing-board placed upon the lower pair of legs, as shown in the engraving at E, converted them into a very passable substitute for a table. Recently some inventor has hit upon the same idea, and has patented it with some improvements and elaborations.

On yachts and other small vessels folding bunks are sometimes provided for the crew by stretching stout canvas across a rectangular iron frame and hinging the frame to the lining of the vessel. In this case the outer side of the frame is supported by hooks attached to lines depending from the deck-beams. When not in use, the frames are folded up flat against the side of the vessel, and occupy scarcely any room at all.

The next step in elaboration is the "mantel-bed," so called, which is

FIG. 2.—BED AND TABLE COMBINED.

rails sliding on rods are drawn in front of the whole structure, and the top may even be used as

a shelf or mantel. Ingenious self-acting attachments adjust the legs of the bedstead, so that they open or shut as the bed is lowered or raised.

A slightly more complicated form of the mantel-bed is similar in structure, save that it folds endwise, involving a joint midway of the mattress and side-pieces.

The bedsteads thus far described are quite moderate in price, and are coming into use very extensively. They are better in many respects than the more costly kinds, since the open structure admits free circulation of air through and about the mattress and coverings while they are not in use. The more elaborate and ornamental folding beds, "cabinet-beds," as they are sometimes called, are manufactured in a great variety of styles, and are very complete and ingenious in all their appointments.

Figs. 3 and 4 show one of the direct-acting kind, where the bed is wheeled outward before being lowered from its upright position. The raising and lowering are usually facilitated by counter-weights, springs, or pulleys concealed in the casing. For low-ceiled rooms cabinet-beds are made which fold in the middle, instead of being raised bodily. These, however, project farther into the room when folded, and in them it is impracticable to use the "wire mattresses" as generally furnished to the trade.

Cabinet or furniture bedsteads are often only ornamental coverings for the bedding, but many of them include also a wardrobe, with drawers, or, if desired, a washstand, mirror, and the like, all very compact and convenient. These beds stand with the side to the wall when in use, or with the foot to the wall if preferred. That is to say, the wardrobe part is swung or pulled out toward the mid-

tended for use in camps or wherever easy transportation is essential. The common type of cot with a canvas support for the mattress and

FIG. 4.—CABINET-BED—END.

coverings is so well known that it does not require illustration. In effect it is precisely like the one shown in Fig. 5, except that the legs can not be folded parallel to the side-pieces, lacks the long braces marked A A.

5 shows one of the best camp-beds market. The legs turn on a bolt in the manner at B, but are so attached to the side, by means of an iron fixture, that they fold parallel to the side-rails, and up in the canvas as shown at C. When open for use, the bed is six feet three long and twenty-nine inches wide; it forms a roll about six inches in diameter one way and four inches the other way. The weight is fifteen pounds.

A camp-bed somewhat more elaborate in construction than that shown in the illustration has semi-cylindrical side-rails of wood. They are made of three-ply veneering similar to the chair-seats commonly in use, except that they are not perforated. To these the canvas stretcher is firmly tacked, and within them are simple iron fixtures to serve as braces for the legs. All the attachments are laid within the hollow semi-cylinders when the bed is to be folded, and then the canvas is rolled and packed between the two, which, when strapped together, form a handsome varnished cylindrical box less than

FIG. 3.—CABINET-BED—SIDE.

beds in front and side elevation. When not in use, it is a handsome piece of furniture, and to a casual observer suggests nothing more than an ordinary wardrobe and bureau. Another class of folding-beds includes those in-

four inches in diameter, and weighing altogether eleven pounds.

Many varieties of camp-beds are manufactured which fold much more compactly than those here described, some of them within the dimensions of a moderate sized valise. These may all be classed as were modifications of the cots described. Taking Fig. 5, for instance, cutting the side-rails into four pieces, and fur-

FIG. 5.—CAMP-BED.

nishing each section with independent sets of legs, it is evident that the whole could be rolled up in a more compact form than that shown. The weight, however, is naturally increased, and the trouble of taking apart and putting together is considerably greater. Where space for transportation is to be considered, some of these more compact devices are very convenient.

BELGIUM, a monarchy in western Europe. It was formerly a part of the Netherlands, but seceded and formed itself into an independent state in 1830. Prince Leopold of Saxe-Coburg-Gotha was elected king by a National Congress in the following year. His son, Leopold II, the present King of the Belgians, succeeded to the throne on Dec. 10, 1865, at the age of thirty. The law-making power is vested in two chambers, called the Senate and the Chamber of Representatives, both of which are elective. The members of the Cabinet, who assumed office on Oct. 26, 1884, are as follow: President of the Council and Minister of Finance, A. Beernaert; Minister of Justice, J. Lejeune; Minister of the Interior and of Public Instruction, J. Devolder; Minister of War, Gen. C. Pontus; Minister of Railways, Posts, and Telegraphs, J. H. P. Vandenpeereboom; Minister for Foreign Affairs, Prince de Chimay; Minister of Agriculture, Industry, and Public Works, the Chevalier A. de Moreau.

Area and Population.—The area of the kingdom is 29,455 square kilometres, or 11,373 square miles. The estimated population on Dec. 31, 1886, was 5,909,975, comprising 2,951,300 males and 2,958,675 females. Between 1880 and 1886 the rate of increase was 1.14 per cent. per annum. According to the census of 1880 there were 2,237,867 Belgians speaking French only, and 2,479,747 speaking Flemish only, while 41,046 could speak only

German, and 471,872 spoke at least two of these languages.

All the people of the kingdom are professing Catholics except some 15,000 who are Protestants and 3,000 Jews. Education is backward, but is gradually becoming diffused under a law making elementary education more general than it formerly was. Universal education is one of the demands of the Liberals, but the party in power opposes it, and is sustained by a decided majority of the electors, composed of the wealthy class and constituting only one tenth of the adult male population. The budget of 1888 allots 1,613,620 francs for superior education, 3,747,490 francs for intermediate education, and 10,167,774 francs for primary education. Of the total population over fifteen years of age in 1880 the proportion who could not read nor write was 42 per cent., whereas between the ages of seven and fifteen it was only 29.4 per cent.

The number of births in 1886 was 166,451; of deaths, 116,264; of marriages, 39,642; excess of births over deaths, 50,187. The number of emigrants in 1886 was 17,029, which was less by 2,775 than the number of immigrants. The population of the principal cities on Jan. 1, 1887, was as follows: Brussels, with suburbs, 425,204; Antwerp, 204,498; Ghent, 145,424; Liège, 137,559.

Revenue and Expenditure.—The ordinary budget for many years has almost invariably shown a deficit. In 1885, when an extraordinary expenditure of 44,974,750 francs was contemplated in the estimates, with an estimated extraordinary revenue of only 6,159,884 francs, the ordinary budget was revised so that there remained a small surplus. In the following year, instead of the expected surplus of 8,000,000 francs, there was an actual deficit of more than that amount. In 1887 the revenue fell below the expenditure nearly 2,500,000 francs. The estimates for 1888 make the total ordinary revenue 313,641,559 francs, and the ordinary expenditure 307,743,123 francs. The income from property taxes is estimated at 23,883,100 francs; from personal taxes, 19,232,000 francs; from trade licenses, 6,580,000 francs; from customs, 24,682,600 francs; from excise, 39,775,500 francs; from registration duties, 23,860,000 francs; from succession duties, 19,420,000 francs; from stamp duties, 6,820,000 francs; from railways, 114,500,000 francs; from telegraphs, 3,103,700 francs; from the post-office, 9,421,300 francs; from navigation dues, 4,280,000 francs; from the national bank and amortization funds, 11,493,100 francs; from domains and forests, 1,300,000 francs; from other sources, 5,290,259 francs.

The expenditure for interest on the public debt amounts to 96,102,231 francs; civil list and dotations, 4,568,675 francs; for expenses of the Ministry of Justice, 15,426,361 francs; of the Ministry of Foreign Affairs, 2,377,020 francs; of the Ministry of the Interior and Public Instruction, 21,829,764 francs; of the

Ministry of Public Works, 16,712,281 francs; of the Ministry of Railways, Posts, and Telegraphs, 83,850,116 francs; of the Ministry of War, 46,008,270 francs; of the Ministry of Finance, 15,290,905 francs; of the gendarmerie, 3,946,000 francs; repayments and other expenditures, 1,686,500 francs.

The national debt, including the capitalized value of annuities amounting to 30,106,000 francs, exceeds 2,500,000,000 francs. The funded debt consists of 219,959,683 francs of 2½-per-cent. bonds, 519,859,000 francs of 3-per-cents., and 1,185,509,458 of 3½-per-cents. The credit of the Government, notwithstanding its large and gradually increasing debt, is so good that the 3½-per-cent. bonds stand at 2 per cent. above par in the market.

The Post-Office.—The number of letters that passed through the Belgian post-office in 1886 was 90,744,556, not reckoning 14,128,401 official letters; the number of postal cards, 26,568,401; printed inclosures, 55,268,000; newspapers, 94,894,000. The receipts during 1886 amounted to 14,806,595 francs, and the expenditure to 8,893,171 francs.

The Army.—The army budget for 1888 fixes the peace effective at the following figures:

TROOPS.	Officers.	Rank and file	Total.
Infantry	1,187	82,495	84,382
Cavalry	356	5,506	5,862
Artillery	447	7,661	8,108
Engineers	90	1,479	1,569
Gendarmerie	58	2,080	2,138
Train	452	1,350	1,802
Total	3,815	50,571	53,886

The staff, numbering 125 officers, and 772 officers of the medical corps, are not included in this statement. The number of horses is 8,900; of guns, 200. The war-strength of the army is 120,000 men, 13,800 horses, and 240 guns. There is besides a civic guard, which in 1887 numbered 41,222 men.

An extensive plan for fortifying the line of the Meuse was adopted in 1887, but the Government has resolved for the present to direct its efforts chiefly to extending and arming the fortifications at Liège and Namur. These two fortresses will absorb all the army at its present strength, except the troops that are required to garrison Brussels and the central citadel at Antwerp. The Ministry of War has obtained a credit of 60,000,000 francs for the purchase of modern ordnance of large caliber. The works at Liège, when extended to the adjacent heights, are considered sufficient to arrest the passage of a German army up the Meuse valley. Namur on the French side is not so strong a position, and only guards one of the routes from France, while that by way of Mons and Charleroi is left open. Contracts have been awarded for the construction of twenty-one metallic forts along the Meuse, which will strengthen the defenses against a German invasion. They will consist of cupolas and will be completed by the end of 1890.

Commerce and Industry.—The returns for the general commerce of 1886 give the value of the imports as 2,662,715,581 francs, and of the exports as 2,512,122,555 francs. The imports for home consumption amounted to 1,335,049,000 francs, and the exports of Belgian produce to 1,181,974,000 francs. The imports of breadstuffs were valued at 205,069,000 francs; the exports at 54,514,000 francs; imports of textile materials, 177,211,000 francs; exports, 98,154,000 francs; imports of yarns, 27,121,000 francs; exports, 136,261,000 francs; imports of tissues, 31,546,000 francs; exports, 67,288,000 francs; imports of live animals, 72,047,000 francs; exports, 84,641,000 francs; imports of hides and skins, 79,926,000 francs; exports, 69,929,000 francs; imports of chemicals, 52,669,000 francs; exports, 18,551,000 francs; imports of timber, 50,972,000 francs; of metals, 29,866,000 francs; of oils, 21,022,000 francs; exports of iron, wrought and unwrought, 54,118,000 francs; of machinery, 50,818,000 francs; of coal, 50,127,000 francs; of glass, 48,940,000 francs; of sugar, 32,567,000 francs; of paper, 23,614,000 francs; of steel, 17,672,000 francs; of arms, 13,127,000 francs. The export of sugar in 1885 exceeded the import by 58,000 metric tons. The product of pig and wrought iron in 1885 was 1,182,125 tons, and in 1886 it was 1,167,132 tons.

The share of France in the import trade of 1886 was 251,081,092 francs, and in the export trade, 329,580,022 francs. Great Britain furnished 172,824,410 francs of the imports, and took 236,416,435 francs of the exports. The imports from the Netherlands were larger, amounting to 199,841,114 francs, while the United States came next after England with 160,894,949 francs of imports, Germany following with 151,941,981 francs, and then Russia with 74,224,681 francs, the Argentine Republic with 59,981,438 francs, Sweden and Norway with 37,941,106 francs, Roumania with 31,807,880 francs, Peru with 29,840,208 francs, Brazil with 21,846,203 francs, and Uruguay with 17,574,454 francs. The third largest consumer of Belgian products was Germany, the exports to that country amounting to 195,790,476 francs. The Netherlands took 175,417,466 francs. The exports to other countries were small in comparison, 40,647,175 francs going to the United States, 34,064,322 francs to Italy, and 29,457,862 francs to Switzerland, after which come Spain, the Argentine Republic, Brazil, Turkey, and Russia.

Navigation.—In 1886 the number of vessels entered at Belgian ports was 6,216, of 4,094,026 tons, of which 3,367, with a total tonnage of 2,351,344, were British. The number cleared was 6,206, of 4,060,901 tons. The commercial marine in 1887 numbered 67 vessels, of 86,837 tons, of which 55 vessels, of 81,285 tons, were steamers. There were 342 fishing vessels, of 12,009 tons.

Railroads.—The lines worked by the state

had a length of 3,175 kilometres, and the lines worked by companies were 1,246 kilometres in length on Jan. 1, 1887, making a total of 4,421 kilometres, or 2,768 miles. The receipts of the state railroads in 1886 were 117,918,879 francs, and the expenses 66,241,271 francs. On the lines of the companies the receipts were 85,144,278 francs, and the expenses 19,213,485 francs. The capital expended by the Government in building railroads was 929,697,462 francs up to the end of 1885, while railroads that had been purchased were paid for in annuities representing 319,798,681 francs of additional capital.

Telegraphs.—The number of dispatches, private and official, in 1886 was 6,798,108. The length of lines on Jan. 1, 1887, was 3,800 miles, with 17,900 miles of wire. The receipts for 1886 were 2,868,650 francs, and the expenses, 3,679,250 francs.

Elections.—The biennial elections for one half of the seats in the Chamber, and the quadrennial elections for the renewal of one half of the Senate were held on June 12, 1888. The Conservatives, who in the last Chamber numbered 96 against 42 Liberals, and in the Senate 42 against 27, were successful, owing to the defection of the Radicals who had previously supported Liberal candidates. In the new Chamber there are 98 Conservatives and 40 Liberals, and in the Senate 51 Conservatives and 18 Liberals.

The Language Question.—The Flemings have recently raised the language question by organizing a party to secure for their mother-tongue the equality that the Constitution guarantees. Until Hendrik Conscience demonstrated the literary capabilities of Flemish, and appealed to race pride in his historical and satirical passages, the Flemings were content to see the French employed almost exclusively in official intercourse, in the courts, and in the army, and even cultivated it themselves in their commercial and social relations. When their national spirit was finally aroused, the adoption of French as the language of instruction in the Royal Athenæum, which was opened at Antwerp in 1886, gave occasion for its manifestation in a storm of indignation that compelled the Government to alter its decision. In the summer of 1887 the King was almost mobbed for delivering a French oration at the dedication of statues to Flemish heroes in Bruges. The inequalities of which the Flemings complain are that no official is appointed to a post in southern Belgium without being conversant with French, whereas there are thousands in Flanders who know no Flemish; that French is the language of public boards and assemblies and of the army; and, notably, that it is used in military and criminal courts in Flanders, even when the accused person speaks only Flemish. The knowledge of French has long been a prerequisite for an appointment in the army. Deputy Coremans, of Antwerp, introduced a bill requiring candidates for com-

missions to be examined in both languages, and the Government adopted the measure, which simply carries out a provision of the Constitution. Its practical effect would be to exclude Walloons from officers' posts, and after it had been passed by a large majority, the Government was induced by popular clamor to recede from the constitutional position and support a substitute measure, which merely recommended the study of Flemish. By this action the ministry offended not only the Flemish Liberals, but the Clericals, who had been its firm supporters.

Foreign Relations.—The Belgium scheme of fortification aroused the jealousy of the German Government, which endeavored in 1888, with partial success, to force Belgium into a military alliance and secure an understanding by which the fortress of Liège and the railroads will be handed over to the Germans in the event of another French war. King Leopold's sympathies are supposed to be with Germany by reason of family ties and dynastic traditions, while the present Clerical-Conservative ministry is suspected of the same partiality or, at any rate, of antagonism to the ruling powers in France. The prevailing sentiment among the people, however, leans toward France. The Liberal party and the entire Walloon population of the south are warm friends of the republic, while the Flemings are indifferent. By manifesting a desire to exert diplomatic pressure on Belgium, the German Government aroused the anti-German feeling of the country; but since England has refused to renew her pledges in regard to defending the neutrality of Belgium, and is even partly committed to the anti-French alliance, the Belgian Government may be constrained to meet the wishes of Germany. Early in 1888 the German minister made complaints respecting attacks on the German Government by a portion of the Belgian press. This was hardly done with a view to the immediate abatement of the offense, because the Belgian press is the freest in Europe. The Liberal organs assail the King and his Cabinet with the full liberty that the Constitution accords, and if they use the same license in speaking of German policy the Ultramontane journals denounce the French authorities in terms as immoderate. These representations regarding the press led up to others relative to the French control of the Nord Belge Railroad, which the German Government complained gave an unfair strategical advantage to France, although the railroad from Verviers to the German frontier was in German hands and the entire network of the Duchy of Luxembourg was worked by the imperial railroad administration of Alsace-Lorraine. Finally came the overtures with regard to the occupation of Belgian fortresses by Prussian troops in case France should begin a war against Germany. The French sympathies of the people, especially of the Walloons, who are not only allied to the French in blood and lan-

guage, but are grateful to them for their aid in the struggle for Belgian independence, is manifested on every occasion. The Socialists, for instance, when forbidden to bear the red flag in their processions, carry the French colors in its stead, and journalists and politicians of Liberal views express distrust and alarm at the aims of Germany. King Leopold is the special object of Radical and Republican attacks on account of his suspected predilections. When he visited Louvière in the summer a mob of 25,000 workmen gathered in the streets, shouting "Down with the German!"

Adjustment of the Netherlands Boundary.—By the treaty of November, 1842, and the boundary convention of August, 1843, the rectification of the frontier between Belgium and Holland was left for amicable settlement between the two countries. A convention was made on Jan. 5, 1888, with reference to the exchange of some villages on the frontier, and also relative to the boundary, which was fixed in the canal of Terneuzen. The communes of Baarle and Hertog, in North Brabant, were transferred to the Netherlands, because it was impossible to enforce customs regulations within them, and the situation had created difficulties for both governments.

International Congresses.—An international industrial exhibition at Brussels was opened on June 7, 1888. It attracted many exhibitors from England, France, and other countries.

An International Congress of Commercial Law met at Brussels, on September 30, to elaborate a project of international legislation in the matter of bills of exchange and maritime law in conformity with the principles approved at the former session at Antwerp in 1885.

An international conference having for its object the co-operation of the principal states in collecting and publishing information regarding their customs tariffs was held at Brussels in March, and adjourned for six months after adopting a draft convention, which it was expected the governments would accept. The co-operation of customs officials in compiling such information not only will save merchants from trouble and losses resulting from ignorance and misunderstanding, but may lead to the removal of anomalies in the various tariffs.

Offices have been established by the Belgian Government for the purpose of supplying persons intending to emigrate with information of use to them that can be obtained through the diplomatic and consular agents.

BETTING. The modern practices of betting, in their various forms, especially among people who speak the English tongue, are so popular and so dangerously demoralizing that their reasonable restriction has become one of the legislative problems of the day. The practice is as old as the race, and, like gambling for stakes and the use of intoxicants, is so common to mankind in general that its complete suppression can hardly be looked for while human nature remains as it is.

None of the lexicographers have discovered or devised a satisfactory derivative origin for the word "bet." A bet may be defined as a sum of money or its equivalent promised by one person to another if some doubtful question is decided in a specified way. The possible variations upon this simple statement of the case are nearly infinite; the bet may be made between two persons only on even terms, or between any number of persons on uneven terms. It may rest upon the result of a single event or upon the combined result of any number of events. In short, it offers all the unhealthy excitement of gambling, without the formalities that usually surround the card-table.

Betting has, until within a generation, been more common among the upper classes, so called, in Great Britain than among the corresponding classes in America. This is largely due to the influence of New-England schools and churches where it was taught that all betting was not only dishonest and dishonorable, but sinful as well. That these teachings had, and still have, a powerful restraining influence is not to be questioned, but it is equally indisputable that the habit of betting on all manner of events is rapidly gaining ground in all classes of society.

Probably there was never before so much betting on the result of an election as during the presidential canvass of 1888. It was estimated that in the city of New York alone something like \$2,000,000 changed hands within a few days. Syndicates were formed by the different parties for the placing of bets. In many instances odds were given and the money placed in the hands of a stake-holder. One somewhat notorious person in New York is reported to have had nearly \$70,000 in current funds in his possession.

All this is contrary to law, and the vote of any person having a bet that might influence that vote may be challenged. In most of the States there are statutes more or less rigorous against betting in various forms, but it may be said that in general nobody minds them, and pool-selling, book-making, and betting on horse-racing, boat-racing, ball-matches, and the like, goes on without apparent let or hindrance. In the United States, laws against betting have been so long in existence that their inefficiency has for the most part failed to excite comment.

In Great Britain there has been comparatively recent legislation, which has an interesting bearing on the question. While it is manifestly impossible to enforce a law prohibiting private bets between individuals, however objectionable such bets may be, it is certainly within the legitimate province of legislation to make it dangerous for designing persons to ply their trade in a public way.

In Great Britain the evils of betting have been recognized in the statutes at least since Queen Anne's time, when if any one gained a

bet of more than ten pounds the loser was entitled to recover the amount if he had paid it, and if he did not do so within three months, any one might sue him for three times the amount, with costs. This act was long a dead letter, but was unearthed for some purpose in 1844, and subsequently annulled by the Gaming Act (8 and 9 Vict.). Unfortunately as it seems, the annulment of this act was closely coincident with an enormous increase in betting on horse-races. "List shops" were opened, where any one could stake money in advance on any horse, and so many acts of dishonesty were perpetrated that the Betting Houses Act (16 and 17 Vict.) was introduced by Sir Alexander Cockburn, afterward Lord Chief-Justice of England, and by him carried successfully through Parliament. This act suppressed all permanent places kept expressly for betting purposes, the object being to remove obtrusive temptation from the daily walks of the multitude, who were the easiest prey of swindlers. The act applied only to England, and one result was that Scotland soon became a headquarters for the professional swindlers of the United Kingdom. In due time, however, the provisions of the act were extended to Scotland, and the evils arising from established and permanent betting-places were largely diminished. This act, carefully prepared by George Anderson, of Glasgow, went into effect in July, 1874, upon which the Scottish betting-agents closed their establishments and moved to Boulogne, where a thriving business was carried on by mail and otherwise, until the evil results became so manifest that the French Government in turn interfered, and the agents were driven to new devices. So successful are they, however, in evading the law, that it is estimated that about £5,000,000 changes hands every year on the results of horse-racing alone.

In England, legislation appears to discriminate between what is termed "ready-money" betting and betting on credit, the former being made illegal, while the latter is not so specified. One result has been that among the poorer classes small clubs have been formed, where betting is carried on upon credit, just as it is among the wealthy at their palatial club-houses. Bets of honor, these are called, and when a "gentleman" or a "nobleman" loses, he will go to any extreme to meet his obligations on the Monday following; repeatedly have men mortgaged their lands and pawned their wives' jewels in order to escape the disgrace that would follow the non-payment of such an obligation. It has therefore been held that it would be better, if possible, to place restrictions upon betting on credit, rather than upon betting with ready money, since the credit system permits the bettor to incur any number of liabilities for almost any period of time, in advance. He loses, let us say, on the first event, but hope bids him strain every nerve to meet his obligations, for may he not win on the second? If all betting transactions involved cash

in hand and a stake-holder, it would seem that the incitement to great sacrifices of real property under stress of emergency would be largely wanting.

It is a noteworthy feature of betting transactions that no legal documents or contracts are in use. Millions of dollars and hundreds of thousands of pounds change hands every year on the strength of a memorandum penciled in a note-book at the time of making the bet. All betting is conducted, as the phrase goes, "upon honor," and, considering the magnitude of the transactions, it is certainly remarkable how few are the failures to pay.

Whether it is possible wholly or even partially to restrict betting, is a question that can be argued on both sides, with little hope of settlement. That the practice is demoralizing in the extreme is unquestionable.

A professional sharper is said to have summarized the case as follows, when asked how he made his calling pay: "It follows by a law of Nature," said he. "We are told that there is a child born into this world every second, and therefore there must be a daily addition of more than five millions to the population of the globe. Now, the deuce is in it if, with this continual rising of fresh spoonneys to the surface of society, I can not come across as many as will serve my turn."

It is this class of professional sharpers that is most harmful to the community, and any reasonable legislation looking to restraining their proceedings would be welcomed by all the law-abiding classes. The making of private bets can probably be prevented or restrained only by promoting a sentiment against it; but it would seem possible and desirable to prohibit public betting, and especially to render betting on elections dangerous as well as disreputable.

The talk of racing and betting men abounds in slang phrases, many of which, as used in England, are not understood by Americans. As they are frequently encountered in English novels, a few definitions are appended. A "dollar," in betting parlance, means five shillings; a "quid" is a pound sterling; "fivers" and "tenners" are respectively five- and ten-pound notes; a "pony" is twenty-five pounds; a "century" is one hundred pounds; and a "monkey" is five hundred pounds; a "thou" is the recognized abbreviation of thousand. "A stiff 'un" or a "dead 'un" is a horse that has been entered for a race, but will not compete; "skinning the lamb" means that the book-maker has not bet against the winning horse. "Hedging," in its simplest meaning, implies that a bettor having made his bet, becomes fearful of losing, and bets the other way, so as to make the accounts balance as nearly as may be. A more elaborate definition is given as follows by an English writer: "Suppose that a betting man backs a particular horse for a certain race before the entries are due, and that the horse is entered, favor-

ably weighted, and accepts—it is pretty certain to come to shorter odds than it was backed for. After its owner has accepted, it may be assumed that the price will not be more than fifty to one, which the maker of the bet will lay to the same person, so that he may himself stand to win fifty pounds to nothing! That is hedging." Further, if the horse becomes a favorite, and attains the price of say ten to one, the bettor may lay off or hedge twenty-five pounds more, in which case he is said to "stand on velvet." In other words, he is sure to win in any event, hence the turf proverb, "No bet is good until it is well hedged to."

BÉZIQUE (bay-zeek), a game with cards. Sometimes it is spelled *basique*. The word seems to be naturally derived from the Spanish *besico*, a little kiss, in allusion to the distinctive feature of the game, as hereinafter described, namely the "marriage" of the queen and the knave. Murray gives it as a corruption of the French, *besique*, a game at cards. Bézique, in its present form, is a revival, with modifications, or perhaps a combination of several old games possessing certain features in common. Chief among these is "marriage," and among the others are "brusquem-bille," "l'homme de bron," "briscan" or "brisque," and "cinq cents." "Brisque" bears the closest likeness to bézique, and is, in fact, nearly identical save that it is played with a double pack and with certain features rendered necessary by the introduction of additional cards. The following rules and directions govern the game in America, and are substantially identical with those accepted elsewhere. They are, in the main, rules as laid down by "Cavendish" (Henry Jones), the recognized English authority on the game:

In bézique two packs of ordinary playing cards are used, but before shuffling all cards below the denomination of seven are rejected, as in euchre, and the remaining 64 cards (32 in each pack) are cut as usual. The game may be played by two, three, or four persons.

Two-handed Bézique. The dealer deals eight cards to himself and his adversary as follows: three to his adversary, three to himself, then two to each, and again three to each.

The cards rank as follow: Ace, ten, king, queen, knave, nine, eight, seven. In case of ties the leader wins. Trumps win over suits.

The objects of the play are: 1. To promote in the hand various combinations of cards which, when declared, entitle the holder to certain scores as given in the table; 2. To win aces and tens; 3. To win the so-called last trick.

After dealing, the cards remaining undealt are called the "stock." They are laid on the table a little to one side, and the top card is turned up for trumps, and laid near the stock, and the stock cards are slightly spread so that they can be readily taken by the players as the game proceeds.

The non-dealer plays any card out of his hand. The dealer plays a card to it, the two constituting a "trick." He need not follow suit, nor play a card that wins the trick. If, however, he wins the trick by playing a higher card or trumps it (which he may do, although holding in his hand a card of the suit led), he has to lead. Whoever wins the trick has the next lead; but, before playing, each player draws one card from the stock, the winner of the trick drawing

the top card, the other player the card next it; by this means the number of the cards in each hand is restored to eight, as at first. This alternate playing a card and drawing a card continues till all the stock, including the trump card (generally exchanged for the seven), which is taken up last, is exhausted. The rules of play then are as hereinafter prescribed. The tricks are left face upward on the table until the end of the hand; they have no value except for the aces and tens that they contain.

Declaring.—A "declaration" can only be made by a player immediately after winning a trick, and before drawing a card from the stock. The declaration is effected by placing the declared cards face upward on the table, where they remain. Though left on the table, they still form part of the hand, and can be played to a trick just the same as if they had not been declared. Each score is marked at the time of declaring.

Players are not bound to declare unless they like, although they may win a trick and hold scoring cards.

A card can not be played to a trick and be declared at the same time.

It is optional to declare or exchange the seven of trumps after winning a trick with some other card. When declared the seven need not be shown unless asked for. When exchanged the seven is put in the place of the turn-up card, and the turn-up is taken into the player's hand. The card taken in exchange for the seven can not be declared until the player exchanging has won another trick.

Any number of combinations may be declared to one trick, provided the same card is not used twice over. Thus, a player having declared four kings, and holding two or three queens matching as to suit may, after winning another trick, marry them all at the same time. But, if a player holds king and queen of spades, and knave of diamonds, he must not put down the three cards to score marriage and bézique. He must first score one combination, say bézique; then, after winning another trick, he may place the king on the table and score marriage.

In declaring fresh combinations one or more cards of the fresh combination must proceed from the part of the hand held up. For instance: a player having sequence in trumps should first declare marriage in trumps, and then, having won another trick, he can declare the sequence by adding the sequence cards. If he incautiously shows the sequence first, he can not afterward score marriage of the king and queen on the table.

The same card can be declared more than once, provided the combination in which it afterward appears is of a different class. Thus: suppose spades are trumps, the queen of spades can be declared in marriage of trumps, in sequence, and in four queens; but a king or queen once married can not be married again, nor can a card having taken part in a set of four take part in another set of four, to make four aces, kings, queens, or knaves; nor can one bézique card be substituted for another to form a second single bézique.

Table of Bézique Scores.—Each seven of trumps, declared or exchanged, counts 10; king and queen of any suit (marriage), when declared, count 20; king and queen of trumps (royal marriage), when declared, count 40; queen of spades and knave of diamonds (called bézique), when declared, count 40; queen of spades and knave of diamonds, declared twice in one deal by the same player (called double bézique), count 500.

The above score is in addition to the forty, if, perhaps, already scored for single bézique.

In order to entitle to double bézique, all four cards must be on the table at the same time, and unplayed to a trick. If all four are declared together, only 500 can be scored, and not 540.

Any four aces, whether duplicates or not, when declared, count 100; any four kings, whether dupli-

cates or not, when declared, count 80; any four queens, whether duplicates or not, when declared, count 60; any four knaves, whether duplicates or not, when declared, count 40; sequence of best five trumps, when declared, counts 250. The best five trumps are ace, ten, king, queen, and knave. If a player has already declared a royal marriage (40 points) he can subsequently declare a trump sequence (250 points); but, if the sequence be declared first, it precludes the subsequent declaration of the royal marriage with the same cards. Each ace or ten taken or saved in trick counts ten. The winner of a trick containing an ace or ten at once adds ten to his score; if the trick consists of two aces or tens, or one of each, he adds twenty.

Sometimes aces and tens are not scored till the end of the hand. In this case, each time an ace or ten is played the winner of the trick takes up the cards on the table, and turns them face downward in front of himself; and when all the cards have been played, each player looks through his cards to ascertain how many aces and tens it contains. When near the end of the game, if scoring in this way, it occasionally happens that both sides can score out. This being so, some players deduct the number of aces and tens held by one from those held by the other, and only allow the majority of aces and tens to reckon. Other players, when near the end, count the aces and tens in their tricks at once if it makes them out. Thus: being 960, and having four aces and tens in the tricks, the player would at once call game. Others, again, give precedence in scoring aces and tens to the player who wins the last trick. But the best and simplest method is to mark each ace and ten as the score accrues, not only at the end, but all through the game, as is done in the case of other scores.

The winner of the last trick counts ten.

The Last Eight Tricks.—The last two cards of the stock are taken, one by each player, as before, the loser of the last trick taking the turn-up or seven, as the case may be. When the stock is exhausted no further declarations can be made. Then all cards on the table that have been exposed in declaring are taken up by the player to whom they belong, and the play of the last eight tricks commences. The winner of the previous trick now leads; the second player must follow suit if he can, and must win the trick if he can. If he holds a trump, and is not able to follow suit, he must win the trick by trumping. The winner of the trick leads to the next. The tricks are still only valuable for the aces and tens they may contain.

The winner of the last trick scores ten points.

Mode of Scoring.—A numbered dial with hand, or a bézique-board and pegs, or counters, may be used. The last plan is to be preferred. Eleven counters are required by each player, one marking 500, four each marking 100, one marking 50, and five each marking 10. The counters are placed to the left of the player, and when used to score are transferred to his right. This system of marking shows at a glance not only how many each player has scored, but, by looking to his left, how many he is playing for. This is often important when near the end of the game.

The game is usually played 1,000 up. If one player scores 1,000 before his adversary obtains 500, the game counts double. A *partie* is the best three games out of five, reckoning a double as two games.

Hints to Beginners.—The first difficulty in playing to the tricks is to decide what cards to throw away and what cards to retain, so as to do the least harm to your chance of scoring.

1. It is, if anything, disadvantageous to get the lead unless you have something to declare. Therefore, when a card (not an ace or a ten) is led, do not take it, but throw away a losing card. (See 5 and 12.)

2. The cards that can be spared without loss are sevens, eights, and nines, as they form no part of any of the scoring combinations. (But see 7.)

3. After these, the least injurious cards to part with

are knaves (except the bézique knave and the knave of trumps).

4. It is better, when in difficulties, to lead a ten or an ace, as a rule, than a king or queen, though there are many exceptions. Aces count a hundred, kings only eighty, and queens only sixty; but kings and queens can marry and aces can not. And, as a rule, if you play for four aces, you have to sacrifice some other combination, and having shown four aces, you are pretty sure to lose some of them in the tricks. Remember that every ace or ten lost to you makes a difference of twenty in the score.

5. It is seldom advisable to go for four aces unless you happen to hold three, and are in no difficulty. Rather make tricks with the aces when opportunity offers.

6. If driven to lead an ace or a ten, and your adversary does not take the trick, it is often good play to lead another next time.

7. Do not part with small trumps if it can be helped. The seven, eight, and nine of trumps should be kept to trump aces or tens led. If possible keep one small trump in hand to get the lead with when you want to declare.

8. Do not part with trump sequence cards. Even if you have a duplicate card of the trump sequence you should not play it until near the end of the hand, as playing it shows your opponent that you have a duplicate. This frees his hand, as he need no longer keep sequence cards. Armed with this knowledge, he will trump every ace and ten you subsequently lead.

9. Until near the end of the hand, do not part with bézique cards, even after declaring bézique. By so doing you give up all chance of double bézique, the score for which is very high. Having declared bézique, and holding or drawing another bézique card, sacrifice everything, even sequence cards if necessary, for the chance of double bézique.

10. Having a choice between playing a possible scoring card from your hand, or a small trump from your hand, or a card that you have declared, as a rule play the declared card, so as not to expose your hand.

11. Avoid showing your adversary, by what you declare, that he can not make the trump sequence or double bézique. By keeping him in the dark you hamper his game, and as a likely consequence may save some of your tens or aces from being taken by him. For example, (hearts being trumps) suppose early in the hand you hold four queens, viz., two queens of hearts and two queens of spades. It is much better to sacrifice, or, at all events, to postpone scoring, sixty, and not to declare these, than to let your adversary know that he can not make sequence or bézique. (Compare 8.)

12. Whenever your adversary leads a card (not the ace) of a suit of which you hold the ten, take the trick with the ten. This rule does not apply to trumps, as in that suit you require the ten to form part of your sequence.

13. When there are only two cards left in the stock, win the trick if possible. It is the last chance to declare, and it also prevents your adversary from declaring anything more that hand.

14. Toward the end of the hand run your eye over the cards your adversary has on the table, and play accordingly. For example: suppose your opponent has an ace on the table, and you hold a card of that suit, throw away that card that you may be able to trump the ace in the play of the last eight tricks.

15. In playing the last eight tricks your only object should be to save your aces or tens and to win those of the adversary.

16. It is of more importance to win aces and tens than at first sight appears. It is very captivating to sacrifice a number of small scores for the chance of obtaining a large one, and very agreeable when such play succeeds. But it is the practice of experienced players to make sure of a number of small scores. They say

that a player who habitually wins the most aces and tens will come off winner in the long run.

17. Endeavor to remember in what suits the aces and tens have been played; and, in leading small cards, choose those suits of which the most aces and tens are out. By this means you diminish your opponent's chance of making aces and tens.

18. Similarly, after your adversary has declared aces, avoid leading cards which he can win with those aces.

19. Again, in discarding small cards, retain those which are least likely to be taken by aces and tens.

20. By carefully watching your adversary's play you can judge to a great extent what cards he has in hand, and what combinations he is going for. Thus: if he declares a marriage, and discards the king, but retains the queen, he is probably going for queens; if he shows another marriage, and discards another king, the inference is strengthened. With attention and experience it is surprising how much may be inferred as to your adversary's game, and your own line of play is thereby materially directed.

Rules and Penalties of Bézique.—1. The highest deals. In cutting, the cards rank as in playing.

2. The players deal alternately throughout the game.

3. If the dealer gives his adversary or himself too few cards, the number must be completed from the stock. The non-dealer, not having looked at his cards, may, if he prefers it, have a fresh deal. (See also Rule 8.)

4. If the dealer gives his adversary too many cards, the player having too many must not draw until his number is reduced to seven. If the dealer gives himself too many cards, the non-dealer may draw the surplus cards, and add them to the stock. But if the dealer, having too many cards, looks at his hand, he is liable to Rule 9.

5. If a card is exposed in dealing, the adversary has the option of a fresh deal.

6. If a player draws out of his turn, and the adversary follows the draw, there is no penalty. If the adversary discovers the error before drawing he may add twenty to his score, or deduct twenty from that of the other player.

7. If the first player, when drawing, lifts two cards instead of one, the adversary may have them both turned face upward, and then choose which he will take. If the second player lifts two cards, the adversary has a right to see the one improperly lifted, and at the next draw the two cards are turned face upward, and the player not in fault may choose which he will take.

8. If a player plays with seven cards in his hand, the adversary may add twenty to his own score, or deduct twenty from that of the other player. On discovery of the error, the player with a card short must take two cards at his next draw instead of one.

9. If both players draw a second time before playing, there is no penalty. Each must play twice without drawing. But, if at any time during the play of the hand one player discovers the other to have nine cards, himself holding but eight, he may add 200 to his own score, or deduct 200 from that of the other player. The player having nine cards must play to the next trick without drawing.

10. If a player at two-handed bézique shows a card on the table in error, there is no penalty, as he can not possibly derive any benefit from exposing his hand.

11. If a player at three or four handed bézique shows a card on the table in error, he must leave it on the table, and he can not declare anything in combination with it.

12. If a player at two-handed bézique leads out of turn, there is no penalty. If the adversary follows, the error can not be rectified.

13. If a player at three or four handed bézique leads out of turn, he must leave the exposed card on the table, and he can not declare anything in combi-

nation with it. If all the players follow to a lead out of turn there is no penalty, and the error can not be rectified.

14. The cards played must not be searched.

15. If a player revokes in the last eight tricks, or does not win the card led, if able, all aces and tens in the last eight tricks are scored by the adversary.

16. An erroneous score, if proved, may be corrected at any time during the hand. An omission to score, if proved, can be rectified at any time during the hand.

Triple, or Three-Handed Bézique.—When playing three-handed bézique, three packs are employed, and all play against each other, as in three-handed euchre.

The dealer deals to his left, and the eldest hand has the lead. The players deal in rotation.

Triple bézique counts 1,500, and all the cards of triple bézique must be on the table at the same time. The game is usually 2,000 up.

In playing the last eight tricks, the third hand, if unable to follow suit, nor to win the trick by trumping, may play any card he pleases.

In other respects, the method of playing is the same as in the two-handed game.

Four-Handed Bézique.—When playing four-handed bézique, four packs of cards are employed. The players may all play against each other, or with partners. When playing with partners, the partners are cut for, two highest against two lowest, and sit opposite to each other, as when playing whist.

Triple bézique counts 1,500, and all the cards of triple bézique must be on the table at the same time, but the béziques may be declared from the hand of either partner. A player may declare when he or his partner takes a trick. In playing the last eight tricks, the winner of the previous trick plays with his left-hand opponent; these two play their cards against each other, and score the aces and tens, and then the other two similarly play their cards. The game is usually 2,000. One player scores for himself and partner.

Bézique Panache.—In the game so called, the four aces, four kings, four queens, four knaves, must be, in order to count, composed of spades, diamonds, hearts and clubs; thus an eighty of kings, composed of two kings of spades, one of hearts, and one of diamonds, does not form a combination; and, in like manner with queens and knaves. This game ought to be the object of special agreement.

Bézique without a Trump.—This is played as the ordinary game, except that no card is turned to make a trump, but the trump is decided by the first marriage which is declared. For example: you or your adversary declare a marriage in clubs, then clubs become trumps, and so on with the other suits.

The five highest trumps, or score of 250, can not be declared until after the first marriage has been declared. The seven of trumps in this game does not count ten points. The béziques, four kings, four queens, etc., are counted the same as in bézique when the trump is turned, and can be declared before the trump is determined. It is the same with the other cards which form combinations; their value remains the same as in the ordinary game of bézique.

Polish Bézique (sometimes called "Open Bézique," or "Fildniaki") differs in many particulars from the ordinary game. When a scoring card is played, the winner of the trick places its face upward before him (the same rule applies in the case of two scoring cards to a trick) forming rows of aces, kings, queens, knaves, and trump tens. These are called "open cards." Cards of the same denomination are placed overlapping one another lengthwise, from the player toward his opposite, to economize space. When a scoring card is placed among the open cards, all the sevens, eights, nines, and plain suit tens in the tricks are turned down. Open cards can not be played a second time, and can only be used in declaring. Whether so used or not they remain face upward on

the table until the end of the hand including the last eight tricks. A player can declare after winning a trick and before drawing again when the trick won contains one or more cards which, added to his open cards, complete any combination that scores. Every declaration must include a card played to the last trick won. Aces and tens must be scored as soon as won, and not at the end of the hand. The seven of trumps can be exchanged by the winner of the trick containing it; and if the turn-up card is one that can be used in declaring, it becomes an open card when exchanged. The seven of trumps, when not exchanged, is scored for by the player winning the trick containing it.

"Compound declarations" are allowed, that is, cards added to the open cards can be used at once (without waiting to win another trick), in as many combinations of different classes as they will form with the winner's open cards. Thus, suppose A has three open kings and wins a trick containing a king; before drawing again he places the fourth king with the other three and scores 80 for kings. This is a simple declaration. But if the card led was the open queen of trumps and A won it with the king, and he has the following named open cards: three kings three queens, and ace, ten, and knave of trumps, he at once declares royal marriage (40); four kings (80); four queens (80); and sequence (250), and he scores altogether 430.

Or, if ace of spades is turned up, and ace of hearts is led, the second player has two open aces and wins the ace of hearts with the seven of trumps, and exchanges. He scores 10 for the exchange, 10 for the ace of hearts, 10 for the ace of spades, adds the aces to his open cards, and scores 100 for aces—180 in all. If a declaration or part of a declaration is omitted, and the winner of the trick draws again, he can not amend his score.

A second declaration can not be made of a card already declared in the same class. For instance, a queen once married can not be married again, and a fifth king added to four already declared, does not entitle to another score for kings.

It must be kept in mind that no declaration can be effected by means of cards in hand. Thus B, having three open queens and a queen in hand, can not add his open cards to his hand. He must win another trick containing a queen when he can declare queens.

Declarations continue during the play of the last eight tricks exactly as during the play of the other cards.

The game is 2,000 up. It is desirable after each deal to shuffle thoroughly; otherwise, a number of small cards will run together in the stock and detract from the interest of the game. It is also well to follow the rules for ordinary bézique respecting changes of cards; otherwise, the scores of one may run very high and the other very low, thus impairing the interest of the game. The lead is even more disadvantageous than in common bézique. It is important not to lead anything that can be won by ordinary bézique cards. It is often desirable to win with a high card, though able to win with a low one; thus, having king and nine of a suit of which the eight is led, if you win the trick you should take it with the king. It is not so important to win aces and tens, especially the latter, as in ordinary bézique. A difficult point in the game is to decide whether to win tricks with sequence cards, on the chance of eventually scoring sequence, or to reserve trumps for the last eight tricks. As a rule, if the hand is well advanced, and you are badly off for trumps, win tricks with sequence cards, and especially if you have duplicate sequence cards make them both. If badly off in trumps toward the end of the hand, and your adversary may win double bézique, keep in hand an ace or ten of the bézique suits, since when it comes to the last eight tricks, where suit must be followed, you may prevent the score of double bézique.

Grand or Chinese Bézique.—This is played like ordi-

nary bézique, except that four packs are shuffled together and used as one, and nine cards are dealt to the players, three at a time to each. When a combination is declared and one of the cards composing it is played away, another declaration may be completed (after winning a trick) with the same cards. For instance, C declares four aces, and uses one to win a trick, or throws one away. He has a fifth ace in his hand, and wins a trick; he can add to it the three remaining declared aces and score four aces again, and so on. Marriages can be declared over and over again; thus king and queen of hearts are declared, and the player draws another king of hearts. He plays the declared king and wins the trick. He can then marry the queen again. This is sometimes objected to, on the ground of alleged bigamy, but if permitted only after the declared king is played—that is to say, removed from the sphere of active life—his queen may properly be regarded as a widow, free to marry again.

Bézique follows the same rule, if, for instance, a knave is played away, another knave makes another bézique, and so with double and triple bézique, if the former declared cards which remain unplayed can be matched from cards in hand to make the required combinations. Sequences can be declared over and over again, and compound declarations made among the declared cards are now generally allowed. The sevens of trumps do not count, nor does the last trick, unless by special agreement among the players. The game is 8,000 up. The points for the players to aim at are to declare four aces or sequence, which can then be declared over and over again, if fresh aces or sequence cards are taken into the hand (the duplicate sequence cards being first played away). With fair probability of sequence, everything else, including even aces or chance of double bézique, should be sacrificed.

BIBLE SOCIETIES. American.—The seventy-second annual meeting of the American Bible Society was held May 10. The Hon. E. L. Fancher presided. The cash receipts of the society for the year for general purposes had been \$557,340, in addition to which \$4,971 had been received to be permanently invested. The cash disbursements for general purposes had been \$506,453. The funds held in trust, of which only the income is available, amounted to \$347,721, and had yielded during the year \$13,662. The investments for general purposes amounted to \$204,561, and had returned an income of \$10,282. More than two hundred volumes had been added to the library, two thirds of the number being copies of the Scriptures in various languages, some of them representing work done in ancient times. Progress was reported on translations of the Scriptures into Spanish, Modern Syriac, popular Japanese, and Telugu. Preparatory to printing an edition in ancient Armenian, a committee of scholars in Constantinople had been invited to give counsel in respect to doubtful readings. The Muskokee version was under examination with reference to corrections for a new edition. Translations into the Indian languages of Mexico were desired, but could not be undertaken for the want of a competent translator. Progress had been made with the version for the Laos people. The question of a version into the easy Wenli of China was under advisement. Versions in other Chinese dialects were undergoing revision. The whole number of issues

during the year at home and in foreign countries had been 1,504,847 copies. In the missionary and benevolent work of the society, 387 Bible distributors were employed in foreign lands, and 126 colporteurs in the United States. The general re-supply of the United States, which had been in progress for six years, was now drawing to a close. So far, it had resulted in the visitation of 5,001,844 families, 607,009 of whom were found without the Scriptures; and the supply of 427,846 families and 243,764 individuals in addition. Amendments to the charter of the society had been procured, enlarging its powers to take and hold real estate by bequest or devise, which had previously been limited by the condition that the property be alienated within three years; and giving it authority to receive gifts and bequests in trust.

British and Foreign.—The annual meeting of the British and Foreign Bible Society was held in London, May 2. Lord Harrowby presided. The gross income of the society for the year had been £250,882, and the expenditure £224,828. As more than £100,000, however, of the total income was merely the price paid for the books sold, the net income had really been only £147,000. The whole number of Bibles and parts thereof issued had been 4,206,032, or 278,354 more than in the previous year. The money received was spent on foreign agencies, on auxiliaries abroad, and on kindred societies. The agents had charge of the depots, superintended the colporteurs, watched the passing through the press of the Bibles in the native languages of foreign countries, and sold the Scriptures—all with the object of promoting as far as possible the putting of the Bible into every man's hand. Speakers at the anniversary dwelt upon the benefits realized in missionary lands from furnishing converts with the Scriptures in their own tongues.

BOATS, COLLAPSABLE. Scientifically constructed boats capable of being folded or collapsed into comparatively small space are a modern invention. If we ignore the rude barbaric contrivances made of the inflated skin of animals and which were merely rafts or floats, it may fairly be said the existing type of folding boat came into being without passing through the usual protracted stages of development. The inventor is the Rev. E. L. Berthon, an English clergyman, and to him belongs the credit of having first conceived, and subsequently worked out the problem.

In June, 1849, the "Orion," a favorite passenger-steamer plying between Liverpool and Glasgow, ran upon a sunken rock off Port Patrick within two or three hundred yards of the shore. The accident was the result of inexcusable carelessness, as the weather was clear and the sea calm. The ship hung for a few minutes upon the rock, and then slid off into deep water, sinking at once and carrying with her about 200 persons of whom 150 were drowned. Only one of her boats was safely launched, and that was captured by the sailors and firemen. The

others were swamped by the rush of terrified passengers. Among the saved was a clergyman, a friend of Mr. Berthon, who wrote and published an account of his experiences. Knowing Mr. Berthon as a good draughtsman, he asked him to prepare some illustrations for the book, and while making the drawings the idea of a collapsable boat came into his mind.

Then followed the usual difficulties that beset inventors. For a quarter of a century he fought the battle single-handed. In his own words: "Nothing but faith and confidence in the invention which a higher power put into my mind, and a sense of certainty that some day it would prevail, carried me through. And now I am thankful to say that these boats are to be found in all parts of the world. They have been adopted by the Admiralty and by the India Board, and though, as hitherto, ship-owners stand off as being free from all responsibility with regard to the lives of their crews and passengers so long as they act up to a most defective law, I may confidently assert that the day is not far distant when this system of supplementary boats will be general."

The inventor's description of the boat is as follows: "Imagine a long melon cut into thin slices" (evidently the rind alone is meant). "their shape

end so as to lie flat side by side, like the leaves of a shut book, or to take any other positions radiating from a central line. Now if a certain number of such segments, properly placed at certain distances, are connected together by some flexible material on their outer edges, and made water-tight, the structure be-

comes a boat, but having as yet only one skin, it would only float so long as that skin is not pierced. But now let us suppose another skin to be applied to the inner edges of these lenticular segments and made water-tight, not merely is there a boat within a boat, but the spaces between the segments, being all separate and distinct, an injury to one does not affect the rest."

In fact the structure forms a true life-boat amply provided with water-tight compartments, and capable of anything that an ordinary boat can do, except that its canvas skin is more easily pierced than the wood or iron of which boats are usually constructed. So long as the Berthon boat is properly handled and kept in open water, she is as safe as any other boat of her size.

Fig. 1 is a sectional view of a boat folded and open as explained in the context. Fig. 2 shows a fully equipped boat at the davits with the temporary canvas covering partly removed to show the profile of the

lenticular segments heretofore described) which are hinged to the stem and stern posts. When collapsed these timbers fall down on either side of the keelson in vertical and parallel planes, and when opened they assume such positions as to form the skeleton of the boat, extending the two canvas skins as described.

Experiments were at first made with India-rubber, but while it served admirably when new it was found that it would not stand exposure to changes of climate, and this failure led the British Admiralty to condemn the boat as a failure. Years elapsed before they could be induced to reconsider their availability when covered with canvas. The canvas as now prepared is saturated with boiled oil and litharge, and in every ten pounds is dissolved one pound of yellow soap. This keeps the fabric soft and pliable, and at the same time increases its strength. Boats thus constructed have been in use for from four to eight years, and are to all appearance as serviceable as they ever were.

FIG. 2.—BERTHON FOLDING-BOAT. SHEER PLAN.

folded boat. One very important feature of these boats is that they open themselves automatically as soon as the weight comes on the falls. There is therefore nothing to be done but to swing the boat clear of the chain-wale and lower away. Of course the same difficulties in taking the water are present as in the case of ordinary boats.

The materials used in construction are mainly wood and canvas. The longitudinal timbers are preferably strips of American elm, steamed and bent in a mold, and riveted together with copper. The stem and stern posts are attached to the keelson, and on each side are four longitudinally curved timbers (A A A, Fig. 1) (the

In practical service these boats collapse into about one fifth of the space occupied by an ordinary boat. They may be laid one on top of another, stowed below decks, or, which is by far the best plan, lashed along outside the bulwarks as shown in Fig. 2. It is said that the frames are strong enough to sustain the full complement of passengers at the davits, but lowering a crowded boat into the water is extremely dangerous and, as with all boats, it is best to allow the crew only on board.

The Berthon boats are built of all sizes, from the light, single-handed canoe, easily folded and carried under the arm, to the large life-boat, 40 feet long by 13½ feet beam. Boats

of this latter size are in use in the British navy. They weigh about fifty-five hundred pounds, and collapse to 2½ feet. A wooden boat of like dimensions weighs more than twice as

the transatlantic passenger fleet, has thirty large boats, capable of carrying every soul on board under ordinary conditions. Sixteen of these are non-collapseable, ten are "Chambers's patent unsinkable, semi-collapseable boats," and four are Berthon boats.

The Chambers boats mentioned are shallow boats fitted with washboards, which increase the height of the sides and the consequent carrying capacity of the boat. They are stowed one on top of another, three occupying the space of an ordinary boat. When raised into position, the washboards lock themselves in place. These boats are provided with forty air-tight compartments, and the bottom is so arranged that it serves as a life-raft in case of accident. Under the seats are lockers for provisions, etc.

Another folding boat known as the Douglass model is largely used in this country. It is based on the Berthon principle in so far as concerns its folding longitudinal timbers, but it is much lighter, and is intended mainly for the use of sportsmen. It is not a life-boat, having only one skin, and no water-tight compartments.

With each boat stout curved transverse ribs are provided which are easily adjusted and sprung into place when the boat is expanded, keeping the whole structure firmly stretched. External strips of hard wood protect the canvas from wear and tear, and add to its strength. (See Fig. 3.) The seats and floorboards are seen folded in the illustration, with the stout ribs that keep the frame expanded when in use.

Still another type of folding boat collapses endwise like an accordion, the bent ribs pressing inward against one another toward the midship section. When expanded these boats are stiffened by a jointed or hinged timber fastened along the bottom for a keelson or backbone. In transportation these boats take

much. Such a boat will carry eight horses, and a heavy field-gun with its gunners, besides the regular crew of oarsmen. The boat is beached, broadside on, and one of her gunwales is lowered till it is nearly on a level with the bottom-boards. Then the horses are led off without difficulty, as they are generally very glad to step or jump over the gunwale for the sake of getting on shore. Of course, with such a freight as here specified, extra floorboards are necessary to guard against restive horses.

The importance of such boats for military and naval purposes, and for hunting and exploring expeditions, is self evident, but of far greater consequence is their use for life-saving on board our great passenger-steamers, as well as on the huge troop-ships used by European powers. These vessels often carry nearly or quite two thousand souls, and their full complement of non-collapseable boats is capable of carrying only about six hundred, even under the most favorable circumstances. With the great passenger-steamers the case is hardly any better. They all of them carry more of the ordinary type of boat than they are by law required to carry, but the supply is far short of the necessity, and lack of room prohibits the transportation of more boats. Probably it is not desirable that the use of ordinary boats by vessels either of the merchant service or of the navy should be altogether abandoned. A fair supply should always be at hand, but a supplementary supply of collapseable boats is a necessity, and should be required by law, now that their practical utility has been proved. It is satisfactory to notice that the great transatlantic steamship lines have anticipated legislative action in this respect, and all the best ships are now equipped with collapseable boats. The "City of New York," the latest accession to

FIG. 4.—OSGOOD FOLDING-BOAT.

up very little room, as it is possible to stow them in a bag or a box no bigger than a moderate-sized trunk. The one shown in Fig. 4 is known as the Osgood folding boat. The

box in which, with all its attachments, it is packed for transportation, measures thirty-eight inches by seventeen inches, by eighteen inches deep. The oars, paddles, etc., are jointed for ease of packing. The weight of a twelve-foot boat is from twenty-five to fifty pounds, according to the completeness of its equipment.

At the Glasgow International Exhibition in 1888, was exhibited the Shepard collapsible life-boat which has several distinctive features. (Fig. 5.) The transverse timbers work on

A, Sheer plan, collapsed. B, Cross-section, expanded and collapsed.

a swivel attached to the keelson. When the boat is expanded their upper ends lock to the inwales, and are firmly held in position. When stowed these ribs are turned, as shown by the dotted lines at A, so that they overlap one another in a plane nearly identical with that of the keelson and end posts. The other dotted lines show bottom-boards, etc. At B is represented the midship section as it appears when expanded and when folded.

These boats have been adopted by some of the transatlantic steamship lines.

BOLIVIA, an independent republic of South America. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1888 and 1886).

Government.—The President of the republic is Don Aniceto Arce, whose term of office will expire on Aug. 1, 1892. His Cabinet is composed of the following ministers: Foreign Affairs, Señor Velarde; Finances and Interior, Don Telmo Ichazo; War, General Cabrera. Bolivia is not represented by a minister at Washington, nor are the United States at present represented at La Paz, except by Samuel S. Carlisle, American Consul-General. The Bolivian Consul-General at New York is Don Melchor Obarrio.

Army.—The strength of the regular army is 3,031 rank and file, the number of officers being 367.

Finances.—The foreign debt has been reduced to \$826,000, \$2,280,000 having been paid during the past four years in settlement of Chili's claims arising from the war on the Pacific. The home debt amounts to \$2,500,000. The budget for 1887-'88 estimates the income at \$3,665,790, and the outlay at \$4,599,225. In

order to increase the revenue it is proposed to raise the duties and the liquor-tax and the tax on patents. The exportation of national coin will continue to be prohibited until apprehensions of a monetary crisis shall be allayed. The by-laws of the new "Banco de la Paz" have been approved. Congress had voted \$10,000 toward defraying Bolivia's representation at the Paris Exhibition of 1889, but the Government finding that the amount would not suffice to do so with dignity, a bill increasing it has been submitted. The sum of \$300,000 has been voted toward additional mint machinery at Potosi.

Treaties.—An understanding has been arrived at between Bolivia and the Argentine Republic, fixing the boundary between them in the Chaco in a preliminary manner; a commission was to convene in November to determine the frontier line definitively. Negotiations with Brazil about a treaty of commerce, amity, and navigation were still pending; it will embrace an understanding facilitating the Madeira Mamóné Railroad scheme. The treaty of commerce with Peru is to be revised and completed; the boundary treaty with Paraguay is to become a subject of negotiations without further delay. Bolivia has engaged to send delegates to the Congress about to meet at Montevideo for the purpose of laying down rules for private international rights. A treaty of commerce and amity mutually guaranteeing literary and artistic right has been concluded with France and signed.

Railroads.—An English company has been formed in London for the purpose of building a line of railway from Arica to Bolivia in conjunction with the present owners and shareholders of the Arica and Tacna Railroad, with a capital of £2,000,000. The parties chiefly interested in this new enterprise are Messrs. Clark Brothers, who have built railways in the Argentine Republic, Richard Campbell, the Australian Bank in London, and Mr. John Meiggs. The new line is to reach La Paz *via* Tacna and Corocoro. The Huanchaca Company has resolved to build, with its own funds and without interest guarantee, a railroad and telegraph line from Oruro to the Bolivian frontier.

Telegraphs.—A new telegraph line is in course of construction between Tupiza and Tariza. As it will be connected with the Huanchaca Mining Company's private line, it will insure rapid communication with Mallendo and Europe. The project of an international telegraph bureau has, therefore, been submitted to Congress by the Government.

Public Works.—In July Don Cristian Suarez Arana arrived at Puerto Pacheco after having accomplished the junction between the road that leads from Isozog to Las Salinas and the wagon-road opened in that direction from Puerto Pacheco, thus establishing direct communication with the Paraguay river. The two departments more directly benefited are Chu-

quisaca and Santa Cruz. The settlements of agriculturists in the Chaco will be greatly benefited by this, as it will have a tendency to attract immigration toward this region, one of the most fertile of South America. In the Bolivian mining regions new wagon-roads have also been authorized by Congress.

Electric Light.—Not only is La Paz to be traversed by tramway-lines, but the electric light has been universally introduced.

Exploring Expedition.—In January Baron de la Rivière arrived at Chichilaya, Bolivia, after having passed nearly a year on the Tipuani river, an affluent of the Mapiari. He had been on a gold-hunting expedition among the districts which gave the ancient Peruvians all their gold. The baron speaks highly of the abundance of gold, but declares the climate to be of the worst description, and the region to be infested with vermin and deadly animals. He started into the forests with over two hundred men. Of this number only a very few have returned with him. The others succumbed to fevers, snake bites, and like evils.

Cinchona-bark.—The shipments abroad of Bolivian cinchona-bark have been steadily on the increase in 1888, not only cultivated but wild grown, thus more than compensating for the falling off from the island of Ceylon, which latter exported from October 1 to September 20, 11,632, 251 pounds, as compared with 13,921,109 in 1886-'87, and 15,226,152 in 1885-'86. The cultivated Bolivian bark has, in 1888, been exported not only in flat pieces, but also in the shape of tubes, and is still highly esteemed on account of its large quinine contents. Meanwhile, Peruvian cinchona planters assert that, at ruling prices abroad, their industry has ceased to be profitable; but, as stated, this does not deter them from exporting more than ever. A recent report by a gentleman named Van Lon, who resides in Batavia, indicates that there is likely to be a further heavy increase in the production of Java, not only on account of the enlarged acreage of trees that has been planted, but because it is found that the new growth is capable of producing bark that will yield 18 per cent. of alkaloid. It is stated that there are 12,000 acres under cultivation in Java, which, at 800 trees per acre, would give about 10,000,000 trees, which, at $1\frac{1}{4}$ pound a tree (the Indian average), would yield 15,000,000 pounds, spread over six years. While the supply from Bolivia and Java thus promises to be abundant enough, the Government of India has published for the information of the public, through the Bulletin of the Royal Gardens, Kew, some particulars of the new process of extracting quinine from the cinchona-bark by means of oil. By the aid of this process, perfected lately by Mr. Gamme, it is found possible to utilize the calisaya or yellow bark variety, and to extract from it the whole of its quinine in a form indistinguishable chemically or physically from the best brands of Euro-

pean manufacture, and this so cheaply that not merely in times like the present of depressed markets, but at all periods, it will not cost the Government more than twenty-five rupees per pound. Should all the expectations which this important discovery has awakened be realized, it is believed that it will lead to the substitution of Indian-manufactured quinine for the febrifuge in the hospitals and dispensaries of India, and, as a necessary consequence, to the substitution of yellow bark for red bark in the Sikkim plantations.

Indian Troubles.—In May another rising of Indians occurred in the province of Sicasica, some eight thousand of them being in arms, and threatening to massacre all the whites. They were commanded by a chief of the name of Vilca; but the cavalry garrisoned at Ayoayo was hurried on to suppress the revolt, which was quelled and the ringleaders imprisoned.

River Navigation.—The Bolivian Government has granted to Mr. John L. Thorndike the exclusive privilege for ten years of steam navigation between the Desaguadero river and Lake Poopó, all material which he will require for his enterprise to be admitted duty free. Since the Peruvian Government has seized the railroads of the Mollendo-Arequipa-Puno lines of Peru their administration has become so bad that Bolivian merchants who had been availing themselves of these lines in connection with Lake Titicaca for the transportation of their goods, have been compelled to return to the Arica-Tacna outlet, and this in spite of the fact that from Tacna the goods have to be forwarded on mules' backs, and that at Arica the goods have to pay storage and harbor expenses, which are not charged at Mollendo. While this is the case, the Bolivian Government has ordered the organization of custom-houses at the Mollendo Agency, at Puerto Perez or La Paz and the remaining ports of Lake Titicaca, in conformity with an understanding arrived at with Peru, and in conformity with the law of July 16, 1885, regulating the general customs' service.

Bolivia at the Barcelona Exhibition.—The Huanachaca Mining Company has made a magnificent display of its rich copper ores and blende, and the Bolivian firm of Artola Brothers, of Bolivian embroideries, textile fabrics, seeds, feathers, skins, chocolate, and small figures of whites and Indians dressed in the costumes of the country, together with a thousand curiosities, all together giving a high idea of Bolivia's resources and its manual and artistic skill highly creditable to the South American inland republic.

BORNEO, the largest of the Malaysian islands, having a length of 850 miles and a breadth of 600 miles. Its area is about 270,000 square miles. The Dutch claim suzerain rights over the greater part of the island, comprising the entire region south of the native state of Sarawak, which has long been administered by Englishmen, and the territory be-

longing to the Sultan of Sulu. In 1881 the British North Borneo Company was chartered in England, and took possession of the northern end of the island, by virtue of a grant from the Sultan of Sulu. Commercial stations were established, and a civil administration was organized by 1883, when the revenue collected amounted to \$50,738, while the expenditure amounted to five times that sum. The area of British North Borneo, as the new state was called, is 31,106 square miles. Its population is 150,000. The principal products are beeswax, edible birds'-nests, camphor, cocoanuts, coffee, dammar, fruits, salt fish, gutta-percha, hides, India-rubber, elephants' tusks, cattle, pepper, rattans, rice, sago, seeds, pearls, sharks' fins, tortoise and other shells, tobacco, trepang, cedar, and many kinds of cabinet-woods. The imports increased from \$429,000 in 1883 to \$535,000 in 1887, and the exports from \$159,000 to \$535,000. The climate is temperate, and agricultural colonies have been founded, the sales of land up to the end of 1887 having been 120,000 acres. There are plantations of sugar, coffee, pepper, and other tropical products. The soil has been found to be remarkably good for tobacco-culture, and, in the first three months of 1888, applications were made for 158,385 acres more. Borneo tobacco now competes successfully with that grown in Sumatra. There are five companies engaged in planting tobacco. The revenue now exceeds the expenditures, not reckoning the proceeds of land sales, which are treated as capital. The revenue is derived from duties on opium, salt, tobacco, and spirits, export duties, fees, and rents. Stations were first founded at Sandakam, Papar, Kiminas, Gaya, Kudat, and Silam, on the coast, and, as soon as land was cleared at those points, immigrants began to arrive, and the Dyaks of the interior brought in their produce to sell. A police force was recruited from Malays and Dyaks, Sulu Islanders, Nubians and Somalis from Africa, and Sikhs from India. Tribal feuds and head-hunting forays are now of rare occurrence. In 1884 the territory was enlarged by the additional grant of Dent Land in the south. The country enjoys the advantages of settled government under a system of laws copied from the code of India. There are offices, barracks, hospitals, jails, and wharves at all the stations. Explorations recently made in the interior have resulted in the discovery of alluvial gold in paying quantities on the Segama river, and of coal-beds in the southern province, but only the agricultural wealth of the country has thus far been developed. The forests produce some of the finest woods that are known, among them the valuable bilian-tree, and there is already a considerable export of timber to China. The British Government in the beginning refused to extend political protection to the North Borneo Company, as there was at that time a prejudice against the annexation of new

countries. New possessions have since been added to the British Empire in many parts of the world, and the Government has at length decided to declare a protectorate over British North Borneo, Sarawak, and the large native state of Brunei.

BOXING. Individual prowess is a large factor in the survival of the fittest. Man is no exception. From the beginning the praises of the man of speed, of muscle, of skill in the use of nature's weapons have been sculptured and sung. To acquire physical superiority has been the study of ages. The ancients paid great honor to the runner, the dumb-bell lifter, or any other specialist; but they outdid themselves when it came to the winner of the *pancratium*, a combination of boxing and wrestling, kicking, biting, gouging, and choking, beside which the contests of the modern prize-ring under what are known as the London rules are a parlor amusement.

To become a clever boxer is now the study of many people who a few years ago would have considered it degrading to be seen in the street with a pugilist. Books on this subject are being rapidly placed on the market, and schools of self-defense are opening all over the country. To be a fairly good boxer is soon to be a requisite in more than one occupation. The police of at least one American city (Pittsburg) are being instructed in the art of boxing at the expense of the tax-payers, and it is expected that when the force is composed entirely of proficient boxers the use of the club and pistol will almost entirely cease.

Boxing as it is now known, outside of those old-time brutalities with the cestus (a sort of brass knuckles), is about three hundred years old. It came into prominence first in England. The old English idea of boxing—to call it an art as it was then seems ludicrous—was but little better than that of the ancient Greeks and Romans. In olden times in England two so-called boxers entered a ring to settle the question which had the greater brute strength, courage, wind, and endurance. There was not the slightest question of brains in the battle. Soon a man came forward who was able by a show of agility to make up for his lack of size in a fight with one of these old-time giants; and then came a fighter like Tom Crib, who introduced the famous "milling on the retreat" tactics, and it became possible for a man like Tom Spring, who was not much more than medium sized (a middle-weight) and, a few years afterward, for Tom Sayers, almost a small man, to beat all the heavy-weights in England and hold the championship belt. When such results became possible, boxing might be said to have really become a science.

Since the time when only giants could be victorious pugilists this science has undergone more than one revolution. Once the two fighters stood toe to toe, and to retreat, to go down, to manoeuvre in any way, was disgraceful. Once men used the left hand as a shield

and the right as a mace. Then the right hand became the shield and the left the weapon of offense. In the time of Heenan and Sayers, the English fighters depended mainly upon the right; but Heenan showed them the superiority of the left. For years it was said that only a "yokel" hit with his right fist, or struck a swinging blow. John L. Sullivan, the mightiest pugilist of the age, who brought the business of pugilism from the gutter to a profession almost as well-paying as base-ball-playing or riding running horses, revolutionized all that, developed the blow on the point of the jaw, and with swinging, round-arm blows of his terrible right, incased though it was in a boxing-glove, mowed down opponents who trusted to their knowledge and practice of boxing to defeat him. Possibly some of Sullivan's triumphs are explained by the facts that he came out at a time when pugilism was at a low ebb and good big men were scarce, and that he met his opponents under Marquis of Queensberry rules instead of under the rules of the London Prize-Ring, which would have suited many of them far better. Sullivan's battle with Charles Mitchell, under the London rules, in France, in March, 1888, resulted in a draw after a protracted encounter. A man, Sullivan's inferior in weight by forty pounds, facing him in a bare-knuckle fight for hours, has done much to change the popular idea of scientific boxing. A few years ago it was all right-hand swinging blows, and decisive battles in very short time; now it is more caution, more careful hitting, and mostly with the left hand, the right being saved, as before Sullivan's advent, for the *coup de grâce*. Sullivan took boxing to one extreme, to win or lose in short order by one decisive hit on a tender spot, the point of the jaw. Mitchell has turned back the tide by his long, waiting tactics; while another man, Jack Dempsey, the wonderful middle-weight, has been a sort of balance-wheel.

Even before the idea had been broached of using the legs in a prize-fight, or the rules allowed it, there was some knowledge of the most vulnerable spots for blows. The pit of the stomach, called "the mark," was one of these, and a severe blow on this spot was very telling. Other points of attack were the butt of the ear or on the jugular vein; the temples, the eyes, the throat, just over the heart, and on the short ribs. The extreme sensitiveness of the point of the jaw and the chin was left for John L. Sullivan to demonstrate. The "big fellow," as his admirers delighted to call him, while sitting in a surgeon's chair having the arm that he broke over Patsy Cardiff's head reset, told the writer of this article that he discovered his famous "knock-out" blow partly by accident and partly from reading the works of a famous English novelist. Sullivan said he knocked men out of time in the beginning of his career by delivering a swinging right-hand blow on

the neck on the jugular vein. But he soon found the full-arm swinging blow as dangerous to his own hand and forearm as to his opponent's circulation, so he changed the full-arm swing to a half-arm one, and tried to deliver the blow on the jaw-bone instead of on the neck, as it was equally effective and less likely to be fatal. However little future boxers may value Sullivan's round-arm delivery, they can not fail to give him credit for centralizing his fire and for pointing out a supremely vulnerable spot.

Preliminary Points.—Gentlemen want to learn, not the tricks of the ring, but the simple points of scientific pugilism. The first thing in boxing is to learn to double the fist correctly, "make up a bunch of five," as it is called in ring-parlance. Not one man in a thousand can do this, not because there is anything difficult about it, but because so few will make the attempt naturally. A novice is sure to protrude the middle, or second finger, thinking he is making a very formidable weapon of his hand, when in reality he is only increasing his chances for that curse of boxing—broken hand-bones. At best, ninety-nine amateurs in a hundred double up the fist squarely, that is, with the first and second fingers closed tightly and the third and fourth loosely folded. This makes another ugly-looking but very ineffective weapon, sure to be injured at the first good blow. To double the fist correctly, open out all the fingers and the thumb to the widest stretch, then close naturally. The backs of the big knuckles, the only ones that should ever strike on an opponent, will be found to have formed an arch when the hand is tightly closed. In fighting or boxing the hands should be held loosely, half open, all the muscles and those of the forearms relaxed, till the moment of delivery, when the fist should be most tightly closed. No one can practice throwing a base-ball without learning how thoroughly interdependent the muscles are. The wisdom of resting the hands by giving them perfect freedom while not actually delivering a blow has been illustrated by many great boxers. Those masters, Jem Mace and Joe Coburn, always manœuvred in the ring with hands as open as if they were about to wrestle, not to strike with the fists. Indeed, the wonderful Gypsy's commonest trick in a ring was hitching up his waist-band, wiping his hands on his fighting-breeches, or rubbing them together. Dominick McCaffrey, in his easy forty-minute victory over Golden, in their skin-tight glove contest, was doing with his hands a great deal of the time the practice that a school-girl does with her fingers in order to be able to stretch an octave. Jem Carney, in the light-weight championship battle with Jack McAuliffe, used the same method of keeping his hands fit for their work. For boxing-practice with ordinary gloves the hands do not need the hardening the pugilists give theirs before a matched battle; but no blow

in boxing should be delivered with the hand or glove open. A light blow should be given in showing a friend a move, not by slapping, tapping, or "flicking," but by accurate gauging of the time and distance. When an amateur can deliver a light blow with a closed hand delicately, he is becoming artistic. They say that Mace could knock down an ox or simply touch the powder on a lady's face with a blow from his clinched hand. The story may have just a flavor of the trip-hammer-and-watch-crystal tale about it, but Mace certainly was a wonderful artist. Pugilists harden their hands in different ways. The change from the bare-knuckle fighting of olden times to the dog-skin-glove battles of recent years does away with much disagreeable and tiresome work in this direction. Good, hard rubbing is one of the best things in the world to harden the flesh and bones of the hand. Alcohol, lemon-juice, rock-salt, gunpowder, saltpeter dilute, tannin, and alum are some of the washes used. Jem Carney, the English light-weight champion, used to whet his hands over a smooth plank for hours a day during his training, slapping the backs of his hands back and forth over the wood as a man straps a razor. As, in spite of all precaution, a carelessly delivered upper-cut, a blow on an opponent's head, or a failure when very tired to have the hands as well closed as they should be, is always liable to injure the hand, it might not be out of the way to mention a simple remedy, of which few surgeons are apt to think. It will do away with what most fighters' hands have, unsightly bunches from the broken bones not having been properly set. A silver dollar inserted under the bandage over the broken bone will press the ends in together so tightly as to heal them most completely and without a bunch. A wooden dollar would answer just as well.

How to Stand.—A good position in boxing is very important. The approved position is with the body erect, weight between the legs, the left being advanced in front of the right. The toes of the left foot are turned *in*, those of the right foot *out*. The rule among the cleverest of the professionals is "On the flat of the left; on the ball of the right." The right leg need *not* be behind the other in a line running from the heel of the right foot through the ball to the heel of the left, as has sometimes been taught. It would require a tight-rope walker's balancing powers to stand with one foot exactly behind the other in delivering a blow, though the right will greatly second the effort if it is pretty nearly behind the left. The right leg should be slightly bent at the knee, the left held straight but not stiff. Just how far apart the feet should be kept, is another matter of individual practice, influenced also by each one's height and build. The most convenient distance between the feet is generally about half the ordinary step. It would tire anybody but a statue to keep

this or any one position long, and the muscles of the legs and body are rested by stepping about. In walking about an attempt should be made to keep the left foot a little in advance of the right, and be ready to fly into the attitude in no time. Proficiency in leg-work, which is most important, can only be acquired by long practice and natural aptitude. Some boxing-teachers tell pupils to stand with the left or advanced foot turned *out*. This is contrary to the whole theory and practice of boxing, which simply tries to make the most of nature's laws in every instance. The very important thing about a position is the advantage it gives to get quickly backward or forward and to second the delivery of blows. Let any one when standing perfectly still with his left foot advanced and the toes turned well *out*, try to spring backward or forward; then try it with the toes turned *in*. All pedestrians, sprinters, six-day runners, and heel-and-toe walkers progress with feet either held perfectly straight or with the toes turned a trifle *in*. The child of nature, the American Indian, travels in the same way, and so do most mail-carriers and policemen.

The variety of positions in which to do good and effective boxing is as great as is the number of boxers. Every man selects that attitude best suited to his height, reach, length of leg, and tactics. To stand well up, so as to take full advantage of the height, is generally considered wise, some men even standing on the toes. This is seemingly a very tiresome attitude, yet it is one that Tom Sayers frequently assumed. A man's position, however, must be governed by other considerations than a sole wish to stand as tall as possible. Any one that has ever tried to hit a punching-bag knows that force is gained for the blows, even if speed is lost, by assuming a stooping attitude.

The Arms.—The left arm should be held out perhaps a little farther than elbow-distance from the body, with the hand held so that the thumb is uppermost. The left arm in position should form an obtuse angle. The right arm should be thrown across the body, with the hand held in the neighborhood of the left nipple, or over the pit of the stomach, as individual practice finds it more effectual to hold a high or a low guard. Holding a low guard renders "stopping" less speedy, but "cross countering" more forcible. The right arm, if held for a high guard, should form an acute angle; if for a low guard, a right angle. The elbow, it is now determined, should be held close to the body. There are no prominent pugilists who now attempt guarding with the elbow to any extent. As with the legs, the arms are not held rigidly in their positions. In fact, some of the most successful boxers seldom stand on guard as they are pictured. The right hand should not be too strictly confined to the position described, but it can not be allowed as much latitude as the left, which is the offensive member. The right is at once the buckler and the reserve force of the body. Its duties are to

"stop" the incoming left of an opponent, or to "cross-counter" his deliveries.

Why the left and not the right foot and arm are advanced in scientific boxing, is the first thing that a beginner, who always wants to stand right foot and right hand foremost, asks to know. The left arm, side, and leg are held in front of the right for two reasons. First, an opportunity is given by bringing the left arm out in advance of the right to inflict punishment as well as to guard it. The only use that a novice makes of his left is to guard with it, using his right entirely for offensive work. The left is not in general use as the right hand is, and but for this getting it into a position where a little blow, and a half-pushing blow at that, from it tells, no amount of practice could enable a man to do much with it. It takes a left-handed man to throw a stone well with the left hand, and he can not use his right. No right-handed man can hit in the same manner with his left that he can with his right. But with practice he can hit a good left-handed blow in a little different manner. Think of the amount of practice it takes for a person used to driving a nail with the right hand to become able to drive the nail with the hammer held in his left hand! But with a hammer-head only, and with a different kind of blow, he can drive a nail with the left hand quite well.

The holding of the left arm and leg in advance of the right is a wonderfully clever yet simple way of making boxers ambidextrous. The plan does not render the left as handy as the right, but it enables it to hit a different kind of blow, which is almost if not quite as effective as the sledge-hammer smash of the right. The second reason is, that the right, the most accomplished hand, is made to do guard and reserve if not skirmish duty. It is always more important to defend than to offend, and at the same time the right is "stopping" an opponent's blows, its hitting strength is being kept in reserve for a heavy blow on jaw or ribs when the opportunity comes.

To Hit, and not be Hit.—To learn hitting out, stand up before an eight or ten pound punching-bag in the attitude described; draw the left arm and shoulder back so that the arm forms a slightly acute angle with the fist or gloved hand opposite the side or short ribs and the left shoulder twisted back, the right shoulder, of course, coming forward in accommodation and the right fist or glove moving from its position over the mark or the left nipple up almost upon the left shoulder. The bag should always be used to learn hitting, as a beginner feels more confidence than in practicing on an opponent. When drawn or twisted back as far as possible without straining clinch the left hand as tightly as possible, and suddenly shoot it forward, or "lead" at the bag as hard as possible, helping the force of the blow by drawing back the right arm and right side of the body and stepping in with the left foot. In delivering the blow, be sure

to have the hand in a natural position—that is, with the thumb on top, not on the outside of the closed fist. Strike forward as far and as straight as possible. The bag, if light, should be swinging freely, and it should be struck, "met," as it is coming toward the hitter. A heavy bag should never be hit except when it is swinging from the striker. The left-hand blow is not hit as the blow with the right is, but is a sort of quick, half-push—a "jab" or a "prop" it is called in ring-parlance. No blows with the right hand should be struck during the early practice, but every effort should be made to acquire dexterity, force, and speed in delivery with the left. It is not the few hard hits with this hand that tell so much as the many light blows for which no return blow or counter is taken. After some confidence has been acquired by bag-work, practice with an opponent should be begun. Always try to land the blows squarely on his face or body. To "stop" an opponent's blows and never to get hit, is even more important than effective hitting. It tires more to strike than to stop; therefore, if two men were to meet, one of whom was a perfect stopper though he could hit scarcely at all, and the other could not "stop" blows, the good stopper would win. Very few of the present-day boxers excel as stoppers. None can come near the excellence of that wonderful ex-champion of the light-weights, Billy Edwards, who in his day worsted all who came before him, regardless of difference in size and weight. To stop well requires much practice and good hard work with as many different kinds of hitters as possible. As the left-hand blow of an opponent is coming in for the face, the right, which has been lying across the breast, should be suddenly raised, the palm turning outward as it meets the incoming punch. The blow should be stopped in such a way as to have the forearm or wrist of the striker land on the tightened muscles of the forearm of the stopper. It is hard to clinch the hand too tightly or "stop" too forcibly. A few good hard stops will sometimes so hurt an adversary's arm as to render him most cautious about "leading." Do not attempt to throw off the blow; the best way is merely to stop it. Always keep the right elbow as low, near the ribs, as possible.

There is a left-hand lead for the body as well as for the head. The point of attack on the body is the pit of the stomach or "mark." To hit the "mark" effectively, the hand should be turned so that the back or large knuckles are on top and the thumb on the inside. The weight should greatly assist this blow. The stop or guard for the body lead is with the right, but struck downward instead of upward. Much stopping is very trying to the arms. Tom Sayers's right forearm was as much injured as if it were broken, if it was not broken, in the battle with John C. Heenan, stopping the Troy giant's terrific left-handers. Few fighters emerge from a battle without forearms black

and blue from wrist to elbow from stopping their opponents' blows.

Dodging and Countering.—As a rest and as one of the easiest ways of inculcating use of the straight counter the teacher of one of the best boxing-schools in this country always takes up the "slipping" or dodging of the left-hand lead as soon as his pupils can show fair proficiency in hitting and stopping. Dodging and countering the left lead is performed by throwing the face suddenly toward the right shoulder as the left lead is about to land on nose, mouth, or eye, the head being at the same time dodged slightly forward and a little toward the right, the left hand being simultaneously sent in on the opponent's face. The beauty of this blow is its ease of delivery and the combination of muscles which aid its force. A boxer can hardly be so tired that he can not use this method of punishing an opponent, and in many a prolonged contest has it secured the victory. Variety may be given this manœuvre by occasionally making the counter do on an opponent's body.

The greatest exercise movements in boxing are the straight counters. The straight or left-hand counters are made on face and body just as the left leads are, only, instead of the blows being made when an opponent is on guard, they are delivered in response to his leads. To straight counter: The moment an opponent leads, stop his left with the right, and simultaneously, or a fraction of a second later, as individual practice finds best, let go the left forcibly on face or body.

As almost everybody is so much in need of left-hand development and practice, the best boxing-teachers instruct in the feints with the left in an effort to make the left the offensive one before any attempt is made to teach the offensive use of the right hand.

A feint is a make-believe. It may consist of a pronounced false movement with the fist or glove, but a scowl, a clinching of the teeth, a stamp of the foot might serve. A clever feinter so manages it that he gets an opponent nervous—"rattled"—off his balance—with arms in a position impossible to be serviceable in guarding, while he himself is drawn back in a perfect attitude for a tremendous blow which he lets go at exactly the right moment. Feints may be made with the left for the face followed by a blow for the features, or on the body followed by a body-punch, or a body-feint may be followed by a face-blow or *vice versa*. A left-hand feint may be followed with a blow of the right hand or the opposite, or a half-dozen feints may be made before any real attempt is made to plant a hit.

The Right Hand.—Not till familiarity with the use of the left has been acquired should any effort be made at right-hand delivery. The great right-hand blow is called the cross-counter. All but direct right-hand leads, and they are very seldom made by experts, are modifications or complications of the cross-counter

principle. John L. Sullivan's early work was successfully done by the full-arm swinging cross-counter, which he modified, after a few broken hands, to a half-arm swinging blow. There are two good ways of striking the cross-counter. One way, the first to be described, has the advantage in speed and handiness of delivery, but the second method is considered the safer. That is, there is less danger of being severely countered in return.

When boxing with an opponent for practice, have him lead with the left for the face. Instead of stopping the blow with the right forearm, as before treated, or dodging it by throwing the face toward the right shoulder, throw the face just a trifle toward the left shoulder and, without turning so much as to take the eye from the hitter's face, rise as much as possible on the ball of the right foot, and try to hit him with the right on the jaw, or on the neck close under the ear, by throwing the right hand and arm over, "*across*" the incoming left, which should slide harmlessly over the cross-counterer's right shoulder. A little practice will show just how to turn the hand slightly so as to land on the jaw or neck with the clinched knuckles of the third and fourth fingers. This is one of the prettiest, most scientific, and severest punishing blows in the whole science of boxing. The cross-counter may be guarded by throwing the right hand up to the base of the ear, catching the counter in the palm and throwing it off. It may also be avoided by ducking. To duck the cross-counter, throw the head straight down as the blow is near its destination, and bring it up on the outside of the blow, which, of course, has just missed. Perhaps the best way is to dodge it. In dodging turn the face to the right as the left lead is delivered; this will present the back of the head for the receipt of the cross-counter, and make an opponent liable to break his hand. Variety is sometimes given to the cross-counter by aiming at the short ribs instead of the jaw. This is called the low cross-counter. To strike the old fashioned or safe cross-counter, dodge the left lead as if to make the dodge and left counter, but come up quickly close beside the antagonist and deliver the right like lightning on jaw or neck. It should always be remembered that landing a good straight left-hand blow on an opponent's nose or chin will prevent his effectively "*crossing*" that blow at least. Another stop for the cross-counter, especially when an opponent is much addicted to its use, is to land a few solid left-handers on his right shoulder. This will temporarily paralyze his right delivery.

Ultra-Scientific Work.—Good head-work generalship and ducking and dodging are very essential; ability to manœuvre the feet is, if anything, more important. Only long practice will tell an individual how much ducking he can do with safety, and it is best to rely on ducking only as a resort in a tight pinch. Properly balanced on the feet, and well practiced in getting

backward or forward and breaking ground to the side, is generally easier and safer than ducking in close quarters, which frequently compels one to lose sight of his opponent.

A boxer who battles on the defensive, depending only on straight counters or the old-fashioned cross-counters, a good stopper and ducker, and well up in leg-work, will bother a much heavier man, no matter how expert.

As the Marquis of Queensberry's rules for boxing-matches are understood in this country, there is very little chance for an in-fighter, but it is one of the great things in boxing. Especially is in-fighting valuable in an unexpected encounter. The principal point about in-fighting is to keep both hands at work. In an unexpected fracas let the opponent do all the hugging and struggling; keep the left going straight in his face and at the body-mark, and half swing the right on neck, jaw, and short ribs.

A very expert blow which few, even of the professionals, have mastered, is the draw and counter for the cross-counter. The enemy's fire, the right cross-counter, is drawn by a clever feint with the left. His cross-counter is stopped with the left, and the movement of the body, which aids in stopping his right with the left, helps in sending a tremendous right into his jaw.

Another clever move is the inside right. Few of the most expert use it, but it is a very effective blow. The inside right is used instead of the cross-counter by stopping a left lead with the right, making the movement of body for the stop aid in getting the right into position and delivering a counter with it on the jaw, but inside instead of outside and across the arm that led.

Upper cutting is sometimes effective, but is always so dangerous to whomsoever attempts it that many boxers do not attempt it at all. The upper cut is a counter. It should only be used after careful illustration by a good teacher. The blow should never be employed except when an opponent comes in head down.

BRAZIL. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia," for 1884.)

Government.—The Emperor is Dom Pedro II, born Dec. 2, 1825. He returned from Europe on August 23 with his health restored. His Cabinet is composed of the following ministers: President of the Council of Ministers and Minister of Finance, Senator João Alfredo Correa d'Oliveira; Minister of the Interior, Deputy José Fernandes da Costa Pereira, Jr.; Minister of Justice, Deputy Dr. Antonio Ferreira Vianna; Minister of Foreign Affairs, Senator Antonio da Silva Prado; Navy, Senator Luiz Antonio Viera da Silva; War, Senator Thomaz José Coelho de Almeida; Agriculture, Deputy Rodrigo Augusto da Silva. The Brazilian Minister at Washington is Dr. João Arthur de Louza Correia. The Consul-General of Brazil at New York is Dr. Salvador Mendonça. The American Minister at Rio de

Janeiro is Thomas J. Jarvis; the Consul-General, H. Clay Armstrong.

Finances.—The Sterling debt of Brazil amounted, on March 31, 1888, to £29,000,000, and the home debt to 487,806,700 milreis. The paper money in circulation on April 30, 1888, consisted of treasury notes to the amount of 188,861,263 milreis; notes of the Bank of Brazil, 15,276,850; notes of the Bank of Bahia, 975,550 milreis; notes of the Bank of Maranhão 166,700. The treasury notes form part of the home debt referred to. The budget for 1889 estimates the ordinary expenditure at 188,108,671 milreis; the outlay authorized for 1888 had been 141,280,103 milreis; the income in 1889 is estimated at 140,000,000 milreis, as compared with 188,895,000 authorized for 1888.

Brazilian finances have been gradually improving, as the diminished deficits of 1886 and 1887 show. During seven consecutive years the deficits, reduced to sterling money, have been: 1881, £1,294,000; 1882, £1,185,000; 1883, £2,784,000; 1884, £2,672,000; 1885, £3,947,000; 1886, £2,863,000; and 1887, £2,302,000. The deficits in 1886 and 1887 chiefly arose from railroads and other public works. The deficit for 1888, it is believed, will not exceed £1,300,000. The floating debt is \$4,656,000. The paying of wages to the freedmen will require an extensive circulation of additional silver coin to the amount of about \$7,000,000, for which the equivalent in treasury notes of 500 to 2,000 reis will be withdrawn. This amount of silver will have to be bought in the open market.

Army.—The actual strength of the Brazilian army is 1,520 officers and 18,528 men; in the event of war it may be raised to 30,000. There is also a gendarmerie in actual service of 6,847 men, 1,008 of whom are at Rio. After the new census shall have been taken, the National Guard, at present dissolved, will be reorganized. The Comblain carbine, now in use in the Brazilian army, will soon be replaced by another weapon, while the artillery is to receive Bange field-pieces.

Navy.—The naval forces of the empire were composed in 1888 of nine iron-clads, six cruisers, a mixed school corvette, a paddle-wheel steamer for artillery practice, four *patachos* or light school craft; five torpedo-boats of the first class; three third-class torpedo-boats; 15 gun-boats, 7 of which have paddle-wheels, 4 are wooden with screw, and 4 steel with screw; two steam-transports, and eleven steam-launches. The two new gun-boats have received their armament, and there were on the stocks, in a forward state of construction, two other gun-boats—all of them steel. The Brazilian fleet mounts 184 rifled Whitworth and Armstrong guns, 94 Nordenfeld *mitrailleuses*, 11 rapid-fire Nordenfeld guns, 4 Hotchkiss revolving guns, and 11 smooth-bore pieces. The collective horse-power is 19,329, and the tonnage, 40,252. It is manned by 4,272 sailors and officers.

Postal Service.—The report of the postmaster-general, dated Dec. 31, 1887, shows that there were then in operation 1,963 post-offices, of which 558 were in the province of Minas-Geraes, and 11 in that of Goyaz. The total receipts for the second half of 1886 and the whole of 1887, were 3,064,281 milreis, and the expenses 3,324,783, the deficit not exceeding 260,501, which is trifling considering the size of the country and the moderate rate of postage. Three provinces had a surplus. Money orders were paid to the amount of 1,712,204 milreis. The number of letters handled in the foreign mails was 4,012,879, distributed as follows: Portugal, 1,181,500; France, 678,452; England, 634,580; Germany, 554,320; Italy, 378,158; United States, 213,837; Rio de la Plata, 140,278; Spain, 97,117; Belgium, 44,628; other countries, 140,010. The number of foreign letters exceeded those of 1886 by 226,917. The home mails forwarded 12,042,998 letters and 27,271,189 newspapers.

Telegraphs.—In July, 1888, there were in operation 10,633 kilometres of Government telegraphs, with 18,408 kilometres of wire, connecting 170 offices. The service includes 48 kilometres of cable, the bulk of which is in the Bay of Rio.

Commerce.—The development in Brazil's foreign commerce during the quinquennial period 1882-'88 to 1886-'87 is shown in the ensuing tables, reduced to *contos*, or thousands of milreis:

YEARS.	Import.	Export.	Total trade.
1882-'88	190,364	197,088	387,297
1883-'84	194,432	216,014	410,446
1884-'85	178,481	226,270	404,701
1885-'86	197,502	194,962	392,464
1886-'87	209,407	228,520	477,927
Total	970,086	1,097,799	2,067,885

On examining the amounts exported of each of the nine principal products shipped, it will be found that for the last two fiscal years the figures were as follow: Coffee, 326,186 tons in 1885-'86, and 364,409 tons in 1886-'87; sugar, respectively, 112,399 and 226,010; cotton, 15,054 and 23,280; India-rubber, 8,150 and 14,083; tobacco, 25,904 and 22,938; hides, 16,768 and 12,975; cocoa, 4,188 and 8,566; Brazil-nuts, 5,564 and 5,692; and rum, 570,372 litres against 562,661. During the five years named, the export of diamonds reached altogether the value of 2,438,000 milreis, and that of gold bullion and dust 6,573,000 milreis. Coffee shipments from the ports of Rio de Janeiro and Santos were as follow, during the twelve months from July 1 to June 30:

DESTINATION.	1887-'88.	1886-'87.
	Bags.	Bags.
To Europe	1,812,784	8,110,472
To the United States	1,764,581	2,648,006
To other countries	117,778	135,229
Total	3,195,188	5,893,707

The sugar and cotton exportations from Pernambuco have been as follow:

YEARS.	Sugar.	Cotton.
	Tons.	Bales.
1886	106,797	125,244
1887	145,055	243,700
1888	177,818	269,396

The export of hides from Rio Grande do Sul in 1887 was 856,111, compared with 758,522 in 1886.

The American trade with Brazil exhibits these figures:

FISCAL YEAR.	From the United States to Brazil.	From Brazil to the United States.
1885	\$7,258,085	\$45,268,660
1886	6,480,738	41,907,533
1887	8,071,653	52,958,176
1888	7,068,592	52,710,224

The maritime movement at Rio in 1887 was as follows: Sea-going vessels entered, 1,102; sailed, 824; coastwise crafts entered, 1,203; sailed, 1,511. The nationality of vessels entered at Santos in 1887 was: Brazilian, 263; British, 129; German, 102; French, 58; other flags, 274; total, 826.

Railroads.—During the summer of 1888 the Minister of Public Works submitted his report to Parliament. The past thirty years have endowed the country with 8,402 kilometres of railway, the system being as follows: Government lines, 2,013 kilometres; lines on whose capital the Government has guaranteed interest, 2,585; provincial lines, 95; lines on which provinces have either guaranteed the interest or paid subsidies, 1,552; lines on which neither interest has been guaranteed nor subsidies granted, 2,157; total, 8,402. There will consequently be in operation in two years something like 13,000 kilometres of railway. The lines guaranteed by the state represent a capital of 143,322,128 milreis, or £16,125,852.

River Navigation.—Navigation on the central artery of communication, the São Francisco, is unencumbered for a distance of 1,500 kilometres, and, after the railways starting from Pernambuco and Bahia shall connect with it, the products of the interior of Minas-Geraes will have an outlet toward the sea. The rivers Tieté and Piracicaba in the province of São Paulo are already made navigable, completing communication in the eastern portion of the province, and soon the Mogiana Company will render navigable the rivers Mogy-Guaçu, Pardo, and Rio Grande, assisted by the Western Minas Railroad Company.

Harbor Improvements.—Notable progress has been made in improving the harbors of Maranhão and Ceará, and proposals have been made to the Government to put in better condition that of Pernambuco. A wharf of considerable length is to be built at Santos; the entry to the port of Rio Grande, continually obstructed by quicksands, is also to be deepened.

Austrian Steamer Lines.—The speculators for a rise in wheat at New York and Chicago ran up that cereal to such a point in 1888 and thereby enhanced the price of flour so much that Hungarian flour has sold more advantageously than ever at Rio, giving rise to regular steamship lines from Trieste and Fiume direct to Rio. The magnitude of this flour interest in Brazil will be best understood by referring to the amounts shipped thither from the United States in the past sixteen years, aggregating 9,462,648 barrels, there being a 21-per-cent. increase during the past eight years, as compared with the shipments of the preceding eight years.

Emancipation.—Prior to the resignation of the Cotegipe Cabinet, in March, abolitionists were still exposed to persecution at the hands of the men in power; but José de Patrocinio and Senators Joaquin Nabuco, Dantas, Prado, and João Alfredo have persevered undaunted in their endeavors to bring about the immediate abolition of slavery. The bill passed both houses on May 13, the recommendation of the new Cabinet and the law was signed the same day by the Princess-Regent, and promulgated. Full returns had at last been obtained of the slave registration of March 30, 1887. The total number was 723,419, of the declared value of 485,225,212 milreis. It was estimated, however, that emancipations and deaths had reduced this number to 600,000. The entire bill, as framed by Senator Prado, consisted of five brief articles, as follows: I. Declaring free, from date of the law, all slaves in the empire; II. Relieving from further service the free-born children of slave mothers; III. Localizing the new freedmen within their county for two years; IV. Empowering the Executive to issue the necessary regulations; V. Revoking all contrary provisions.

Judging from experience in other countries where slavery has been suddenly abolished, there was some apprehension that it would be difficult to secure the coffee-crop, then in its prime, and get it properly prepared for market. The freedmen have worked steadily, and there has been no disorder. The crop has come in a little more slowly, and is, perhaps, a little less carefully prepared. The planters have been sullen, but resigned. The rise in coffee in the past few years has benefited the planters. Sugar has also advanced considerably, and the central sugar-house system had prepared this branch of industry for the inevitable event for years past. The "Centro da Industria e do Commercio do Açúcar," an association of sugar-planters and exporters, is actively at work to introduce the diffusion process of extracting the sugar from the canes, instead of the almost antiquated centrifugal system, together with the latest and most approved American and European methods and machinery, and a more rational system of cane cultivation.

Immigration.—The number of immigrants

landed at Rio in 1887 was 31,310, 17,115 of them being Italians, 10,205 Portuguese, 717 Germans, and 274 Austrians. There also arrived at Rio 4,134 in transit for Santos and 405 for São Francisco, constituting a total of 35,849 immigrants as compared with 25,741 in 1886 and 30,135 in 1885. Adding to the landings at Rio the direct arrivals of immigrants at outports, 20,151, the aggregate gain of population in 1887 was 56,000. The Provincial Assembly of São Paulo has passed a law authorizing extension of aid to immigrants from abroad, to the number of 100,000 per annum, for five consecutive years, while the province of Minas-Geraes has contracted for 30,000, to be procured during a twelvemonth.

Industries.—Great enterprise and activity were displayed in many localities to foster and create a variety of industries. A firm in São Paulo has begun to turn out an article of wax matches, competing with the imported Swedish. Sulphuric acid is being manufactured from Sicilian brimstone, both in the province of São Paulo and at Rio. Rio and Porto Alegre have each a glass-factory, and at Rio Grande do Sul artificial guano is made. There is also a glue-factory. Tanneries are numerous, using the valuable domestic materials that abound. At Rio there are refineries of cotton-seed oil and castor-oil. The Government has three powder-mills, but gunpowder for hunting and mining is still imported. At Macacoe, near Rio, dynamite is manufactured. Soap of all grades is made at São Paulo, Porto Alegre, Pelotas, and Rio. Composition and stearine candles, vying with the best European and American makes, are turned out at Rio and Pelotas. Brazilian vegetable wax—*carnauba*—is used for a similar purpose, and seems to have a promising future.

Most of the cotton-weaving factories in Brazil do their own dyeing. At São Paulo calico-printing is carried on successfully. At Rio Grande do Sul there is a large woolen factory connected with a dyeing establishment. Steam sugar-refineries are in operation at Rio, Bahia, Taubaté, and Rio Grande do Sul. Several rectifying distilleries exist at Rio. Artificial wines, liquors, and cognacs, are chiefly made at Rio. There are many breweries, and some Brazilian beers have been awarded a premium in Europe, having stood the trip across the Atlantic admirably.

At Itá, in the province of São Paulo, a paper-mill is to be equipped and one at Maranhão. Creditable paper-hangings are printed at Rio on imported rolls.

There were in operation, on Jan. 1, 1888, 36 central sugar-houses, the Government guaranteeing the interest on 35 of them. Nearly all of the machinery was imported from France. Since Jan. 1, 1888, all machinery and tools intended to be used for manufacturing have been admitted duty free.

Viticulture.—In 1887 the province of São Paulo produced 5,000 hectolitres of wine, sell-

ing the red wines at 100 to 125 francs the hectolitre, and the white wines at 150 to 200. The Government has ordered for gratuitous distribution in Brazil 8,000 stalks of vines from France, and as many from Spain and Portugal, Madeira, and the Azores. The native vine, indigenous to the province of Matto-Grosso, *Vitis sycoides*, will also be widely distributed. At Pará a wine is made from fresh cocoa beans and pulp declared by travelers to be delicious and refreshing.

Exploring Expeditions.—The second Xingú expedition, under the command of Dr. von den Steinen, which in 1887 explored the interior of Matto-Grosso, returned to Cujaba early in 1888, the result being the discovery of a great Carib nation in the center of South America, the Bacairi and Nahugua, and the discovery of the Camayura and Anite tribes of Indians, who speak the ancient Tupi language, and whose weapons are slings. The tributary of the Xingú, the Oulnena, was thoroughly explored.

Toward the close of 1887, Col. Labre, after ascending the Madeira river as far as Bolivia, descended the Rio Madre de Dios at a point where it is joined by the Rio Aore or Aquiry, thus proving that communication between the Amazon and Bolivia is comparatively easy without undergoing all the trouble caused by the Beni rapids. This discovery seems to open up a great future for that region.

BRICKWORK. The construction of buildings in brick is a very ancient art. The fire-resisting qualities and remarkable durability of the material have contributed to make it the most popular of all building materials. In recent years there has been a rapid advance in the art of making bricks, which has, in a measure, revolutionized the construction of brick buildings. The shape was, until recently, to a great extent limited to the simple parallelopiped; but bricks are now produced in a great variety of forms and in different colors. Thus there are bricks formed so that when laid side by side they produce a continuous molding, either horizontally, as in the case of a string-course or plinth, or vertically, as in jambs of door and window openings. Bricks are also made in

MOLDED BRICK.

wedge-shapes for arches, and of other forms for the construction of pavements, curbs, sills, cornices, copings, etc. The form of brick in which the surface is ornamented is coming more into use every day, although this descrip-

tion of ornament is often made of terra cotta. The architect has thus at his command means of producing effects that were not previously within his reach. Although the architectural effect is satisfactory, the construction of brickwork,

MOLDED BRICK FOR DOOR-JAMB.

in regard to strength, is open to improvement. The common custom is to employ face-bricks of a superior quality to those on the interior of the wall, and this is an obstacle to good construction, as such bricks are almost invariably larger than the commoner varieties, and hence can not be properly bonded in or tied together. Even a graver error, which, in the United States, is almost universal, is that of using what is known as "running bond." Formerly the practice was to build brickwork in one of the systems known respectively as English and Flemish bond, and the ancient brick buildings in Europe are all of this construction. In recent years the running

MOLDED BRICK FOR PIERS.

bond has, in our country, almost entirely taken their place. In English bond, the bricks are laid with their long and short sides (technically termed stretchers and headers) parallel to the length of the wall in alternate courses, while in Flemish bond they are laid alternately headers and stretchers in each course. Both systems have the advantage of forming "bond," or, by the arrangement, lapping the bricks to produce a solid mass. The construction of running bond will depend upon whether the wall is exterior or interior. If the latter, the bricks will all be laid stretchers—that is, with the long side parallel to the side of the wall, except in every fifth or seventh course, when they will be laid headers. When the wall is exterior, all the bricks on the face are laid stretchers, bonding being obtained by laying the back bricks in every fifth or seventh course diagonally, and cutting off the corners of the face-bricks at these points, in order to permit their introduction. The objection to this form of construction is that, as headers are introduced

in only one course out of five, the remainder of the wall is unconnected, except by the mortar, and thus the principle upon which correct bonding is based, that no two mortar-joints should come under one another, is violated.

The strength of a wall depends, to a great extent, upon the quality of the mortar em-

The foundations of a building are obviously important. In localities where stone abounds, they are often constructed in what is known as rough or random rubble, which consists of rough pieces of stone laid, without dressing, in such a way as to produce the best bond possible under the circumstances. Examples

ORNAMENTAL BRICK.

EXTERIOR WALL IN RUNNING BOND.

ployed. To make good mortar, clean, sharp sand is required, and a lime having no inconsiderable hydraulic qualities. These are mixed in the proportion of about one of lime to four of sand, with no more water than is necessary to moisten the whole of the parts

ORNAMENTAL BRICK.

and allow of the mixture's being thoroughly worked. The custom in many parts of the country is very common of using lime that is but little better than pure chalk. Such lime is not at all suitable, and not a few of the building accidents that have occurred from weak

of this system of the construction of foundation are found in nearly all buildings of New York city, formed of the gneiss rock of which Manhattan Island is mainly composed. Brick is a good material for foundations, and, if it is well burned, the moisture has no effect upon it. Where brick is employed for foundations, it is usual to form footings. These consist of widely

INTERIOR WALL IN RUNNING BOND.

ORNAMENTAL BRICK.

spread courses, diminished by offsets equal to half the thickness of a brick till the width of the wall is reached. In good construction, every brick in the footings is laid a header where possible, while all stretchers necessitated by the width of the course are placed in the interior of the wall. The brick or stone footings may either be built upon the soil or

FOUNDATION OF HOLLOW WALL.

brickwork may be directly attributed to the bad quality of the mortar by reason of the employment of chalk lime.

upon a bed of concrete, depending upon the nature of the soil. Where hard rock or gravel is found on the site of a building, footings may

be laid directly upon it, but otherwise the use of concrete is advisable. Concrete for this purpose is composed of lime or cement mixed with sand and ballast. In heavy work, Portland or Rosendale cement is generally preferred.

Bricks being absorbent, the moisture from the ground will frequently rise by capillary attraction. To prevent this, damp courses are

Silverlock's bond the bricks are all laid on edge, stretcher and header alternately in each course, producing an appearance somewhat similar to that of Flemish bond in solid brickwork. Dearne's plan is to lay the bricks all headers and flat in one course, and all stretchers on edge in the other. The only advantage of hollow bond is the saving in material. Besides these bonds or systems of laying the bricks, there are others in common use. Diagonal bond is sometimes employed

SILVERLOCK'S HOLLOW BOND.

employed. These consist of a layer of some material impervious to moisture, which is laid immediately above the ground-line. Asphalt, sheet-lead, slate, and Portland cement are among the materials employed for the purpose. To prevent the penetration of water into the interior of a building, it is frequently advisable to construct an area-wall around the entire site, at a distance from the main walls of the building of about three inches. Such walls are built wholly below the ground, and are finished on top with a course of molded bricks. With the same object, the main walls of isolated buildings are sometimes constructed with a cavity in the interior, which not only effectually prevents the dampness from penetrating into the building, but also assists in rendering it warmer in winter and cooler in summer. Such walls, known by the general term of "hollow walls," are constructed of two casings about two inches apart, such casings being connected by the insertion of iron or brick ties every two or three feet. The ties are always formed in such a manner as to prevent the passing of moisture across them. At the bottom of the cavity in these walls is a gutter connected with the drain, and any water that finds its way through the outer casing is conducted away.

Hollow bond, as distinguished from hollow walls, is used in some parts of the country for the erection of small buildings, fence-walls, and in other positions where but little strength is required. There are two methods of constructing such walls, known respectively as Silverlock's and Dearne's, and both of these systems are limited in their application to walls of the thickness of a single brick. In

SEMICIRCULAR ROUGH ARCH.

in executing thick walls for heavy buildings. On the exterior it is similar to English bond; but on the interior the bricks are laid diagonally, with the object of obtaining a better bond. For the purpose of tying together the component parts of brick walls of all kinds, hoop-iron bond is sometimes employed. In England its use is common, but in the United States it is not employed to any great extent. The hoop-iron is laid in between the mortar-joints, in every fifth or seventh course, and is lapped at all corners and joints. To prevent oxidization the iron is often covered with

EQUILATERAL GAUGED ARCH.

tar, or is galvanized. Sometimes it has jagged edges to give it a better hold on the mortar.

The construction of arches in brick may be divided into two distinct classes: 1. Those known as gauged, in which each brick is cut or gauged to a wedge shape in order to produce a parallel mortar-joint, and in which the ends are curved to conform to the curve of the arch; 2. Those known as rough arches, in

which the bricks are laid without cutting. In the latter case, the difference in the lengths of the curves, that is, of the intrados and the extrados of the arch, is reached by the formation of wedge-shaped mortar-joints. Gauged arches are formed of specially made bricks, in which a proportion of sand has been used to render them friable, and the cutting is effected by means of a coarse-toothed saw, the exact shape being obtained by rubbing the sides on a stone, to the form of a template. This is

INVERTED ARCH.

often done by the bricklayer on the job, but more frequently in the brickmaker's yard, from detail drawings furnished him by the architect. The names by which arches are known, unlike most of the technicalities of the building-trade, are substantially identical throughout the country. They are taken in nearly every case from the curves to which they are formed. Thus we have semi or semicircular, segmental, elliptical, and cycloidal arches. Among pointed arches there is the equilateral, which comprises two arcs struck from the abutments. The inverted arch is always segmental, and is struck upside down, for the purpose of distributing the weight of the superincumbent building over the space intervening between two piers. Flat arches are useful over horizontal window and door heads, and are usually formed with the camber or curve on the intrados.

The manner in which the exterior joints of brickwork are finished varies considerably in different parts of the country and in different

FLAT ARCH.

kinds of work. In interior walls the joint is "struck," that is, finished by drawing the trowel along it to render it smooth. Where the same wall is plastered, the mortar is left rough so as to form a key for the plaster. In exterior walls the mortar-joints, as a rule, are finished level with the bricks, and the whole surface is painted with two or three coats of oil-paint. The mortar-joints are thus hidden. A small brush guided by a straight edge and dipped in white paint is used to paint in the mortar-joints at the proper distance apart.

BUDDHISM. An analysis of Southern Buddhism, which has been published by the Bishop of Colombo, embodies the results of twelve

years' observation of the system in Ceylon and first-hand studies of the sacred books. The author draws a general distinction between the traditional school of interpretation, as it is known to Singalese scholars, and that to which Europeans incline. "The Singalese tradition, if it differs, differs always in the direction of a meaning more puerile, more wooden, less Christian," although the higher meaning may in some cases be acknowledged by the Buddhist interpreter.

Numerical estimates of Buddhist adherents are of no value, because Buddhism, unlike other religions, does not claim exclusive possession of the ground. It is a parasitic religion, ready to thrive where it can, without displacing or excluding another with which it comes in contact. While a Christian or a Mohammedan or a Hindoo can be that only, a Buddhist can also be a Confucianist or a Taoist or both, and to a great extent a Hindoo or planet-worshiper. In Ceylon, the statues of Hindoo deities are found in the precincts of the Buddhist *viharas*; on the Buddhist festivals, Buddhists visit Hindoo and Buddhist temples alike; when Buddhists are sick the Hindoo or the devil-priest meets the Buddhist monk at the door without offense. "What is most practically the refuge of a Ceylon Buddhist is not anything truly Buddhistic, but the system of astrology, charm, devil-dancing, and other low superstitions." It is these, and not the doctrines of the Tripitaka or any rule of self-sacrifice, that the Buddhist has to abandon when he becomes a Christian.

Buddhism is a system of precepts or a method of escape from evil, which is discovered and lost again and again in successive ages. The precepts are held to be unchangeable, but become lost sight of till a new Buddha appears, who revives the knowledge of them for the benefit of his age. All the Buddhas of the successive ages—the term "ages" being taken in an infinite sense—"do and say exactly the same things; they are born in the same family, leave home at the same hour of the night, throw their bowls into the same stream, and so on." The Buddha of the present age is Gautama.

There is not the slightest hint that the truth came by revelation from any person superior to the Buddha, or that the Buddha is in any sense God. But, if it be asked whether Buddhists believe the Buddha to be a mere man, or to be the Supreme Being, the question can not be answered in one word. Buddhism does not possess the idea of distinct grades of being, permanently separated from one another. To Buddhism all life is one. He who was a god may now be a brute, and afterward may be a man. The difference is not one of indelible character, but of stage. But of all beings, a Buddha has reached the highest stage. He is, therefore, the supreme being, but the phrases in which this dogma is expressed do not imply anything like what we mean by God. The Buddha attained a position higher—not in dominion, but in enlightenment—than those of

the highest deities known to Buddhism, Indra and Maha Brahmá; in fact, he is represented as having passed through the stages of being both, on his way to his final birth, as a Buddha.

The sources of information respecting Gautama are, on the one hand, the Tripitaka, or threefold collection of sacred books, which form the canon of Southern Buddhism, and may be spoken of as the books of 250 B. C.; and, on the other hand, the biographies of Buddha, that of Asvaghosha, which is attributed to the first century, A. D., that which bears the name of Buddhaghosha, which may belong to the fifth century, A. D., and the *Lalit Vistára*, or "beautiful, detailed narrative," of uncertain date, but between the first and sixth centuries. The last works are the chief source of Arnold's "Light of Asia," while the books of 250 B. C. are the source of the lives given by Rhys Davids in the Hibbert Lectures, and Dr. Oldenberg in his "Buddha."

Evidence exists as to the prevalence as far back as about 250 B. C., of Buddha's teaching and of some of the sermons and traditions, carved on the rocks or on pillars, in different parts of India, in the form of edicts of Asoka under the name of Devánampiyó Piyadasi. Their date is established by the mention of contemporary Greek kings, and they are accredited in the Singalese chronicle, the *Maharanso*. In comparison with whatever historical matter is incorporated in the Tripitaka, the sources of information of the other class are untrustworthy. Whatever is included in them and not in the Tripitaka that must naturally have been inserted there if it had been believed, can be regarded as of later fabrication. Of this character are most of the points of the biographies that bear any reference to Christianity. Singalese chronicles go much further back than 250 B. C., and with the same circumstantiality. They give lists of kings who preceded Asoka, and lists of monks who were leaders of Buddhist congregations from Gautama's time till then. It would be unreasonable to refuse all credit to the earlier part of these chronicles. It is hardly possible to distrust them so far as to doubt that the sacred books, substantially as we have them, existed a hundred years earlier.

In the Pitaka substantial facts are chronicled correctly, but adorned, not overlaid, with fictitious and often absurd circumstances. The falsehood in the stories does not seriously interfere with the truth; it falls off directly the story is handled. The incredible elements of the Pitaka life of Gautama are mostly of this nature. They belong to what is little else than a conventional mode of narration; they are little more than the epithets that we used to select, without thought of truth or falsehood, from our *Gradus*, to adorn the plain substantives of our originals. The separation of the history from them requires no exercise of the critical faculty, and gives no room for arbitrary decisions.

The resultant biography of Gautama shows nothing supernatural and nothing that in those days was strange. Many high-born persons went through renunciations similar to his, and bore among their adherents the title of Buddhás. A like course was prescribed in the laws of Menu as a regular part of a Brahman's life. Gautama is not recorded as having performed any act of conspicuous or extraordinary goodness or self-sacrifice in his historical life; but he attributed to himself these and all sorts of noble actions in former births. Most probably his career was as nearly as possible that of an ordinary, devoted teacher, and he was distinguished, not by strange acts, but by a strange degree of sympathy, insight, and constructive ability.

The historical treatment of the life of Gautama shows nearly all the parts of his biography that are relied on as parallel to Christian history to belong to the unhistorical *Lalit Vistára* and the other later books. Whether these northern biographies borrowed from Christianity, is an interesting question that depends on the date of Asvaghosha—which some put as early as 70 B. C., some as late as 70 A. D.; on the veracity of the early Christian traditions as to the travels of the apostles; and on the degree of intercourse between Kaniska's Indian court and the western countries. But even were all admitted, the resemblances to Christianity are small and few. In the historical narration there are, to the author's view, only two points that bear resemblance to anything in the life of Christ. One is the visit of the old sage, who, after the birth of Gautama, predicted that he would be a Buddha, and rejoiced to have seen him; but this story is wanting in some of the important features of the similar incident in the life of Christ; and, moreover, it only corresponds with the common Indian custom of getting a sage to visit the infant and pronounce his horoscope. The other is the so-called temptation of Buddha by Mara; but in this case the attempt is very different from that which was made upon Christ by Satan, and is an inevitable incident of the story.

Other apparent instances are fictitious. By a multitude of little parodies, nearly all of them misleading, a total impression is conveyed which is very far removed from the truth. Likenesses to Christianity, and most touching ones, there are; but they are generally in the expression of man's weakness and need, not in the method of meeting it.

The Nirvána of the books and of present Ceylonese conviction is the state in which there is not left any capacity for re-birth. This state, which sees final death within reach, might be called the potentiality of final Nirvána; and it is inaccurately imagined to be happiness to have attained that potential stage, and to know that one has no more births before him. The attainment of Nirvána, thus inaccurately thought of, is possible in life; its final achievement, in the last death, is Paránirvána.

In practice, the Ceylon Buddhist among the masses is both better and worse than his creed. Better because, instead of a distant Nirvāna, or a series of births, he has before him the next birth only, which he thinks will be in heaven if he is good, in hell if he is bad; because he calls on God in times of distress, and has a sort of faith in the one creator, whom his priests would teach him to deny. Worse because his real refuge is neither Buddha nor his books, nor his order, but devils and devil-priests and charms and astrology and every form of groveling superstition.

BULGARIA, a principality in eastern Europe that was set apart from the Turkish Empire and given an independent government by the Treaty of Berlin, signed July 13, 1878. Eastern Roumelia was at the same time constituted an autonomous province of Turkey, remaining under the direct political and military authority of the Sultan. The governor-general was to be nominated for the term of five years by the Sultan, who must select a Christian, and submit his choice to the approval of all the treaty powers. The Sultan was given the right, which he has never exercised, to erect fortifications on the land and sea frontiers of Eastern Roumelia, and to maintain Ottoman troops there. The Roumelians were to preserve internal order by means of a gendarmerie, assisted by a local militia, but, in case of a disturbance of the peace within or without, the governor-general could call in Turkish troops. The treaty arrangements were overturned by a revolution that occurred on Sept. 17, 1885, when the governor-general was deposed, and the union of Eastern Roumelia with Bulgaria was proclaimed. Prince Alexander of Bulgaria assumed the administration of the province, and the Eastern Roumelians and Bulgarians joined in repelling the Servian invasion, for which the union of the two provinces gave occasion. The signatory powers held a conference in Constantinople, and as the result of their deliberations the Sultan issued a firman on April 6, 1886, in which he recognized the change in the *status quo* by confiding the government to Prince Alexander and by agreeing to a modification of the organic statute, at the same time reclaiming certain districts of Kirjali and twenty villages in Rhoupchous or the Rhodope, which are peopled almost entirely by Mussulmans. A commission was appointed to revise the organic statute in order to bring it into harmony with the changed conditions, chiefly by transferring the administration of the customs to the Bulgarian Government and amending the Turkish tribute. The proceedings of this Turco-Bulgarian commission were not completed, owing to the revolution of Aug. 20, 1886, which resulted in the abdication of Prince Alexander. The annual tribute to Turkey, which was fixed by the organic statute at 245,000 pounds Turkish, the Provincial Assembly arbitrarily reduced to 185,000 pounds, including

the customs equivalent, and after the revolution of September, 1885, no part of it was paid till 1888. Bulgaria has undertaken to pay the debt of Eastern Roumelia to the Porte, which at the beginning of 1880 amounted to 743,582 Turkish pounds, according to the modified estimate of the Provincial Assembly, and to 1,082,542 Turkish pounds, if the original sum is maintained.

The council of ministers was composed in 1888 as follows: Prime Minister and Minister of the Interior, Stambuloff; Minister of Foreign Affairs and of Public Worship, Dr. Stransky; Minister of Finance, Natchevich; Minister of War, Colonel Mutkuroff; Minister of Justice, Stoiloff; Minister of Public Instruction, Zivkoff. This ministry was constituted from elements of both the Liberal and Conservative parties on Aug. 31, 1887, after Prince Ferdinand's assumption of authority. It contained the three regents, Stambuloff, Mutkuroff, and Zivkoff, who had exercised the powers of government during the latter period of the interregnum, Zivkoff having succeeded Karaveloff after the latter's arrest for complicity in the military insurrection of February, 1887.

The present Prince of Bulgaria is Ferdinand, Duke of Saxe-Coburg, the youngest son of Augustus, the Duke of Saxe-Coburg, and the Princess Clementine, of Bourbon-Orleans, daughter of Louis Philippe, King of the French. Ferdinand, born Feb. 26, 1861, was elected prince by the unanimous vote of the National Assembly on July 7, 1887, in succession to Prince Alexander, who abdicated on Sept. 7, 1886. He assumed the government on Aug. 8, 1887. The treaty powers have not ratified his election, and none of them have yet formally recognized his government.

The National Assembly of Bulgaria under the Constitution of 1879 consists of a single chamber, the members of which are elected by universal suffrage, in the proportion of one to every ten thousand inhabitants, for three years. The prince may dissolve the Assembly, but must order new elections within four months.

Commerce.—The people of both provinces pursue agriculture almost exclusively, and grain is the chief product and article of export. Sheep are kept in large numbers, and there is a considerable household manufacture of woolen cloth and braid in Eastern Roumelia. There is an export trade in timber from the mountains. Wine and raki, tobacco, and silk cocoons are among the other products of this province. The imports of Bulgaria for 1884 were valued at 46,851,280 lei or francs, and the exports at 48,867,287 lei. In 1885 the trade of Eastern Roumelia is included from the 1st of November in the returns, which give the imports as 88,843,517 lei, and the exports as 42,017,984 lei. In 1886 the value of imports was 61,687,169 lei, and of exports 37,768,679 lei. The imports from Austria-Hungary were 16,481,598 lei in value; from

Great Britain, 15,829,805 lei; from Turkey, 12,899,346 lei. The exports to Turkey were valued at 16,958,508 lei; to France, 9,327,563 lei; to Great Britain, 4,585,685 lei. The share of Eastern Roumelia in the total imports was 15,860,000 lei, and in the exports 11,186,750 lei.

Finances.—The budget for 1887 makes the revenue 47,218,266 lei or francs, and the expenditure 47,374,414 lei. The estimates for 1888 fix the receipts at 53,708,046 lei, and the disbursements, at 69,047,770 lei. The chief branches of expenditure are: War, 23,223,340 lei; Interior, 7,518,694 lei; the debt, 6,373,438 lei; Finance Department, 5,763,112 lei; Public Works, 5,114,484 lei. In December, 1887, the Sobranje authorized a loan of 50,000,000 lei, of which 19,000,000 lei were to be applied to the construction of the Zaribrod-Sofia-Vakarel railroad, the same sum to the purchase of the Varna line, 2,000,000 lei to discharging the debts of Prince Alexander, and the remainder to army equipments. The Government was not successful in placing this loan. It undertook to pay 140,000 Turkish liras as the amount of the Eastern Roumelian tribute to the Porte, with 21,000 liras per annum on account of arrears, and in 1888 made the first payments. The quota of the Turkish debt to be borne by the principality of Bulgaria was left to be settled by agreement between the signatories of the Berlin Treaty, but the powers have not yet fixed any sum.

The Bulgarian Government in the latter part of 1887 reduced the tariff on goods coming from Turkey, and entered into an understanding with the Porte, which made a like concession. In 1888 the Turkish Government, in its desire to please Russia, adopted various harassing regulations, refusing to recognize Bulgarian postage-stamps or Bulgarian passports, and levying a duty of 8 per cent. on imports from Bulgaria. Bulgaria retaliated in May by placing the same duty on Turkish goods, until finally Turkey reduced its duty to 1 per cent. An order of the Bulgarian Government doubling the duty on Russian spirits in July provoked a remonstrance from the German consul at Sofia, who has charge of Russian interests until diplomatic intercourse with Russia shall be resumed.

The Army.—Universal obligatory military service has been adopted. The army consists of 12 regiments of infantry, 3 of cavalry, 3 of artillery, with 24 field-guns and 2 mountain-guns, and 7 companies of pioneers. The peace effective is 29,000 men, and the war strength 100,000 men. The South Bulgarian contingent in time of war is 26,000 men. The infantry, who are well drilled, are armed with Martini rifles. The Government, in 1888, purchased 15,000,000 cartridges in Belgium, prosecuted works of fortification at Varna, Bourgas, and other points, and prepared vigorously for war, which, Prince Ferdinand predicted in a speech that made a sensation throughout Europe in

the opening months of the year, was near at hand, and would find him ready to die for Bulgarian liberty.

Area and Population.—The area of the principality of Bulgaria is 24,360 square miles, and its population, according to a census that was taken in 1881, is 2,007,919, consisting of 1,027,808 males and 980,116 females. Eastern Roumelia or South Bulgaria, as it has been officially called by the Bulgarians since the union, has an area of 18,500 square miles, and contained on Jan. 13, 1885, when the last census was taken, 975,050 inhabitants. The Christian Bulgarians numbered 681,734; Turks and Moslem Bulgarians, 200,498; Greeks, 53,028; gypsies, 27,190; Jews, 6,982; Armenians, 1,865; foreigners, 3,733. The retrocession to Turkey of the canton of Kirjali, and of twenty Mussulman villages of the Rhodope in accordance with the Turco-Bulgarian arrangement of April 6, 1886, that was concluded on the recommendation of the Constantinople conference, reduced the Mussulman population by 40,000, and emigration has diminished further the number of Mohammedans. The capital of United Bulgaria is Sofia, Philippopolis, the former seat of the Eastern Roumelian Government having been reduced to a prefecture. Sofia has 20,501 inhabitants; Philippopolis, 33,442; Rustchuk, 26,168; Varna, 24,555; Shumla, 23,093.

The Diplomatic Situation.—In October, 1887, M. Nelidoff, the Russian ambassador at Constantinople, suggested to the Porte that the Sultan should order Prince Ferdinand to leave Bulgaria, and that Russian and Turkish commissioners should be sent to govern the principality for four months, choosing a new Cabinet, dissolving the Chamber, and ordering the election, at the end of three months, of a new assembly, to which should be submitted the choice of two candidates that Russia would nominate for prince. The incident of the forged documents supervened (see AUSTRIA-HUNGARY), and after the explanations between the Czar and Bismarck the German Government repeated its declarations regarding the illegality of Prince Ferdinand's position and its acquiescence in the restoration by peaceable and diplomatic means of Russia's influence in Bulgaria as it existed before the dismissal of the Russian Minister of War and the Russian officers of the Bulgarian army. Germany supported the Russian demand that the Sultan should declare Ferdinand a usurper, but Austria would not join in any declaration on the subject.

Revolutionary Raid at Bourgas.—Russian diplomatic activity was accompanied, as usual, by an attempt to incite insurrection in Bulgaria. Capt. Nabokoff, a Russian, who had been condemned to death for participation in the rebellion that had been effected at Bourgas in 1886 under cover of two Russian gunboats, but who had been set free on being claimed as a Russian subject, was the leader of the new attempt, and behind him was the chief of the

Bulgarian Russophiles, Zankoff, who was in exile at Constantinople, while his coadjutors were three cashiered officers of the Bulgarian army, and Andre Kappe, a Montenegrin. Money was supplied by the Slav committees in Moscow and Odessa. They recruited a band of over one hundred Montenegrin mercenaries, and chartered a Greek vessel at the Turkish port of Vasiliko to convey the party to Kustenje, pretending that they were emigrants. When near the village of Keupruli, on the Roumelian coast of the Black Sea, near Bourgas, they compelled the master of the vessel to set them on shore. They tried to incite the Roumeliotes to join them, but without success. The Prince of Montenegro had tardily telegraphed a warning of the plot to the Porte, yet the Bulgarian authorities received notice from Constantinople in time to intercept the revolutionists before they reached Bourgas. The Bulgarian troops nearly surrounded them, and killed eighteen, while many were taken prisoners, including Kappe, only about twenty making their escape into Turkish territory, where they were arrested by the Ottoman authorities. Capt. Nabokoff and Capt. Boyanoff, a notorious Bulgarian revolutionist, were among the slain. Among the documents captured were letters implicating Zankoff, Hitrovo, the Russian minister at Bucharest, the city attorney of Odessa, and a Montenegrin priest named Kapitchich, who had a hand in the abduction of Prince Alexander. Three other bands were organized in Montenegro for the descent on Bourgas, but the Turkish Government arrested some of the enrolled men, and prevented their embarking. A Russian war-vessel appeared off Bourgas at the moment when the attempt to surprise the place by night was to be made, and vanished after its failure. These events took place in the beginning of January.

Russian Proposals.—The Porte, which had recalled Riza Bey, its commissioner in Bulgaria, on the arrival of Prince Ferdinand, decided in January to send again a representative to Sofia, and appointed Kiazim Bey its commissioner. M. Nelidoff thereupon threatened to leave Constantinople, and the appointment was canceled. Under Russian pressure the Turkish authorities also released the Montenegrins who had taken part in the Bourgas affair. In February, Count Schouvaloff, the Russian ambassador at Berlin, explained the Russian position to the German Chancellor, and as a result of the *pourparlers*, a telegram was sent from the Russian Foreign Office, asking the powers to declare illegal the presence of Prince Ferdinand of Coburg in Bulgaria and at the head of the Bulgarian Government, and to communicate that declaration to Turkey, and request Turkey to notify it to the usurping prince. This was followed by a note explaining the consequences of such action, which would be that the Bulgarian ministry would drive Prince Ferdinand from Bulgaria, and convoke an

elective assembly under the supervision of the representatives of the powers; the assembly would send a deputation to the Ozar in acknowledgment of Russia's services in liberating Bulgaria; the Ozar, content with this act of satisfaction, would renounce the idea of having a civil or military representative in the future Government; and all the powers would accept any prince that the assembly would choose conformably to the stipulations of the Treaty of Berlin. Russia, after an interchange of views with all the cabinets, communicated the suggestion to the Porte, and was supported in identical notes by Germany and France, while England, Austria, and Italy sent separate communications of negative import. After receiving a second, more emphatic note from Russia, and one still more urgent from Germany, the Grand Vizier laid the matter before the council of ministers, and in pursuance of an *irade* sent a dispatch to M. Stambuloff on March 5, which ran as follows:

On the arrival of Prince Ferdinand of Coburg in Bulgaria, I declared to His Highness in a telegram of August 22, 1887, that as his election by the National Bulgarian Assembly had not received the assent of all the signatory powers of the Berlin Treaty, and as that election had not been sanctioned by the Sublime Porte, his presence in Bulgaria was contrary to the Berlin Treaty and was illegal.

To-day I have to declare to the Bulgarian Government that in the view of the Imperial Government his position remains the same—that is to say, the presence of Prince Ferdinand at the head of the principality is illegal and contrary to the Treaty of Berlin.

The effect of this declaration was to rouse into activity all the elements in Bulgaria that were hostile to Prince Ferdinand or to independence. Clement, Metropolitan of Tirnova, was dismissed for insulting the prince. Revolutionary bands made incursions from Macedonia and Serbia, but were promptly met by soldiery. Opposition journals called on Prince Ferdinand to resign, and anti-national cliques were busy in the army. Manifestations of a revolutionary spirit had been made easy by the action of Prince Ferdinand's Government in abolishing the press censorship before the close of 1887, and in restoring to their rank in the army many officers who had participated in the deposition of Prince Alexander and other Russian plots. Ferdinand, however, effectually counteracted these symptoms of restlessness by making a tour of the towns, in all of which he was received with demonstrations of loyalty that proved in the eyes of Europe the attachment of the mass of the Bulgarian people to their *de facto* prince as the embodiment of a stable government and of national independence.

Cabinet Crisis.—In the spring, Major Popoff, who had done more than any one else to defeat the Russian revolutionary conspiracy in the time of the regency, was arrested, with four other officers, on the charge of malversation of public money. A discrepancy of 7,000

france was discovered in the regimental accounts. For this his subordinates were chargeable, and no suspicion of dishonesty could rest on the patriotic soldier who had refused Gen. Kaulbars's offered bribe of 200,000 rubles to deliver Sofia over to the revolutionists in November, 1886. But he had offended Stambuloff, who was jealous of his influence with the prince, and therefore a court-martial cashiered him and condemned him to four years' imprisonment. Col. Nicolaieff, president of the court-martial, publicly declared that the trial was unfairly conducted, and on the strength of this opinion Natchevich and Stoiloff, the Conservative members of the Cabinet, urged the prince to quash the sentence or order a re-trial. Stambuloff threatened to resign if this advice were followed. On June 12, Stoiloff and Natchevich tendered their resignations. When apprised of their action, Stambuloff sent to the prince the resignations of himself and his Liberal colleagues. A compromise was effected, in accordance with which Prince Ferdinand, on June 28, remitted the penalty of imprisonment. The majority of the officers of the army were incensed at the result of the trial, and some of them entered into a plot to rescue him from prison, and seize Stambuloff and the other Liberal ministers. Five officers were arrested as ringleaders. Another dispute occurred between the Conservative members of the Cabinet and Stambuloff on account of attacks on the former in the Liberal press, and they again handed in their resignations, but the prince brought about an accommodation.

The Servian Frontier Rectification.—The dispute in regard to the possession of a tract of pasture lands in the Bregovo district, which was one of the causes of the Servo-Bulgarian war, was finally settled in July, 1888, in accordance with the agreement arrived at between the two governments, by a mixed commission sitting at Negotina. The difference between the two countries arose from the fact of the frontier line having become changed through the deviation from its former course of the Timok river. The question was settled by a mutual exchange of land. The Porte raised an objection to the direct negotiations with Servia in the first place, and now protested against the cession of Bulgarian territory without the previous consent of the suzerain power. This protest was simply intended as a formal assertion of reserved rights, and after explanations had been offered by the Bulgarian Government it was withdrawn. In September, when negotiations were opened for the conclusion of a commercial treaty between Bulgaria and Servia, Turkey put forth more emphatically a claim to participation in the treaty, requesting that the Servian Government should recognize the Turkish minister resident at Belgrade as the first Turco-Bulgarian plenipotentiary. But Servia consented to treat with Bulgaria alone.

The Eastern Railways.—From the time when rail connection between Europe and the Bosphorus was first contemplated, the project has passed through many vicissitudes. The statesmen who governed Turkey in the reigns of Abdul Medjid and Abdul Aziz planned a junction with the Austrian *réseau*, while Gen. Ignatieff, through palace influences and diplomatic chicanery, sought to shape a scheme to join the projected railways of European Turkey with those of Russia. For ten years or more the political troubles of the Porte prevented any step being taken. At length, in 1868, contracts were awarded to the Belgian Van der Elst, and when he failed, the Vienna banker Hirsch obtained a new concession, contracting to build a line from Constantinople to the Austrian frontier near Agram, with four branches running to the *Ægean* Sea from Adrianople, to Salonica from Pristina, to the Black Sea, and into Servia, the total net being 2,500 kilometres. On the security of a subvention of 14,000 francs per kilometre per annum for ninety-nine years, Hirsch obtained subscriptions for 1,980,000 bonds of 400 francs each, which were rendered attractive by the feature of lottery drawings. When the South Austrian Railroad Company declined to assume the contract for working the lines at a stipulated rental of 8,000 francs per kilometre per annum, Hirsch, with the aid of Parisian financiers, founded a French company for the purpose, called the *Société d'Exploitation des Chemins de Fer Orientaux*, which has since changed its domicile to Austria. Ignatieff, in 1872, after Mahmoud Pasha had become foreign minister, succeeded in having the whole plan changed. The Austrian and Servian junctions were abandoned, and the length of the line was reduced to 1,280 kilometres, running to Bellova, to connect with the Roumanian and Russian lines by means of the Varna-Rustchuk line. A part of the money that was subscribed for the abandoned portions was paid to Hirsch as compensation for the change of contract, none of it being returned to the bondholders. Austrian and English diplomacy was set in motion to induce the Porte to extend the Bellova line to Nish in order to join it with a projected line through Servia, and in 1875 Turkey and Austria entered into a mutual engagement to construct railroads to Nish on the one part, and to Belgrade on the other, before the end of 1879. Then came the bankruptcy of the Turkish treasury, the Servian war, the Bulgarian rebellion, and the Russo-Turkish War, all of which events had their origin in the conflict. The Treaty of Berlin settled the question in the Austrian sense, and restored the main features of the original Hirsch project. Servia and Bulgaria were bound to build the sections of the lines lying within their respective territories. Russian diplomacy endeavored still to defeat the arrangement by bringing pressure on Prince Alexander to grant a concession to Russian

contractors for a line from Sofia to Rustchuk, relying on Russian influence over the new principality to postpone indefinitely the construction of the line from Vakarel to Zaribrod enjoined by the Treaty of Berlin. The Bulgarian ministers steadfastly resisted the Russian demand, which was renewed and urged in many forms, and thus began the friction between Russia and Bulgaria. Russian influences at Sofia and Constantinople were strong enough, however, to delay the meeting of the *Conférence à Quatre*, which was announced for the early months of 1881, until 1883, and when the convention was finally drawn up the Bulgarian delegates were deterred from signing it until the Russian clique at Sofia concluded that further opposition was useless. Then a scheme to obtain the contract for Russian engineers was tried, but Karaveloff outwitted Kojander, the Russian diplomatic agent, and secured it for a Bulgarian syndicate. The coolness that arose on this account between the Russian representative and the Bulgarian Prime Minister, who was refused admittance to the Russian agency, excited the resentment of the latter, and brought him into the condition of mind to prepare the revolution in Eastern Roumelia in the following year, which led to the complete estrangement of Russia.

By the convention concluded at the *Conférence à Quatre*, in 1883, Austria, Bulgaria, Servia, and Turkey agreed among themselves to build railroads connecting the European system with Constantinople and Salonica. The two lines were to be completed and opened for traffic in the summer of 1886. Austria built the section from Budapesth to Belgrade and opened it in September, 1884. Servia plunged into debt in order to fulfill her part promptly, and had the roads running southward to the Turkish frontier and eastward to the Bulgarian frontier ready for operation before Bulgaria and Turkey had fairly begun their continuations. Bulgaria was the slowest in performing her part of the engagement, and aroused the anger of the Servians, who were the readier on this account to begin the campaign against Bulgaria that placed it out of her power to complete her section of the Constantinople line within the time set. Turkey was not much behind Bulgaria in finishing the junction lines. The Salonica railroad was joined to the Servian branch from Belgrade in 1887, yet could not be opened under the provision of the convention before the route to Constantinople. It was, however, officially opened on May 18. The passage from Vienna to Salonica takes thirty-five hours.

The Bulgarian section has been built with domestic capital and native labor at the low cost, for a mountain railroad, of 200,000 francs per mile. The total cost, amounting to 17,000,000 francs, inclusive of rolling-stock, has been defrayed from the ordinary revenues of the principality. 3,500,000 francs being still due to the contractors. The length is 114 kilometres, or

72 miles. The road was ready to go into operation in July. From Vakarel to Bellova the line had already been built by the *Société des Raccordements*, and was the property of the Porte, subject to a mortgage to the construction company. By the terms of the original contract the Porte was under obligations to give the working of both the Macedonian line and the Bulgarian junction road to the *Société d'Exploitation des Chemins de Fer Orientaux*, but it had long before quarreled with Baron Hirsch, and would have no further dealings with his company. It offered the contract for the Bellova road to the *Société*, which, possessing no rolling-stock, sublet it to the contractor working the Servian railroads. The Bulgarian Government applied for permission to operate the junction line, and received no reply, as Russian influences were predominant in Constantinople. The Turkish Government also refused to conclude a postal convention in regard to Eastern Roumelian letters until Bulgaria threatened to use the Austrian post-office in Constantinople, and on July 12 the Turkish authorities consented to accept them when bearing Bulgarian stamps.

The Bulgarian railroad was opened with festivities on the 12th of August, and the first through train that passed over the international route entered Constantinople on the morning of the 14th. The trip from Vienna to Constantinople takes less than forty-eight hours. The Bulgarian line had been open for internal traffic from July 5.

Brigandage.—The Bulgarian Government had a serious grievance against the Turkish authorities in the fact of their supineness in regard to the operations of Macedonian brigands who made incursions into Bulgaria from the Balkan mountains, and when safe on Turkish soil again made no pretense of concealing themselves or their business, but openly established their arsenals in the villages. On July 8, a band of fifty brigands from the Rhodope descended on Bellova, and carried off two railroad officials, Austrian citizens named Ländler and Binderby. They gave notice that their prisoners would be released on the payment of a ransom of 8,800 Turkish pounds into the hands of a Greek named Illiopoulos, the consular agent of his Government at Tatar-Bazardjik. The diplomatic agents of England, Austria, Italy, Servia, and Roumania demanded of Stambuloff that he should take steps to secure the release of the captives, which he finally accomplished at the end of five weeks by the payment of the stipulated ransom. Other acts of brigandage led to fresh representations. Sometimes the robbers assumed the character of partisans of Russia, whose object was to drive Prince Ferdinand from the throne. Their bands were composed of Macedonians, Montenegrins, and Bulgarian refugees. Their chief lurking-place was in the Rhodope mountains. The Bulgarian Government redoubled its efforts to repress the evil, and through its remonstrances obtained the co-

operation of the Ottoman authorities. The district around Sofia was infested with robbers, and was scourged with gendarmes, who captured some. A band was surrounded by troops near the Macedonian frontier, and fourteen were captured and straightway hanged.

Seizure of the Bellova Railroad.—On July 15 the Bulgarian Government, alleging the necessity to guard the line in consequence of the attack of brigands on the station at Bellova, took possession of the Bellova-Vakarel Railroad. The *concessionnaires* of the Porte had already been refused permission to operate the line, on the ground that a Bulgarian law forbade a foreign company from working a line over Bulgarian territory without special permission, which the Government could not see its way to accord. The Porte appealed to the organic statutes of Eastern Roumelia, but the Bulgarian Government refused to recognize this as being longer in force after the Tophané convention and the retrocession of the Rhodope villages. Finally, in order to clear away the complications arising from illegalities on its own side, the Porte decided to turn over the administration of both the Bulgarian junction and the Vranja-Uskub line to Baron Hirsch. The Sofia Government still insisted on a preferential right to work the Eastern Roumelian section in connection with the rest of the Bulgarian line, to the advantage of both the international and the local service, and offered to assume all responsibilities for the operation, the interest on the bonds, and the purchase of the road. A truce was agreed to, whereby the Oriental Railway Company assumed the administration of the Constantinople line, and provisionally of the Bulgarian junction line. When Baron Hirsch's company attempted to take over also the Vranja-Uskub line difficulties were invented, and the Franco-Servian company was left in possession. The Bulgarian Government arranged through an English syndicate to purchase the Varna-Rustchuk Railroad, with the proceeds of an issue of bonds, the total sum amounting to nearly 47,000,000 francs. The road, which continues temporarily its mail and through passenger service, was transferred to the Government administration on August 26. A new line, 200 kilometres long, passing through Rasgrad and Tirnova, and joining the southern railway, is determined upon.

BURIAL, LAW OF. The due protection of the dead engaged the earnest attention of the great law-givers of the polished nations of antiquity. The laws of the Greeks carefully guarded the private rights of individuals in their places of interment, and a similar spirit shows forth in the clear intelligence and high refinement of Roman jurisprudence. Upon the common law of England (from which the large body of American jurisprudence is deduced) the Roman civilization, laws, usages, arts, and manners must have left a deep impression, have become intermixed and incorporated with Saxon laws and usages, and constituted the body of the

ancient common law. For about four hundred years England, under the name of Britain, formed a part of the Roman Empire; and there is no reason to believe that, when the Roman domination came to an end, the Romanized Britons abandoned with political allegiance the civilization and jurisprudence they had so long enjoyed; still less that they would seek or desire in any way to withdraw from the sepulchres and graves of their dead the protection that those laws had so fully afforded. On the contrary, it is distinctly shown by Scandinavian historians that the partially civilized Saxons had been specially taught to reverence their places of burial. Nor do we find in the history of the occasional inroads of the Danes any evidence that these invaders obliterated in the slightest degree the reverential usages in the matter of the dead coming down from the Romans or from Odin. The early laws of that rude people, carefully collected in the twelfth century by the learned antiquarian, Saxo Grammaticus, speak with abhorrence of those who insult the ashes of the dead, not only denouncing death upon the "*alieni corruptor cineris*," but condemning the body of the offender to lie forever unburied and unhonored. The law of the Franks (near neighbors of the Saxons) not only banished from society him who dug up a dead body for plunder, but prohibited any one from relieving his wants until the relatives of the deceased consented to his readmission to society, thus distinctly recognizing the peculiar and personal interest of the relatives in the remains. Nor was the right to protect the dead abrogated by the Norman Conquest. It is true that the swarm of Roman Catholic ecclesiastics that poured into England with the Conqueror exerted themselves actively and indefatigably to monopolize for the Church the temporal authority over the bodies of the dead, and finally succeeded in ingrafting upon English common law that curious and subtle distinction which still exists in Great Britain and her colonies, viz., that the heir can invoke the civil courts to protect (or give compensation for an injury to) the monument, coffin, or grave-clothes of his ancestor, while the ecclesiastical authorities alone have the right of property in the remains and the disposal of the body of the dead person. This distinction has never been fully recognized by common law in the United States; and because the American and English cases differ on this point, it is necessary that the student of the law of burial should acquaint himself with the history of burial law as above briefly recounted. When the United States adopted the English common law as the law of the land, they eliminated from it the ecclesiastical element, and thus the right to protect the bodies of the dead reverted to those who had previously possessed it. But to this day the taint of ecclesiastical interference in civil affairs is observed in some States. Thus, it has been held that neither the heir nor the executor nor

administrator could maintain an action at common law for the personal mutilation of a corpse placed upon a railroad track and run over by a train, whether such mutilation was accidental or intentional; but in nearly every State the common law has been abrogated or supplemented by statutes, making it both a civil and criminal offense to mutilate the body or disturb the dust of a dead person. It is worthy of remark that, while the law has in many instances recognized the right of individuals, by will or by contract during life, to dispose of their bodies after death, it has never yet recognized any right of the heir or the executor to dispose of the cadaver for any purpose except that of burial—for example, neither the heir nor the executor has the right to sell the dead body to a medical college for dissection.

The duty of burial lies primarily upon the executor or administrator, but the rule involves only so much of the idea of property in the remains as is necessary to enable him to do his duty; and, when the burial is over, the right of the executor ceases, except in case of an improper interference with the cadaver, the grave, the coffin, or the grave-clothes. In the absence of any testamentary provision, the husband has the right to designate the place of burial of his deceased wife; but, after the body has been once buried, any further disposition of the remains belongs to the next of kin. A similar right to control the burial-place of a deceased husband rests with the wife; and it has even been held that a widow who had ordered the funeral of her husband was liable for the cost thereof, although she was an infant at the time, the expense being deemed necessary. Either wife or husband can be compelled to perform the duty of burial or adopt the alternative of renouncing the right; but the method and place of burial are

in their discretion if they choose, subject only to such considerations of public policy as would prevent indecency, impropriety, or danger to the living. The children of a deceased person possess, next in order, according to the priority of their ages, the right to bury their parent, together with the additional right to remove or protect the remains. If there be no children, then the next of kin possess the right; but, if the next of kin be of an equal degree of relationship to the deceased, but divided in opinion, the courts may determine, by evidence of the wishes and mode of life of the deceased, the method and proper place of burial. In case the deceased dies away from home and friends, the stranger in whose house the body is may cause it to be buried, and pay the expense out of the effects of the deceased, or have a primary claim upon the decedent's estate. And, in case the relatives are unable or unwilling to bury the dead body, the public authorities must perform the interment.

As has been previously mentioned, there is no property in a corpse; it can not be retained by creditors, nor attached for non-payment of debts; it is not an export nor an import, and can not be taxed as such. Yet the common law is not without remedies to protect graves. A suit for trespass can be maintained by the owner of the land or person having charge or custody of it against any person disturbing a grave; the party who has caused the burial, or the next of kin, can bring an action for any injury done to the monument, the coffin, or the grave-clothes, and equity may be invoked to protect a grave from desecration. But, while these are the common-law remedies, the statutes of nearly all the States of the Union have created additional protections and remedies, making the disturbance of the dead a criminal offense, and severely punishing the desecration of graves.

C

CALIFORNIA. State Government.—The following were the State officers at the beginning of the year: Governor, R. W. Waterman, Republican, elected Lieutenant-Governor, but acting as Governor since the death of Governor Bartlett in 1887; Secretary of State, W. C. Hendricks, Democrat; Treasurer, Adam Herold, Democrat; Comptroller, J. P. Dunn, Democrat; Attorney-General, G. A. Johnson Democrat; Surveyor-General, Theodore Reichert, Republican; Superintendent of Public Instruction, Ira G. Hoitt, Republican; State Engineer, William H. Hall, Democrat; Railroad Commissioners, A. Abbott, P. J. White, J. W. Rea; Chief-Justice of the Supreme Court, Niles Searls; Associate Justices, E. W. McKinstry, J. D. Thornton, J. R. Sharpstein, Jackson Temple, T. B. McFarland, A. Van R. Patterson.

Valuations.—For 1887 the total assumed valuation of the State was \$908,119,480, and for 1888, before revision by the State Board of Equalization, \$1,083,338,328, an increase in one year of \$175,218,848. Fresno County leads with an increase of \$21,649,564, followed by San Francisco with \$20,974,905; San Diego, \$19,127,914; Santa Clara, \$15,428,412; Los Angeles, \$12,678,218; and Tulare, \$9,360,958. The total valuation of San Francisco County is \$272,711,006.

Decisions.—On April 30 the Supreme Court of the United States rendered a final decision adverse to the State in the celebrated tax suits brought to recover State and county taxes assessed upon the principal railroads within its jurisdiction. The defenses set up by the defendant companies were, first, alleged discrimi-

nation against the companies contrary to the fourteenth amendment of the Constitution in disallowing a deduction for mortgages, which is allowed to all other citizens; second, that the assessors included property which, by the State Constitution, the State Board of Equalization had no right to assess, but which was assessable and actually assessed by county boards; third, that assessments in some of the cases included franchises granted to the company by Congress, such as that of constructing railroads in the United States' Territories as well as in the State. The Circuit Court found these defenses to be true in points of fact, and the Supreme Court without expressing any opinion on the first ground of defense, based on the fourteenth amendment, sustains the other grounds and affirms the judgments of the Circuit Court. The decision conforms to the former decision of the Court made two years ago, in reference to similar taxes on some of the same roads, the only new point being the illegality of taxing franchises granted to the company by Congress. The judgments of the Circuit Court in all cases are affirmed.

This decision covers suits brought by the State against the Central Pacific Railroad Company, Southern Pacific Railroad Company, Northern Railway Company, and California Pacific Railroad Company.

On May 31, in the case of the Turlock Irrigation Company *vs.* Williams, the State Supreme Court rendered a decision of great importance, upholding the constitutionality of the Wright irrigation law passed by the last Legislature. Extensive irrigation has been hitherto impossible in the State by reason of the decision of the same court, that riparian owners had a right to the natural and undiminished flow of the stream as against all other persons. As any act of the Legislature giving to other individuals or private corporations rights in the stream would be unconstitutional, the Wright law created public irrigation districts, provided for their organization, and then declared that the use of water required by such districts for irrigation, together with rights of way and other property necessary for them *should be a public use*, and that private rights and property should be condemned and taken for such use. The court decided that such districts were in effect public corporations, and their right to take or condemn private property was constitutional. The court says:

The districts, when organized as provided in the act under discussion, have all the elements of corporations formed to accomplish a public use and purpose, according to the rules of law laid down in *Hagar vs. Supervisors of Yolo County*. Such a general scheme, by which immigration may be stimulated, the taxable property increased, the relative burdens of taxation upon the whole people decreased, and the comfort and advantage of many thriving communities subserved, would seem to redound to the common advantage of all the people of the State to a greater or less extent. It is true that incidentally private persons and private property may be benefited, but the main plan of the Legislature, viz., the general wel-

fare of the whole people, inseparably bound up with the interests of those living in sections which are dry and unproductive without irrigation, is plain to be seen pervading the whole of the act in question. If the use for which property is taken be to satisfy a great public want or public exigency, it is a *public use* within the meaning of the Constitution, and the State is not limited to any given mode of applying that property to satisfy the want or meet the exigency.

Another decision of this year declares the act of 1880, providing for the protection of lands from overflow, to be unconstitutional in that it permits the levy of assessments upon land-owners without giving them notice or allowing them a hearing thereon, providing also for a summary mode of collection without a suit at which the tax-payer could be heard.

Industrial.—The total wheat product of the State for 1887 is estimated at 874,000 tons of 2,000 pounds each, distributed among the counties as follows:

COUNTIES.	Tons.	COUNTIES.	Tons.
Alameda	25,000	San Luis Obispo ..	40,000
Butte	70,000	Santa Barbara	20,000
Colusa	30,000	Santa Clara	10,000
Contra Costa	30,000	Santa Cruz	10,000
Fresno	50,000	Shasta	5,000
Kern	30,000	Siskiyou	5,000
Lake	4,000	Solano	30,000
Los Angeles	30,000	Sonoma	15,000
Mendocino	5,000	Stanislaus	50,000
Merced	50,000	Sutter	50,000
Monterey	30,000	Tehama	40,000
Napa	5,000	Tulare	50,000
Placer	15,000	Ventura	10,000
Sacramento	20,000	Yolo	50,000
San Bernardino	5,000	Yuba	15,000
San Diego	15,000		
San Joaquin	60,000	Total	874,000

While the eastern and northern counties of the Sacramento valley show an increased yield over 1886, there is a decrease in the San Joaquin and Santa Clara valleys and in the southern counties. The total product is nearly 200,000 tons less than in 1886.

The production of wool for 1887 is placed at 31,564,231 pounds or about 7,000,000 pounds less than in the previous year. Revised estimates give as the production for 1884, 37,415,330 pounds; for 1885, 36,561,390 pounds, and for 1886, 38,500,160 pounds.

The raisin industry is in a flourishing condition, the product for 1887 being 800,000 boxes or 1,600,000 pounds, an increase of nearly 100,000 boxes in one year. Nearly one half of this total comes from Fresno County, which a few years ago was considered a barren plain, but which has proved to be admirably adapted to this industry.

Other dried fruits were produced in the State as follow:

Pounds.		Pounds.	
Prunes	1,625,000	Figs, sun-dried	90,000
Apples, sun-dried ..	750,000	Apples, evaporated ..	550,000
Peaches, sun-dried ..	1,750,000	Apricots, evapo- rated	2,900,000
Plums, sun-dried ..	450,000	Apricots, bleach'd ..	
Pears, sun-dried ..	40,000	Peaches, evaporat- ed, peeled	500,000
Grapes, sun-dried ..	600,000	Peaches, evaporat- ed, unpeeled	750,000
Apricots, sun-dried ..	200,000		
Nectarines, sun- dried	100,000		

There were also produced 1,090,000 pounds of honey extracted, 250,000 pounds of honey in the comb, and 25,000 pounds of beeswax.

There was an estimated yield of 1,500,000 pounds of walnuts, 500,000 pounds of almonds, and 250,000 pounds of peanuts.

The vintage of 1887 yielded 13,900,000 gallons distributed among the counties as follows: Napa, 2,700,000; Sonoma, 1,500,000; Santa Clara and Santa Cruz, 2,220,000; Alameda and Colusa, 1,000,000; Fresno, 2,000,000; Los Angeles and south, 2,000,000; Sacramento and north, 1,000,000; other counties, 1,500,000.

The total acreage of vines in the State is estimated at 150,000 acres, of which about 100,000 acres are in bearing.

Chinese Immigration.—The number of Chinese arriving and departing through the port of San Francisco during the period from 1852 to Nov. 17, 1880, the date at which the restriction act went into effect, was 253,085 and 123,061 respectively.

From Nov. 17, 1880, to Aug. 5, 1882:	
Arrivals	45,665
Departures	13,414
From Aug. 5, 1882, to Dec. 31, 1885:	
Arrivals	18,703
Departures	40,321
For the year ending Dec. 31, 1886:	
Arrivals	6,714
Departures	12,267
For the year ending Dec. 31, 1887:	
Arrivals	11,572
Departures	9,919

The collector of the port says: "Our Chinese population, notwithstanding the statistics indicate an excess of departures over arrivals since Aug. 5, 1882, in fact shows no diminution, being recruited through the underground viaducts, across the borders from British Columbia and Mexico."

Political.—The only State officer to be regularly elected this year was a Chief-Justice of the Supreme Court. The Prohibitionists nominated their candidate, Robert Thompson, on April 4, at a convention which also chose delegates to the National Prohibition Convention. The Democrats on May 17 nominated Niles Searls, also at a convention for selecting delegates to the National Convention and presidential electors. The Democratic platform adopted at this time indorses the administration of President Cleveland, favors tariff reform, free coinage of gold and silver, the election of United States Senators by a direct vote of the people, and the establishment of a system of postal telegraphy by the Government. The following portion relates to State issues:

Resolved, That we favor the enacting of such measures as shall place our various industries on an equality before the law in the use and distribution of the waters of the streams of this State for irrigation, mining, milling, and other beneficial purposes.

We commend the action of our Democratic State officials in pressing the California tax cases toward ultimate decisions, and hope this most important issue will not be permitted to rest without final adjudication upon its merits. We once more condemn the acts of those corporations which have persistently refused to pay their lawful portion of the public revenue. This failure to respond to a just demand has seriously contracted the public-school fund, and must render our educational system less effective, until collection is enforced, or the honest tax-payer is compelled to contrib-

ute beyond his proportionate share. The Republican party, ever sincere in its professions, has finally disavowed all intention to resist the demands of its corporate masters. It refuses to stigmatize their encroachments or to question their misconduct, but, on the contrary, as the action of its late State Convention demonstrates, yields ready compliance to their dictation. While fully appreciating the benefits of organized capital, we declare that the protection of those privileges which our Constitution declares are the common heritage, is paramount to the increase of individual wealth.

Resolved, We believe that the public should be protected from the great non-tax-paying trusts and corporations which now challenge the authority of the Government. The Democratic party was founded to maintain the interests and liberties of the people. It alone is competent to resist those encroachments which imperil the safety of the State. The Republican party, while professing to be the friend of labor, has demonstrated by its uniform action that its tendencies are toward the creation of monopolies and trusts, through whose instrumentality alone it hopes to perpetuate its existence. The Democratic party emanated from the people. Its aim has always been to care for the weak and to be just to the strong. While it is ever ready to promote industries and to stimulate enterprise, it never will permit wealth to shirk its rightful obligations or to impose upon poverty the expenses of a Government formed for the benefit of all.

No nomination was made by the Republicans at their State Convention in May, which was merely preliminary to the National Convention, but a second convention was held in August for that purpose and for the purpose of nominating presidential electors. Before this date the resignation of Judge McKinstry created a second vacancy on the Supreme Bench to be filled by popular election. The convention nominated W. H. Beatty, formerly Chief-Justice of the Supreme Court of Oregon, to be Chief-Justice and S. D. Works to succeed Judge McKinstry. The following platform, prepared by an indorsement of the work of the National Convention, was adopted:

Resolved, That we declare that the welfare of California demands, and the dignity of labor and the interests of capital require, the maintenance by the National Government of the American system of a tariff for protection, under this policy which has been constantly supported by the Republican party since its foundation. . . . We arraign the Democratic party of California for supporting the national Democratic party, which stands upon a platform that declares for British free trade as promulgated by the Mills Bill, and view with alarm this assault upon our American labor. We insist that the success of this British policy would destroy the growing industries of our commonwealth, especially the grape, raisin, nut, wool, lumber, borax, lead, quicksilver, sugar, beet, and cereal industries; also our manufacturing interests, and would reduce the wages of our workmen to starvation point; and we further believe that the legitimate efforts of organized labor to protect itself against cheap and contract labor, is a direct step toward the perpetuation of the American protective tariff system sustained by the Republican party; also, that proper apprenticeship laws should be adopted.

Resolved, We pledge to the American people, and especially the people of California, that our candidates for Congress, if elected, will sustain the protective policy of the Republican party, and will oppose the British and Solid South policy of the Democratic party; that our American industries shall be protected for the benefit of the American people, and that American labor shall be fostered and protected against the competition of foreign labor; we denounce as un-

American and contrary to the best interests of the Republican party the cheap-labor policy of the Democratic Solid South of to-day, as we did the slave-labor policy of the Democratic Solid South of 1861; and we declare that the one was, and the other if permitted to continue will be, destructive to the best interests of the laboring-classes of this republic.

Resolved, That the purity of the ballot is the pillar of the State, and the denial of a free ballot to the humblest American citizen, whatever his color or race, imperils the liberties of the people; we therefore denounce as dangerous to our country the Democratic policy of the Solid South in depriving the colored people living there of their right to vote. A government based upon frauds committed against the elective franchise can not long survive.

Resolved, That a financial policy whereby both gold and silver shall form the basis of circulation, whether the money used by the people be coin or in certificates redeemable in coin, or both, as convenience may require, is imperatively demanded.

Resolved, That we commend our Representatives in Congress for their efforts in behalf of restrictive Chinese legislation, thus redeeming the pledges of the party made for them, and renew our determination to make such restriction effective, and in every way to prevent the competition of Chinese with American labor. We thank the Republican National Convention for its emphatic declaration on the subject, and we have implicit faith that the Republican party of the nation will protect us in all our industries against the Chinese.

On August 10 the State committee of the American party adopted the Republican ticket as their own. On the following day the Democratic State committee added the name of Jeremiah F. Sullivan to their ticket as the successor of Judge McKinstry. Some doubt was felt in the early stages of the campaign as to the ability of the Republicans to carry the State on account of the failure of the National Convention to nominate James G. Blaine, the choice of Californian Republicans for President, and the hostile record of Harrison, the nominee, toward Chinese exclusion. These factors did not, however, prove influential with the voters, and at the November election the Republicans obtained a strong plurality on both the State and National ticket, electing a Congressional delegation of the same complexion as in the preceding Congress. The official vote for President will be found in the article entitled "United States."

San Francisco.—During 1887 the bank exchanges for the city reached the amount of \$828,427,816.35, an increase of \$186,206,425.14, or 22 per cent. This shows San Francisco to be the sixth city of the Union in the volume of banking business. In round numbers the exports amounted to \$33,000,000, against \$35,000,000 for 1886, showing an apparent decrease of about \$2,000,000.

The imports for the year reached \$41,780,943, against \$36,048,621 for 1886, showing an increase of \$5,732,322. The customs receipts were \$6,742,078.41, against \$5,855,619.93 for 1886, an increase of \$886,458.48. Despite the fact that two transcontinental railway lines have been completed to the Pacific Ocean on the north and one on the south, San Francisco remains the great port of entry for teas and silks.

CAMPS FOR BOYS. Summer camps of a social, or at least of a non-military character, have long been a distinctive feature of American rural life. They are a natural outgrowth of the Methodist camp-meeting, which, in its turn, was but an organized development of a life common to all the pioneer settlers of the continent. The idea has developed in many different directions. In the older States, the canvas tents of the early camp-meeting have been superseded by permanent structures, as at Cottage City, Mass., and Ocean Grove, N. J. The educational purpose in connection with such gatherings found its first successful realization at Ohantauqua, and there are now several similar organizations in various parts of the country. Among the most commendable of these annual encampments are those intended for the benefit of boys, and incidentally for the convenience and necessities of their parents and guardians. Such camps are of comparatively recent origin, the oldest of which an authentic account is at hand having been opened for its first season in 1885. But long before this, encampments formed a more or less regular feature of the summer term in many schools, that at West Point, established as a regular part of the course in 1816, being, no doubt, the first of its kind in the country. It is certain that as early as 1860 Mr. Gunn, principal of the famous "Gunnery," as his school was called, in Litchfield, Conn., used to take his pupils into camp among the beautiful Berkshire hills, and about twenty-five years ago William T. Adams ("Oliver Optic"), in a story for boys, entitled "In School and Out," introduced an episode of camp-life. Mr. Adams informs us that the whole passage is imaginary, and that he had never heard of such an enterprise on the part of any school.

The instances cited differ from modern camps for boys in that they are either undertaken for recreation alone or form a part of the regular curriculum. The modern camp, on the contrary, is an independent affair, existing for its own purposes and having a definite object in view, namely, the care and government, with or without instruction, of a number of boys. With a great many parents and guardians the long summer vacation presents numerous perplexing questions, and in many cases it is difficult to provide adequate amusement and recreation coupled with reasonable supervision and restraint. The summer camp is designed to meet these requirements. It removes its members from the undesirable influences of cities and hotels; it provides them sufficient amusement and employment, and while affording plenty of fun and exercise in the open air, reduces to a minimum their opportunities for getting into mischief, and renders it quite impossible for them, in the exuberance of their youthful spirits to become, even unconsciously, a source of annoyance to their elders.

The selection of a site for a camp is of prime importance. It should be far enough away

from other habitations to secure immunity from too frequent visitors, and yet it should be near enough to hotel accommodations to enable anxious mothers to visit their sons without too much trouble and delay. It should be so far away from shops and other village attractions that applications for leave to go to town will not be made for trivial reasons. The location should be, if possible, on a sandy or gravelly formation with sufficient slope—preferably to the south or southwest—to insure good drainage. Pure and abundant drinking-water is essential, and a large body of water, a lake rather than a river, is quite as necessary. The ordinary forest growth of a mountain region is desirable in the immediate vicinity. Spruce, hemlock, pine, and cedar do not generally grow where there are natural malarial conditions, and judicious thinning out will let in enough sunlight to dissipate too dense a shade.

In the matter of shelter, there is a wide diversity of practice. Some of the camps have substantially built log-cabins, others rely upon tents, others upon regular frame buildings, and still others use portable houses, such as were described in the "Annual Cyclopædia" for 1886. In all cases there should be some substantial shelter within reach, available for general purposes at all times and for social resort and refuge in case of prolonged storms.

For many reasons, tents are to be preferred for quarters. The best is the ordinary army regulation wall-tent costing, with a fly or double roof-covering, about twenty-five dollars. Such a tent affords ample quarters for two, and may be made to accommodate four, but this is not desirable. When properly set up and cared for, a tent is proof against the heaviest rain and will stand against any wind of ordinary violence.

One obvious advantage in the use of tents or of easily portable houses is, that they are exposed to the elements only during the period when actually in use. When the summer is over, they are securely stored, and they are as good as ever when the next season opens.

Where permanent structures are used the tendency is naturally toward greater luxury than is compatible with true camp-life, and the health of pupils is not unlikely to suffer in consequence. Colds are almost unknown among soldiers in the field; but in barracks or permanent quarters they are by no means exempt. Floors should be provided for all tents. If made in panels—say two panels to each tent—they can be easily removed and stacked for the winter.

The mess-hall, as it may be called for lack of a better name, need be nothing more than a stout frame building, thoroughly weather-proof and capable of withstanding any wind. Two rooms are desirable—a dining-room and a sitting-room—but it is possible to make one room answer for both purposes. The mess-hall should be raised well clear of the ground, so that wind and weather can sweep underneath during the

winter months. In the case of an established camp, where a large part of the equipment is necessarily left on the ground, some permanent custodian is indispensable, for even in the wilderness valuable property may prove tempting to marauders.

The daily routine of the camp must depend largely upon circumstances, which differ more or less in all cases. There should, however, be regular hours for rising, for meals, and for retiring, as well as for the study-hour, if there is one. In a general way, the daily calls of a military camp may be followed, beginning with reveille and ending with tattoo and taps. If possible, a bugle should be used, but, if not, a whistle is a fairly good substitute. Different calls may be devised for the different offices of the day. The use of some such instrument in preference to a bell, a gong, or a tin horn, is, of course, simply sentimental, but discordant noises seem sadly out of place amid sylvan surroundings. Immediately after reveille, blankets and bedding should, in pleasant weather, be hung out to air, and all hands fall in for police duty, sweeping out tents, and, in general, putting the camp to rights for the day. At a suitable interval after breakfast, an hour or so may be set apart for study; but study from books is properly subordinated to the study of nature, to learning the thousand useful things incident to a self-reliant life in the open air. The successful management of such a camp calls for a combination of qualities by no means common. The superintendent should, in the first place, be thoroughly in sympathy with boys, otherwise he can not enter into the spirit of the situation. He must possess that quality of moral force which commands ready obedience and is capable of enforcing authority. He must, moreover, be a good "all-round" athlete, familiar with boats, a good swimmer, handy with tools, and even capable of teaching a boy to mend his own clothes or repair a damaged tent.

The object of a summer camp is not instruction in the ordinary lines of learning. It is designed to develop the individual resources, to cultivate helpfulness, and enable a boy, should he ever be left figuratively or actually upon a desert island, to make the best of the situation. As little restraint as possible is exercised, but gentlemanly manners are at all times required, and more attention is paid to the manly qualities of truthfulness, honor, and mutual helpfulness than to the learning of schools. The following is an extract from the circular of one of the most successful of existing camps, indicating the outfit required for each pupil:

Three suits of underclothing suitable for summer.

Three suits of pajamas simply made.

The usual toilet-articles.

An *old* thick overcoat, an *old* jacket, a colored flannel shirt, and a pair of slippers will be found serviceable.

One Norfolk jacket, with two stout pairs of knee-trousers.

Four pairs of corduroy stockings.
Two flannel shirts.
One pair of swimming-trunks.
One worsted belt.
One cap, or light felt hat.
One pair of heavy all-wool camp-blankets, gray.
Three pairs of rubber-soled gymnasium shoes.
One pair of stout leather boots.
One pair of rubber boots.
One rubber coat.
No fire-arms will be allowed.

Each boy will be allowed twenty-five cents a week for personal expenses while in camp; it is requested that no other money be furnished to any boy for use during the summer. Necessary additional expenses will be paid by the camp, and an account will be sent to parents.

There will be two terms, the first beginning near the end of June and ending about the beginning of August, and the second beginning early in August and ending early in September.

The fees for the two terms will be \$150; for one term, \$85.

CANADA, DOMINION OF. See DOMINION OF CANADA.

CAPE COLONY, a British colony in South Africa, the form of government of which was established on March 11, 1868. British Caffraria was incorporated in the colony in 1865, and responsible government was established in 1872. The executive authority is vested in the Governor, assisted by an Executive Council appointed by the Crown. The legislative power rests with a Legislative Council of 22 members, elected for seven years, presided over *ex officio* by the Chief-Justice, and a House of Assembly of 74 members, elected for five years. On Sept. 1, 1887 an act took effect giving the Transkeian territories representation in the Legislative Council, and two members in the House of Assembly. The Governor of the Cape of Good Hope is Sir Hercules George Robert Robinson, appointed in 1880. He is also commander-in-chief of the forces within the colony, and High Commissioner for South Africa. The Governor is assisted in his administration by a ministry of five members.

Area and Population.—The area of Cape Colony is 213,686 square miles, including 14,230 square miles in the Transkeian territory. The estimated population of the colony and its dependencies in 1885 was 1,252,347. The total white population is estimated at 300,000. The capital of the colony, Cape Town, had a population of 60,000 in 1886. Kimberley had a population of 25,000, and Port Elizabeth, a population of 18,000 in the same year. During 1886, 4,731 marriages were registered in the colony. Assisted immigration was stopped in 1886. The number of emigrants sent out by the emigration agent in London between 1873 and 1885 was 23,337, the greatest number in any single year being 4,645 in 1882. Basutoland, with an area of 163,000 square miles and 168,000 inhabitants, of whom only 400 are whites, a rich grain-producing district, is administered by a resident commissioner under the High Commissioner for South Africa. Bechuanaland, 180,000 square miles in extent, with a Caffre population of

478,000, and Pondoland, with 200,000 inhabitants, are British protectorates. The Pondos have as yet refused to receive a resident commissioner.

Finances.—The revenue for the year 1888 is estimated at £3,451,000, and the expenditure at £3,110,000. Of the total revenue of the colony, one third is derived from customs, and one third from railways. One third of the expenditure is for the public debt, and one fifth for railways. On Jan. 1, 1887, the colony had a public debt of £21,171,854, besides £1,289,439 raised for guaranteed companies. Colonial paper money has been issued to the amount of £2,860,000.

Commerce.—The total value of imports for 1886 was £3,799,261, and of exports, including specie and diamonds, £7,306,538. For the year 1887 the exports were £7,535,087. The value of the wool exported in 1886, was £1,580,432; ostrich-feathers, £546,230; hides and skins, £397,091; copper-ore, £559,328; Angora hair, £232,184; wine, £23,426; diamonds, £3,504,756. In 1887 the export of diamonds was 8,598,930 carats, valued at £4,240,000.

The number of vessels entered and cleared at the ports of the colony in 1886 was 3,555, having a tonnage of 5,549,217.

The number of miles of state railroads in the colony at the end of 1886 was 1,599; the gross earnings were £1,048,686, and expenses, £646,715. The capital expended on railways to the end of 1886 has been £14,180,616. The net earnings, which averaged 2½ per cent. for the two years preceding, were 4½ per cent. in 1887.

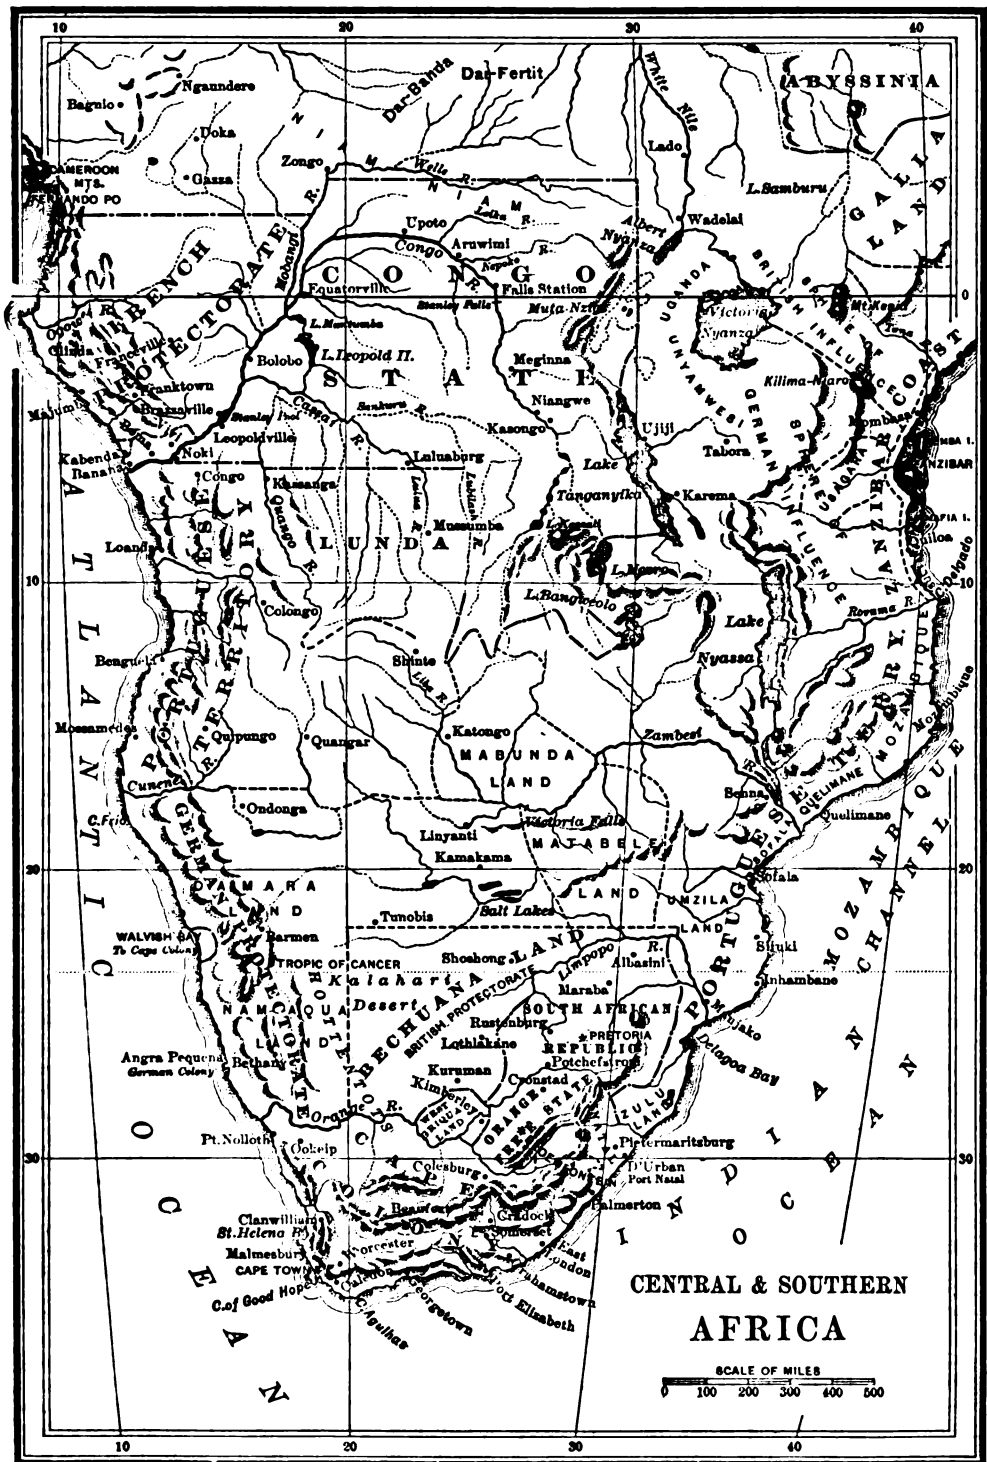

The revenue from the postal service amounted in 1886 to £125,634, and the expenditure to £183,057. The number of letters carried during the year was 6,529,874, and of newspapers, 3,151,835.

The total length of the telegraph lines in the colony at the end of 1886 was 4,329 miles. During the year, 770,500 messages were sent.

Naval Defenses.—The colonial and imperial Governments are jointly fortifying the harbor of Table Bay, the Cape Government providing the labor. Works at Simon's Bay have been built by the British Government.

Natal.—The colony of Natal was separated from the Cape of Good Hope in 1856. The Governor is assisted by an Executive Council, composed of the chief functionaries, and a Legislative Council made up to seven appointed and twenty-three elected members. The present Governor is Sir Arthur Elibank Havelock, who was appointed to the post in October, 1885. The revenue in 1886 was £600,177, and the expenditure £717,414. In 1887 the revenue rose to £816,680, while the expenditure was £689,325. The public debt at the end of 1887 was £4,085,126.

The area of the colony is 21,150 square miles, and the population, as returned in 1886, is 442,697. Between 1878 and 1884, when assisted immigration ceased, 4,526 immigrants

were brought into the colony at Government expense. The white population at the end of 1887 was 85,866. There were 32,312 Indian coolies. One quarter of these are indentured to the planters for a term of five years. The free Indians compete with white mechanics and clerks, and the further importation of indentured laborers, who, after the expiration of their term of servitude enter the field of white labor, meets with strong popular opposition. The native population was 408,922, but of this number more than 225,000 live on reservations, and the colonists are anxious to remove them to Zululand.

The total trade by sea in 1887 amounted to £3,333,000, against £2,333,000 in 1886. The chief exports are wool, sugar, hides, corn, and recently gold, of which £120,021 were exported in eleven months of 1887. A large part of the commerce consists of transit trade with the interior.

Railroads to the Orange Free State and the Transvaal borders were authorized by the Legislative Council in March, 1888, and a loan of £1,500,000 has been raised for the purpose. The development of the railroads to within a short distance of the frontier has assisted the improvement of the trade of Natal, which has greatly increased since the gold discoveries in the Transvaal. The railroad mileage at the close of 1887 was 217, against 195 in 1886.

South African Customs and Railway Union.—A conference of the South African states and colonies to consider the question of railway extension into the republics and an agreement with regard to customs and the collection of duties, which it would necessitate, was called at the initiative of the English, who had neglected the matter of railroad communication with the Orange Free State and the Transvaal until the construction of the Delagoa Bay Railroad threatened to divert the trade of those states and of the central parts of South Africa. Delegates from Cape Colony, Natal, and the Orange Free State met at the conference, which concluded its sessions on Feb. 18, 1888. The South African Republic, which had carried through the Delagoa Bay project in spite of British discouragement, was not represented. The conference agreed on the principle of a uniform scheme of tariffs for the four members of the proposed Zollverein. The duties would be collected at the seaboard by Cape and Natal officials, and the colonial governments would retain one quarter to cover the cost of collection, harbor works, and postal and cable subsidies, paying three quarters into the treasury of the Orange Free State or the Transvaal Republic according to the destination of the goods. To carry out this arrangement, it would be necessary for the Transvaal to enter into a similar agreement with Portugal by which the same rates of duty should be levied on imports brought over the Delagoa Bay Railroad, or, in case the South African Republic declined to enter the union or to impose a duty on goods

entering by way of Delagoa Bay, the Orange Free State must impose duties at its Vaal frontier which shall be equal to the appointed tariff less the Portuguese transit duties. Imports destined for the crown colonies of Basutoland and British Bechuanaland would be subjected to the same maritime duties, and their governments would, like the republics, receive three fourths of the sums collected. A uniform tariff of 12 per cent. was proposed, of which 3 per cent. would be retained as the transit charge. Sir Gordon Sprigg, the Cape minister, who presided, suggested that if the republics both declined to enter into the arrangement, the British Government might agree with the Portuguese Government on a uniform tariff, the British and Portuguese colonial authorities retaining part as transit charges, and paying the difference to the Dutch republics or to inland merchants in the form of a rebate. The conference agreed on specific duties on guns, spirits, tea, coffee, and tobacco; on a free list comprising fence-wire, machinery, railroad materials, printers' material, and pig iron; on a 10-per-cent. rate for agricultural implements, vehicles, and iron manufactures; and on a general tariff of 12 per cent. on all other articles. Between the colonies and states composing the union free trade shall exist, except in spirits and sugar.

Cape Colony agreed to extend its railroad lines to the Orange river near Colesberg, there to join lines that the Orange Free State promised to build northeastward through Blomfontein to Harrismith, and thence through the coal and gold fields to the Vaal river. At Harrismith an extension of the Natal system will join the line.

In Natal, where the existing tariff is 7 per cent., as against 15 per cent. in Cape Colony, there was much opposition to the customs union. President Krüger, of the South African Republic, expressed himself as desirous for free trade with the Free State and the colonies, but his Government was precluded from entering the customs union by a customs treaty with Belgium and an agreement with the Netherlands South African Railway Company permitting goods to be imported by way of the Delagoa Bay Railroad free of duty. The railroad proposals were carried in the Free State Volksraad after a long discussion, by the casting vote of the President, and in the last days of May a large majority agreed to the customs union with the English colonies. During the session a resolution was passed also in favor of federal union with the Transvaal. The Cape Legislative Council in August rejected the proposition of a customs union, after it had been approved by the Assembly. The Transvaal Government agreed to admit imports from the colonies at the same rates as on the Portuguese frontier, and to cancel the concession to the Dutch and German railroad company, remitting duties on freight, on obtaining a pledge from the British Government that it would not

acquire the Delagoa Bay Railroad, which has been built from Lorenzo Marquez as far as the hills bordering the Northern Transvaal territory, and is to be carried across these and extended to Pretoria. The right of Portugal to the country of the Maputos south of Delagoa Bay having been established by arbitration, the Queen of Amatongaland early in 1888 acknowledged the sovereignty of the King of Portugal over this part of her territory. The Cape Parliament authorized the extension of the railways from Colesberg to the Orange river and from Kimberley to the Vaal river. As soon as Parliament was prorogued, on Aug. 17, the Government called a special session to reconsider the customs union tariff bill, and both branches passed it, in order to avert a Cabinet crisis.

Zululand.—On May 14, 1887, Zululand was annexed to the British Empire by proclamation. Mr. Osborn, the resident commissioner and chief magistrate of the new possession under Sir Arthur Havelock, gathered such of the Zulus as would accept his invitation at Nkonjeni on July 7, where he hoisted the British flag and read the proclamation. Usibepu, the most powerful of the chiefs among whom the British had partitioned the country after the deposition of King Cetewayo, who had been permitted to retain his territory in the north-east on the king's restoration, was beaten by the Usutus, or Zulna, who were attached to the dynasty, under Cetewayo's son, Dinizulu, and was driven into the Zulu Reserve. After the annexation, as soon as laws and regulations had been made for the territory, the British made preparations to restore their ally and his followers to the lands from which they had been expelled, but deferred their intention when Dinizulu and Umyamyana made preparations to drive out the renegades again. Dinizulu retired into the New Republic, but came back after vainly imploring the Boers to join him in an attack on the British and their Zulu allies, and became involved in a quarrel with another chief. Both were summoned before the special commissioner to have their differences settled. Dinizulu was at first contumacious, but on Nov. 14, 1887, they both appeared and were ordered each to pay a fine of cattle. At the end of that month Usibepu and Sokwetyata, another chief who had fled into the Reserve, were restored. In January, 1888, Usibepu attacked a kraal belonging to some of Dinizulu's people, seized their cattle, and drove the Usutus off the land. Dinizulu again went to the New Republic to ask the assistance of the Boers. While he was absent, in April, some police who attempted to make arrests at the kraal of Undabuko, his uncle, were forcibly ejected. In May Dinizulu fell upon the chief Humelane and recaptured stolen cattle. The Zululand police, with an escort of dragoons, proceeded to execute warrants of arrest against him and other chiefs. Dinizulu and Undabuko collected their followers at Ceza, in the ex-

treme northwest, and compelled the British force to retreat after sharp fighting, in June. Zulus who were loyal to their king, Dinizulu, then rose in rebellion in all parts of the country. Store-keepers in different parts of Zululand were murdered, and natives who were friendly to the English were plundered. On June 23 the Usutus attacked Usibepu, who had raised an impi at the call of Governor Havelock, and routed his force inflicting heavy losses. Usibepu fled, with the police at Ivuna, who were also attacked. The English raised levies of natives in Basutoland and the Reserve, and sent them under European leaders to quell the rebellion, while troops were moved forward from Durban to the frontier, and from Cape Town to Durban, and re-enforcements were even sent from England and Egypt. Lieut.-Gen. Smyth, commanding the British forces in South Africa, went to Zululand to direct operations. A body of troops, native levies, and police advanced from Nkojeni against the Usutus under a brother of Cetewayo named Tshingana, at Illopekulu, near White Umvolosi river, and defeated them, after six hours' fighting, on July 2, losing two white officers and a large number of natives. Usutu chiefs looted Sokwetyata's cattle and attacked the magistrate of Inkhandla district. In the beginning of July Somkeli and his vassals rose in the Umvolosi district against Mr. Pretorius, the sub-commissioner, and other chiefs on the coast near San Lucia joined the rebellion. Before marching upon Ceza, where Dinizulu had been joined by his loyal subjects from all parts of Zululand, and had a force of 4,000 warriors, Gen. Smith sent an expedition to the Umvolosi. Somkeli surrendered voluntarily, and ordered his under chiefs to desist from hostilities. Other columns dispersed the minor insurgent forces in the south and east of Zululand. The general waited for levies of Zulus and Basutos, but these never came except in small numbers. Sir Arthur Havelock did not share the current opinion as to Dinizulu's guilt, and was anxious to save the Zulus from a war of extermination, and hence arose the usual differences between the civil and the military authorities. The only considerable native force that was raised was John Dunn's impi, numbering over 1,500 warriors, which took part in the reduction of Somkeli near San Lucia. The British forces, numbering about 2,000 British regulars, besides police, Natal volunteers, and native levies, began to move on Ceza in the early part of August, establishing military stations at various points. Dinizulu and Undabuko, whose followers had dwindled to 1,000 men through hunger and cold, fled into the Transvaal. The Zulus several times attacked the British posts and flying columns, and raided the friendly natives in the Reserve. Usibepu, the prime mover of the troubles, was supported, if not instigated, by the Natal colonists and officials, who have shown uniform hostility to the royal family of Zululand, and a determina-

tion to uproot the loyal attachment of the Zulu Caffres to their hereditary kings. The murders and robberies of the English *protégé* first drove Dinizulu and his starving followers to acts of retaliation. Usibepu's people also invaded Swaziland, and killed men and women on the pretence that the Swazis had helped Cetewayo. The revolt of Somkele was due to an unjustifiable attack by Usibepu, who had been admonished to keep quiet by the British authorities. Dinizulu gave himself up in September to the Transvaal authorities on a promise that he should not be surrendered to the English, who willingly acquiesced in an arrangement that relieved them of the responsibility of putting him on trial for his life. Undabuko made his escape into Amatongaland, but afterward delivered himself up to the civil authorities at Nkojeni. The British Government announced the intention of maintaining Zululand as a permanent possession. Gen. Smyth, who arrived at Nkojeni on August 1, left Zululand in the beginning of September, leaving an army of occupation consisting of 1,500 troops.

The New Republic.—After Cetewayo was allowed to return to Zululand, Usibepu made war on him and compelled him to take refuge in the Zulu Reserve, where he died. His people, the Usututs, under Undabuko and Dinizulu, obtained the assistance of Transvaal Boers by ceding to them the third part of Zululand, and defeated Usibepu, who in his turn fled into the Reserve. The Boers formed the New Republic of Western Zululand on the lands that had been sold to them, and acquired others on the sea-shore. The British, in response to an appeal from the Usututs themselves, interfered, and induced the Boers to give up the latter, except such as were actually occupied, and to forego their claim to a protectorate over the whole of Zululand, by conceding their right to the territory of Western Zululand, and formally recognizing the New Republic. In October, 1887, a treaty of union was concluded between the South African Republic, formerly called the Transvaal, and the New Republic of Western Zululand. The treaty was ratified by the Volksraad of the South African Republic when it met in May, 1888, and also by that of the New Republic in June, subject to the approval of the British Imperial Government, in accordance with the treaty concluded after the Transvaal war, which placed the foreign relations of the republic under the suzerain control of Great Britain. Gen. Joubert and another commissioner were sent from Pretoria to take over the government of the New Republic, and when the reorganization was effected Lucas Meyer, the former President, was left at the head of the administration, with the title of Border Commissioner.

Boer Invasion of Khama's Territory.—The territory lying between the Macloutsie and Shashi rivers has for some time been the subject of dispute between Khama, the chief of the Ba-

mangwatos, and Lobengula, king of Matabeleland. The Transvaal Boers, in order to forestall the English, who, having ousted the Dutch from Bechuanaland, apportioned the best farming-lands among immigrants of British birth, made a ferry across the Crocodile river, just below the mouth of the Macloutsie, with the object of taking possession of the disputed tract under grants that had been issued to Boer citizens some time before. A Transvaal Boer named Grobelaar, in July, 1888, went with an escort as special envoy of the Transvaal Government to Lobengula. When the Boers were returning through the debatable ground, in order to cross by the ferry, Chief Khama forbade them the right of passage, and when Khama sent some men to stop them, the Boers took away their guns. A stronger party was sent to retake them, and this was fired upon, but Khama's people returned the fire, and charged on the Boers, who fled after two of them had been killed and the commander and another wounded. The scene of the fight was on land that has been in dispute between Khama and Lobengula, and lies just within the British protectorate. The High Commissioner asked for explanations from the Transvaal Government, which had nominated Grobelaar an envoy to Lobengula. Khama collected a force of 3,000 men armed with rifles, besides 800 horsemen with Martini-Henry breech-loaders, and was joined by a band of British border police. A force of Transvaal Boers was encamped on the opposite bank of Crocodile river, in readiness for action, while the matter was being investigated by commissioners of the British and the Transvaal Governments. Gen. P. J. Joubert and H. Pretorius were the representatives sent from the Transvaal to co-operate with Sir Sidney Shepard, the administrator of Bechuanaland, in an inquiry into the facts. The incident led to the important intimation being made by Sir Hercules Robinson, under instructions from the British Government, to the President of the South African Republic, that the Matabele, Mashona, and Makalaka territories, and the northern part of Khama's territory, as far as the Zambezi, are solely within the sphere of British influence. Lobengula, the Matabele king, concluded a treaty with England in April, by which he bound himself to refrain from entering into any correspondence or treaty with any foreign state or power to sell or cede any portion of his dominions, including the tributary territories of Mashona, Maka, and Malaka, without the previous consent of the British High Commissioner. The Transvaal Republic was cut off by this treaty from any extension northward, except with the sanction of the British. The Boer Government therefore sent Commander Grobelaar to Lobengula to remind him of a previous treaty that he had made with the Transvaal, but the chief of Matabeleland refused to discuss the subject. Grobelaar died of his wounds two weeks after the affray with Khama's men. Another fight took place be-

tween Mokhuchwane, the headman who had stopped Grobelaar, and two traders named Francis and Chapman who attempted to cross by the same ferry. At the request of President Paul Krüger, of the South African Republic, the British Imperial authorities, in the summer of 1887, modified the original proclamation of the protectorate up to 22d parallel of latitude, by fixing an eastern limit at the longitude of the mouth of the Macloutsie. The Boers claimed not only the right to the route through the disputed territory and grants of land within it, but also a protectorate over Matabeleland, by virtue of a treaty that they made with Moselekatzé, the grandfather of Lobengula.

German Colonization and British Expansion.—The British port of Walfisch Bay is the only good harbor on the entire seaboard of German Southwest Africa, extending through twelve degrees of latitude, and it gives access to the two principal rivers running through Damaraland and Namaqualand. The bay of Angra Pequena in the south has disappointed the expectations of the Germans, while Porto do Ilheo or Sandwich Haven is small and threatened with obstruction by sand. The Germans are indignant that Great Britain should desire to retain this *enclave*, only twenty-five square miles in extent, which is absolutely useless since the German annexation of the country. The English Government might be willing to exchange it for Togoland, which is a similar source of annoyance in the midst of British possessions on the Gold Coast, but fears the dissatisfaction of the Cape Colonists. In April, 1888, Nama robbers made an attack on the little English settlement, which was only saved from massacre by the timely dispatch of troops from Cape Colony. The Cape Government complained to the German Governor that the protectorate had not been made effective. After the withdrawal of British protection, which was likewise only nominal, and was formally renounced in 1880 by the English Government, Germany proclaimed a protectorate over Damaraland, or as the Germans sometimes call it Hereroland, comprising the region between the Orange and the Cunene rivers, by virtue of a treaty made with the head-chief Maherero by the Lüderitz Company, which had undertaken to work the abandoned copper mines. The enterprise proved unprofitable, as it had before in the hands of the English, on account of the cost of carrying the ore to the coast, and the company failed in its duty to maintain order, and afforded no protection to the disappointed Hereros, whose herds of cattle suffered, as before, from the black-mailing incursions of the vengeful Nama Hottentots, once the masters of the whole country, but now confined to their robber-nests in the mountains of southwestern Hereroland. Anarchy and disorder reached such a degree that in 1887 German officials were repeatedly attacked and the horses and cattle of the imperial commissary were stolen. The new Boer republic of Upingtonia in the

northeastern part of the German possessions, toward Ovamboland, was brought to the verge of dissolution by attacks of the Zwartboy Hottentots and fights with Bushmen. Discoveries of paying gold-quartz in Hereroland are likely to revive the fortunes of the earliest, but most neglected, of the German colonial possessions, and may induce the German Colonization Society for Southwest Africa, which has succeeded the Lüderitz corporation, to give the promised police protection. An Englishman named Stevens, when leaving the copper mine back of Walfisch Bay in 1857, took with him a fragment of rock of curious appearance. Many years afterward he went to live with his sons, who were gold-miners in Australia. On seeing auriferous quartz he was struck by its resemblance to his specimen, which was produced, and was found on analysis to be a rich piece of gold ore. After his death two of his sons, with two companions, went to Walfisch Bay to prospect, arriving in October, 1887. They obtained permission from the German authorities, who placed little faith in their story or in their prospects of success, since several expeditions of scientific geologists had failed to make any promising discovery. These practical miners, nevertheless, found paying rock within a few weeks. The richest vein is on an island in Swakop river near Walfisch Bay. The natives as soon as they saw what was wanted brought sacks of gold quartz to Stevens from various quarters, showing that there are extensive gold fields. In quality the ores are said to compare favorably with those of the best Californian or Australian workings. The Australians were employed at first by the Colonial Society, but since March, 1888, their operations have been conducted for the account of a branch syndicate that has the monopoly of the gold mines. The German Colonial Society for Southwest Africa has recently designated only the northern part of its possessions, extending from Swakop river to the Portuguese boundary at the Cunene, as German Damaraland, while the region between Swakop and Orange rivers is officially known as German Namaland. The German protectorate includes some fertile land in the north, resembling the neighboring Portuguese possessions. The greater part of the country, however, is only fit for grazing, and is so poorly watered that the herds of its 200,000 inhabitants, scattered over 290,000 square miles of territory, find only a scanty herbage. There is a small export trade in cattle, but the commerce is much smaller than formerly. The German West African Company is an enterprise distinct from the colonization society that succeeded Lüderitz, and has for its object the development of trade with the interior. The English Government, by the occupation of Bechuanaland, had driven a wedge between the German possessions and the Transvaal, and by the annexation of San Lucia Bay and the extension of its suzerainty over Amatongaland, had shut out German influence from the east

coast. The region south of the upper and middle Zambesi was still considered a prospective field for German enterprise and a path by which Germany might in the future reach the Boers whom the hated English have walled in from the outside world. The Delagoa Bay Railroad is, indeed, a German enterprise, but British influence is predominant at Lisbon, and Delagoa Bay territory is likely soon to become English by purchase. The British announcement that the entire region south of the Zambesi, as far west as the actual bounds of Damaraland, is within the sphere of British interests was intended to warn the Germans away from the rich but undeveloped commercial field of central South Africa, and to hem in the independent Boers on the north side also. England bound herself by a memorandum agreement not to extend her dominion westward beyond the 20th meridian. She now asserts her ultimate claim to the whole interior east of this line. A mere announcement does not accomplish that object except in respect to the Transvaal Republic, which dare not now officially organize annexations northward. But while the Germans are dreaming of commercial routes across the Kalahari desert, the English are extending the Northern Cape Railroad to the Vaal river, and soon English companies will be working the gold-bearing ledges that are known to exist in Khama's kingdom and Mashonaland, where many locate the gold-mines of ancient Ophir. Two syndicates obtained conflicting mining rights in the disputed tract between the two kingdoms, one of them from Khama and the other from Lobengula, but on the advice of Sir Theophilus Shepstone both concessions were canceled. The influx of English capital and settlers into the Transvaal gold-fields promises in time to give the Anglo-Saxon race the same social and political ascendancy in the Boer republic that they have at the Cape. Gold exists in South Africa only in lodes of rock, and must be worked with steam machinery and expensive stamps. The emigration is therefore not of the adventurous and migrating kind that is attracted by alluvial washings, but consists of skilled laborers who will be permanent residents unless the seams give out. The Transvaal authorities maintain good order, and in return the mine-owners willingly pay special taxes, and not only support the greatly increased expenses of Government, but fill to overflowing the treasury of the republic, which a few years ago was bankrupt, owing to the aversion of the Boers to paying any taxes at all. The British are desirous of using the Zambesi as a route to the central parts of South Africa, but are hindered by the tolls and import duties exacted by the Portuguese Government.

CAR-BUILDING. Fifty years ago a few wheelwrights and carriage-makers were experimentally engaged in adapting the four-wheeled road-wagon of the period for use on a tramway. There was no "car-building indus-

try" in existence. To-day more than 15,000 men earn their bread by constructing railway-carriages of various kinds, and 500,000 earn their living through the management of the carriages after they are built. There were then in service a few tram-cars of comparatively rude construction, drawn by horses for the most part, and designed for the transportation of passengers or freight over short distances. Now it is estimated that there are in use about 78,000 cars, of all descriptions, drawn by nearly 80,000 locomotive-engines, over 150,600 miles of track. These figures are substantially from Poor's "Manual of Railroads," the accepted authority on the subject. There are about 140 car-building establishments in operation in the United States, and not only do these turn out cars for ordinary passenger traffic and for miscellaneous freight and merchandise, but they build vestibule and palace "coaches," restaurant or buffet cars, observation cars, mail, express, refrigerating, and milk cars, menagerie and circus cars, and cars for the different kinds of live-stock. Some of these latter are so complete in their special appointments that they are not inaptly termed "palace-cars" after their kind, the latest addition to the list being a "palace-car for hens," designed for the conveyance of from 3,500 to 4,500 live fowl, in comparative luxury. This car is described as two feet higher than the ordinary freight-car; it has two aisles, one longitudinal the other transverse. It is partitioned off into 116 compartments, each four feet square. Food is carried beneath the car, and water in a tank on top; the supply being sufficient for a full load for a journey of 2,000 miles. The "Car-Builders' Dictionary" specifies regular car-types as follows:

Baggage-car, boarding-car, box-car, buffet-car, caboose or conductor's car, cattle or stock car, coal-car, derrick-car, drawing-room car, drop-bottom car, dump-car, express-car, flat or platform car, gondola-car, hand-car, hay-car, hopper-bottom car, horse-car, hotel-car, inspection-car, lodging-car, mail-car, milk-car, oil-car, ore-car, palace-car, passenger-car, pay-car, post-office car, push-car, postal-car, refrigerator-car, restaurant-car, sleeping-car, sweeping-car, tank-car, tip-car, tool or wrecking car, three-wheeled hand-car.

This list is confessedly incomplete, for new devices are continually added to meet the demands of the time.

J. E. Watkins, of the National Museum in Washington, in his reports on the Department of Transportation, gives a history of car-building, which places its origin at the beginning of the century, when active brains in this country and in England perceived the advantages of tramways for the transit of wheels. In 1812 John Stevens published a pamphlet explaining the advantages of railway travel, and expressed the belief that passengers might by this means be carried at the rate of one hundred miles an hour. The highest speed yet attained does not fully realize this dream, but it would be rash to say that such a feat will

never be accomplished. About 1819 Benjamin Dearborn, of Boston, petitioned Congress in regard to wheeled-carriages for the conveyance of mails and passengers "with such celerity as had never before been accomplished, and with complete security from robbery on the highway." His memorial points to the sleeping-car and the train-restaurant as among the possibilities of the future. But Congress was indifferent then, as now, to matters outside of practical politics, and the committee to whom the matter was referred never saw fit to rescue it from oblivion.

In the mean time the problem had been successfully solved on the Stockton and Darlington Railway in England, and in 1825 William Strickland was sent abroad in the interest of the Pennsylvania Society for the Promotion of Internal Improvement. As a result of his reports on English railways, private enterprise took courage in America. The first cars here, as in England, were constructed for tramway service. They were in connection with the granite-quarries at Quincy, Mass., and in Delaware County, Pa., in 1826; and in 1827 a coal-road nine miles long was opened from the Mauch Chunk mines to Lehigh river. The rolling-stock of these early roads was the work of wagon-builders, whose purpose was merely to mount stout boxes upon wheels suitable for running upon rails. The complicated problems of oscillating trucks and passing curves at high speed came in later.

The early annals of car-building are necessarily somewhat incomplete. One of the first references to the infant industry is found in the Philadelphia "American Daily Advertiser," under date of Nov. 26, 1832. It describes the trial trip of the locomotive built by M. W. Baldwin, of that city:

It gives us pleasure to state that the locomotive engine built by our townsman, M. W. Baldwin, for the Philadelphia, Germantown, and Norristown Railroad Company, has proved highly successful. In the presence of a number of gentlemen of science and information on such subjects, the engine was yesterday placed on the road for the first time. All her parts had been previously highly polished and fitted together in Mr. Baldwin's factory. She was taken totally apart on Tuesday and removed to the company's depot, and yesterday morning she was completely put together, ready for travel. After the regular passenger-cars had arrived from Germantown in the afternoon, the tracks being clear, preparation was made for her starting. The placing the fire in the furnace and raising the steam occupied twenty minutes. The engine (with her tender) moved from the depot in beautiful style, working with great ease and uniformity. She proceeded about one half a mile beyond the Union Tavern at the township line, and returned immediately, a distance of six miles, at a speed of about twenty-eight miles to the hour. Her speed having to be greatly slackened at all road-crossings, and it being after dark, but a portion of her power was used.

It is needless to say that the spectators were delighted. From this experiment there is every reason to believe that this engine will draw thirty tons gross, at an average speed of forty miles to the hour, on a level road. The chief superiority of this engine over any of the English ones, now consists in the light

weight—which is but between four and five tons—her small bulk, and the simplicity of her working machinery. We rejoice at the result of this experiment, as it conclusively proves that Philadelphia, always famous for the skill of her mechanics, is enabled to produce steam-engines for railroads, combining so many superior qualities as to warrant the belief that her mechanics will hereafter supply nearly all the public works of this description in the country, and by our superiority in the adaptation of this motive power, as we have hitherto in navigation, perhaps supply England herself. By the company's advertisement in to-day's paper, it will be seen that this engine will take her place regularly on the road this day.

Cars are here mentioned, incidentally as it were, in connection with the new locomotive, but the citation proves that the "regular passenger-cars" were already familiar to the public. Other early allusions are somewhat uncertain as to date. About 1830 "Peter Parley" wrote:

Now, in order to carry on all this business more easily, the people are building what is called a railroad. This consists of iron bars laid along the ground, and made fast, so that carriages with small wheels may run along upon them with facility. In this way, one horse will be able to draw as much as ten horses on a common road. A part of this railroad is already done, and, if you choose to take a ride upon it, you can do so. You will mount a car something like a stage, and then you will be drawn along by two horses, at the rate of twelve miles an hour.

Such was the beginning of the Baltimore and Ohio Railroad, now known so familiarly to millions of people that it is called the "B. & O." for short. Its construction was begun in 1828, and the first section of fifteen miles was ready for traffic in May, 1830. Fig. 2 is the sketch, probably somewhat fanciful, that accompanied Peter Parley's description.

In November, 1832, an advertisement appeared in Philadelphia papers in the interest of the Philadelphia, Germantown, and Norristown Railroad, in which, after the schedule of trains, was the following paragraph:

Passengers wishing to take a short excursion will find this a very pleasant one. The scenery along the road is very beautiful, and at Germantown Mr. Wunder's hotel is fitted up in a style that will render comfort on a warm day, as refreshments of the best quality and in abundance will be constantly on hand; and persons wishing to take a walk in the fields will find the scenery on the Wissahickon very romantic and beautiful, and but a few minutes' walk from the railroad.

The firm of Kimball & Davenport, of Cambridgeport, Mass., was probably the first in the United States to take up car-building on a large scale. They entered upon the business in 1834, and for twenty-two years were among the leading establishments in that branch of industry. Charles Davenport was the active member of the concern. He delivered his first passenger-car to the Boston and Worcester Railroad in the spring of 1835. It was a departure from the English coach-body pattern, though it retained the side doors. The seats all faced one way, which necessitated turning the car at the end of the route. Mr. Davenport soon devised reversible seats, but did not patent them, and

they presently became public property. He patented and used a buffer coupling arrangement, with double-acting draw-springs. In 1838 he built the first eight-wheel passenger-car, with seats for sixty persons, and to his enterprise and ingenuity were largely due many of the improvements in car-building that were made prior to the civil war.

The managers of the Delaware Car-Works, of Wilmington, have kindly furnished from their files the following account of the oldest passenger-car now in use, "Morris Run, No. 1," constructed for the Tioga Railroad Company, and delivered complete, according to contract, the 10th of September, 1840. This may be taken as representing the best type of passenger-car then constructed:

This car has been in continuous service from that date up to the present time. It was placed on exhibition at the Chicago Exposition of Railway Appliances, held in 1883, as an illustration of the durability of passenger-coaches when constructed of the best materials, as well as to furnish an historically interesting and instructive comparison between the earliest and later types of railway-carriages. This car was constructed upon an order for "one first-class passenger-car," to be finished in every respect in a "highly modern" manner, with all the latest improvements. It was styled in the contract "An eight-wheeled passenger and ladies' accommodation car," and was intended to excel anything of the kind then running in the country. Although at this late day we can scarcely realize the actual state of things as they then existed, owing to the vast improvement which has taken place since, it is fair to assume that the car "Morris Run, No. 1," when it left the shop did equal and perhaps excel its kind in beauty of finish, in comfort of appointments, and in excellence of arrangements. Its extreme age and the fact of its still remaining in service after the lapse of almost half a century, attest beyond question the thoroughness of its construction and the quality of the materials used.

The general dimensions of the car were as follow: Thirty-two feet in length of frame; 8 feet 6 inches in width of frame; 6 feet 4 inches in height from floor to ceiling (no raised floor). For this "eight-wheeled ladies' car," built with continuous framing, solid bracing, double uprights, stationary sash, Venetian blinds, and dead-light neatly trimmed, the price charged was \$2,000, delivered free on board of a vessel at the wharf of the builders. It may be added that for some heavy wrought-iron brace-rods, studs, and bolts, thought necessary for extra strength in the bodies, an additional sum of \$40 was afterward allowed, bringing up the price to \$2,040. This figure, however interesting it may be in the light of modern comparisons, when the cost of a first-class passenger-car ranges, depending upon the details of the finish and fittings, anywhere from \$4,200 to \$5,500, must not be considered as a wholly trustworthy basis of relative costs in labor and materials in those early days compared with the present costs for the same structure. We must bear in mind the various improvements that have since entered into the construction of a car as elements of increased expense, such as the monitor roof with its glazed deck-sash; the decorated head-lining or ceiling; the patent couplers, buffers, etc., with wider and heavier platforms, built as a part of the car-floor framing; the elaborate chandeliers, bracket-fixtures, trimmings, basket-racks, and hardware generally, as well as the compartment conveniences, such as closets, wash-stands, water-coolers, etc., that go toward completing a modern coach. The single item of trucks alone has been developed in the direction of safety, elegance, and durability far beyond the dreams of inventors in 1838.

The patent lead-lined anti-friction journal-bearings, the patent oil-boxes, springs, equalizing devices, improved body-bolt bearings, with collateral safeguards in the way of safety and check-chains, the air-brakes, and iron truck-framing—all these contribute nowadays not only to the superiority of the car, but to its greater cost, to say nothing of the use of refined steel for the axles, springs, etc., and the complex and numerous patented designs of the modern wheel itself. The matter of upholstery and decoration inside and out, the use of hard woods highly polished, the ornate carving upon the paneling inside, the patented designs of seat-frames, the expensive method of heating, the improved style of glazing and ornamentation—these likewise form a part of the modern car, and must be counted as elements in any comparison of the old with the new.

It will readily be seen, therefore, that at \$2,040, with the cheaper labor and material of those days, and eliminating the many sources of expense incurred at present in car-building, the "Morris Run No. 1" was a fair specimen of the best class of coach that it was possible to turn out at that time. The windows of this car had the peculiarity of being glazed in solid, without any sash (presumably on account of the early fear lest, if the windows were opened, accidents would be sure to follow), and the wooden panels forming the sides of the car were made to open by sliding the lower half up inside of the upper half. These panel-openings were very narrow, and were intended for ventilation rather than for sight. As may be imagined, this gave the car a very odd appearance upon the outside. Yet it was by no means a bad idea, since, in the first days of railroading, before the passengers had become accustomed to the novelty of this rapid form of locomotion, and equally familiar with the dangers of night-seeing through the side-openings while in motion, it proved a source of safety, which should at least entitle it to our lenient criticism.

The car had no raised roof, the upper boarding being laid on flat from end to end, and extending somewhat beyond the body for protection to passengers while alighting. Just when this feature of hoods was adopted it is difficult to say—in fact, the whole design of the "Morris Run No. 1" was a total departure from the then old-fashioned standards of railway-carriages in use abroad and copied in this country. The latter were simply the ancient form of swinging stage-coach bodies, placed on long frame-trucks in sets of three, with side-openings in the shape of the primitive coach-doors, a horizontal plank for the side-step, and with a single pair of open-spoke iron wheels under each coach-body. At the ends were great cog-brakes extending to the brakeman's seat upon the top of the coach, from which position he could see the signals of the driver, and be governed accordingly.

Four-wheeled passenger cars were used at this time, and the body was suspended upon leather thorough-braces, similar to the old-fashioned Concord coaches. The seats were placed around on the inside, so that the passengers were facing each other. A double row of seats was placed upon the top of the cars also, where the passengers sat back to back. When collecting fares, the conductor did not enter the cars for that purpose, but passed around on the outside upon a foot-board. There were no brakes, either on the engine or on the cars; consequently the train had to be stopped by reversing the engine. Sometimes the eccentrics would catch on the center, so as not to revolve, in which case the engine could only be started by some application of mechanical force.

The wood-working tools consisted of but two or three machines, the perfected machines of those days consisting of a circular saw and Daniel's planer, which could plane but half a car-sill at one motion, the piece being taken out and reversed after each motion, and a very limited assortment of other primitive appliances of a like degree of adaptability. Now, the labor-saving machines could be enumerated by the score, and the Daniel's planer has been supplanted

by a powerful machine, planing all four sides at once, while machines for mortising square holes, for carving, for scraping lumber, so that it does not have to be treated with sand-paper, and numerous other inventions have added to the car-builders' facilities.

The shops at this period were constructed to take cars not over forty feet long, as their standard length was but thirty-nine feet, while nowadays they are often nearly double this length; so that with each decade, as railroad-building has increased and travel became more general, the equipment was made correspondingly larger and stronger and more comfortable, until to-day the finest day-coaches rival the best parlor-cars in all essentials for the comfort of travelers, being equipped with lavatories, hot-water and steam-heating apparatus, gas, electric lights, and luxurious upholstery, while every year additional appliances are introduced for comfort and safety.

Referring to the illustrations in detail: Fig. 1 shows what is believed to be the first rail-car ever constructed exclusively for passengers. It was designed by George Stephenson for the Stockton and Darlington Railway (England) in 1825, and for several years such cars were in use on that road, especially in summer. They were without roofs and were designed only for fair-weather service. Fig. 2 has been already referred to. Figures 3, 4, and 5 are types of what may be termed the "coach-body car." Fig. 5 represents a car imported from England for use on the Albion Railroad in Nova Scotia, where it was in service for several years. It had seats for only four passengers. Fig. 6 is the side elevation in detail of a coach-body car, a working plan in fact for the guidance of the builders, and as such is no doubt the most accurate representation in existence of this type. The original drawing was made in 1831 by John B. Davis, a resident engineer, and is certified by James Goold, then, and for years afterward, a builder of cars and carriages in Albany, N. Y.

It soon occurred to American builders that it would be a distinct gain to reduce the number of wheels and increase the carrying capacity by uniting several of these coach-bodies, as in Fig. 7; and it is curious to note that the curved body-lines are still retained by modern English builders, while American builders early discarded them for straight frames, which are obviously superior constructionally to the curved type. In Fig. 8 is shown what was probably the first car constructed with a raised roof, designed to afford more head-room, and to bring the center of gravity as near the ground as possible. The end compartments contained toilet arrangements and a refreshment-room or bar. The passengers sat back to back, facing outward along a longitudinal partition. This particular car was called the "Victory," and the design was patented by Richard Imlay. It was in use on the Germantown Railroad in 1836, and was undoubtedly the pioneer of the "monitor" roofs. The increased length and weight of cars led to the invention of the "bogie" or eight-wheeled truck, which is generally regarded as an American invention, but which Mr. Watkins finds described in an English pamphlet, by Thomas Tredgold, as early as

1827. He is unable to learn, however, that it came into favor in England before 1860, while it was in general use on the Baltimore and Ohio Railroad as early as 1835. Fig. 9 shows the ordinary first-class passenger car in frame and complete, substantially as used at present on all American railroads.

The now familiar type of car-wheels was not reached without a vast expenditure of time and money. At first they were made with detached spokes, but the advantage of solid iron plates was soon recognized, and for many years chilled cast-iron wheels were used almost exclusively on American roads. The improved methods of making steel have rendered it possible to use a stronger, lighter, and more durable material, and wrought-iron wheels, with steel tires, are now largely employed. For sleeping-cars, wheels constructed partly of paper are extensively used. A disk four inches thick is formed by gluing together numerous sheets of specially prepared paper-board. These are dried under heavy pressure and fitted around a cast-iron hub, which is provided with a flange. The circumference of the disk is trimmed in a turning-lathe to fit the steel tire, and finally two thin wrought-iron plates are placed on either side of the paper disk, and the whole is fastened together with twenty-five or thirty small iron bolts. Wheels constructed on this plan are peculiarly "easy riders," the weight falling on the edges of the combined sheets of paper-board, which insures an exceptionally even distribution of strains.

Palace, parlor, and special or private cars are the latest development of American ingenuity. In perfection of construction and equipment they far exceed anything of the kind built abroad, and have to a considerable extent found favor on transatlantic lines. The very latest improvement is the "vestibuled train" whereby several parlor or other of the costlier kinds of cars are coupled together, forming in effect one continuous vehicle, dust, smoke, and cinders being wholly excluded and a supply of pure, fresh air admitted at the forward end. The flat frame, marked A, is attached to a hood of flexible material folded so as to expand and contract like the bellows of an accordion. When two vestibuled cars are coupled, as in Fig. 11, the frames are locked together, and the hoods are kept extended by powerful springs, so that the whole train is homogeneous.

The dimensions, cost, etc., of the ordinary types of cars, as at present used on American railroads, are as follow:

CLASS.	Length.	Weight.	Price.
	Feet.	Pounds.	
Platform or flat car.	84	16,000 to 19,000	\$850
Freight or box car.	81	22,000 to 27,000	550
Refrigerator-car.	30 to 84	28,000 to 84,000	800 to 1,100
Passenger-car.	50 to 62	45,000 to 80,000	4,400 to 5,000
Drawing-room car.	50 to 65	70,000 to 90,000	10,000 to 20,000
Sleeping-car.	50 to 70	60,000 to 90,000	12,000 to 20,000
Street-car.	16	5,000 to 6,000	800 to 1,300

CHARITY ORGANIZATION, the banding together of all benevolent agencies, municipal, institutional, and private, for the better administration of charity and for a study of the causes and cure of pauperism. (For a full definition of charity organization and a history of the New York City Charity Organization Society, see "Annual Cyclopædia" for 1885.) The fundamental idea of charity organization is that pauperism is a disease of the body politic and must be dealt with on scientific principles; that all the problems of modern social, industrial, and political life affect the great question of pauperism; and that experience teaches that its scientific solution is possible. Charity organization has elevated to a profession the practical dealing with this problem.

Aims.—It is a false idea that the aim of charity organization is to relieve the rich from imposture. Its aim is rather to enlist the rich in an attempt to change the conditions of distress. The warfare that in its preventive work it wages against imposture is for the sake, not of the rich, but of the poor, because of the demoralizing effect upon character of successful imposture, because of the check upon liberality, and because money given to fraudulent cases is so much diverted from the truly needy. Saving money to the country is not the object, but an incident of its work.

Methods.—The methods of charity organization are of two kinds—preventive and constructive. The former includes the detection and suppression of frauds, a search into the causes of the poverty of individuals, and the securing of adequate and suitable relief where relief is needed. For these purposes it makes use of investigation, registration, conference, and co-operation, acting on the principle that the organization of charitable work is the most effectual means of preventing poverty, as the organization of labor is an efficient means of increasing wealth. On this principle it is an agency for the collection and diffusion of intelligence, its business being not to distribute alms, but to show those individuals, churches, societies, and public authorities who do, how to make the most of their bounty. It is not a relieving agency; it discovers difficulties, and society finds the means of meeting them. In constructive work it includes both the rich and the poor, aiming to educate both classes in their relative duties, to break down class prejudices, and to build up the character of the poor. The first of these objects it seeks to attain through direct teaching in churches, in educational institutions, and through the press; the second by establishing friendships between individuals of both classes through its system of friendly visiting; and the third by the personal influence of the friendly visitor, educating the poor in courage and hope, in providence and skill, and by bringing reformatory influences to bear. In recommending individuals for relief, the question is never, Is he worthy? but, Will relief make him better?

The preventive work of organized charity includes, in Syracuse a Society for the Prevention of Cruelty to Children; in Philadelphia an excursion fund for women with infants or sick children; in Buffalo, Brooklyn, and Orange, N. J., day nurseries; in Wilmington, Del., the regular visitation of the almshouse and of the Boys' Reform-School. Five cities maintain labor-bureaus or work-exchanges, five have wood-yards, seven have wayfarers' lodges or friendly inns, nine provide sewing for women, three have laundries, and a fourth—New York—is taking steps toward opening one. Indianapolis has free baths, and makes a special feature of Thanksgiving dinners and Christmas work, associating together individuals and families of the rich and poor by these means. Baltimore, in connection with its friendly inn and provident wood-yard, also maintains two workshops where the old and feeble are provided with employment suited to their condition. In New York a committee of legal protection has been formed to protect the poor against oppression or imposture. Its mere existence has proved largely preventive. In the past year it has given counsel in four cases and active assistance in three. Attempts to impose upon respectable workingwomen were also exposed by New York and Baltimore acting in co-operation, and the offenders were brought to justice. New York publishes in its "Monthly Bulletin," a cautionary list of fraudulent societies or of individuals fraudulently soliciting aid. It also examines sensational appeals sent to newspapers, and exposes those that have no good claim upon public sympathy.

Beggars.—In view of the danger now threatening society, of a caste of confirmed paupers, the charity organization societies of the large cities are making strenuous efforts to break up the practice of street-begging, and with measurable success. The New York society, through its special agent, last year procured the arrest of 117 beggars, 115 of whom were committed, and 2 discharged with reprimand; 270 were warned, counseled, assisted, and directed. The results upon the practice of street-begging are very marked.

Central Registration.—In 1886 the co-operation of the various charity organization societies of the country was made more perfect by a system of central registration at Buffalo. This system is of the greatest benefit in tracing frauds and in diffusing intelligence. It includes, besides the registration of hundreds of thousands of investigated cases, a plan for a telegraphic code, a plan to secure uniform statistics, a plan for introducing teaching of charity-organization subjects into high-schools and colleges, and the preparation of a primer of organized charity for educational purposes.

Education.—Buffalo has for two years made charity organization a subject of study in its high-school. Johns Hopkins University has established a course of lectures on the subject, Harvard and Cornell Universities and the

Union Theological Seminary of New York have included some of the literature of charities in their courses of reading. A digest of practical suggestions for treatment of various forms of distress and misfortune has recently been prepared by the central committee of the New York society and sent to every charity organization society in the United States and Great Britain for suggestion and amendment, in the hope thus to supply the English-speaking world with "a code that shall be at least the basis of a benign, intelligent, and helpful system of charitable therapeutics." A body of legal suggestions has been prepared by lawyers of ability and published in a hand-book for friendly visitors. The district conferences are also a valuable means of practical education.

The mere existence of charity organization is an education of the public in true philanthropy. Charity without alms was a surprise. The proof that it could exist was a powerful means of educating public opinion and tends to reconcile class with class.

The constructive work of charity organization is chiefly in education of the poor. There is nothing in the system to encourage in the poor a distaste to earning a living. It continually builds up a sense of the honorable nature of labor and of the dishonor of accepting unnecessary alms. Association with the friendly visitor raises the standard of ideas of comfort and dignity, and gives new courage, hope, and strength of character, while the visitor also imparts direct instruction in thrift, neatness, and the care of children. Technical education is given by some societies. Two have kitchen-gardens, two have cooking-schools, five have sewing-schools. Other educational methods are a night-school for boys in Buffalo and a girls' club and reading-room in New Brunswick, N. J. The various provident schemes are an education in self-denial, frugality, and forethought.

Provident Schemes.—Indianapolis has a Dime Savings and Loan Association, with 166 depositors holding 456 shares of \$25 each. Newburg and Castleton (Staten Island), N. Y., and Newport, R. I., have savings societies, the latter admirably successful and peculiarly needed from the anomalous nature of social conditions there. Five cities have coal savings societies, and Philadelphia has a well-managed loan relief. The office is in the building of a manufacturer, and all appearance of charity is thus removed. Security is insisted upon, and a special feature is that, when possible, it is the personal guarantee of a friend in the borrower's own circle, who thus has a personal interest in his sobriety and industry. All legal forms are carefully insisted upon and regular payments enforced. The educational value of this system has been found very great. New York has just inaugurated with good promise a system of stamps for penny savings.

Friendly Visitors.—As a collation of the fig-

ures of the various societies shows that the ratio of cases lifted from dependence to self-support is in direct proportion to the number of friendly visitors employed, the supreme importance of this branch of the work becomes evident. The total number reported last year from 34 societies, representing 65 per cent. of the whole number, and 88 per cent. of the population in their fields of work, was 8,560, or about one for 2,292 of the estimated paupers in these fields. Of the actual cases treated, this number of visitors is as 1 to 164 families. To provide uniformly at the rate of 1 to 5 families, the rate actually existing in Boston, 108,750 would be needed, or 1 volunteer worker out of every 16 families of the 52 cities under consideration. New York has 180 volunteer visitors. Among the friendly visitors of Boston are 40 college-students.

Legislation.—Besides the regular business of investigation, registration, visiting, exposure of frauds, direction of charitable effort, promotion of co-operation, and education, much effort has been given to both preventive and constructive work in the way of procuring a better legislation. The first, and in many respects the most important law procured by charity organization was that secured in New Haven in 1880, regulating the sale and use of intoxicating liquors, which is still the best in force in the country. In 1883, through its efforts, Massachusetts passed a law for bringing children of worthless parents before the courts and giving them into proper guardianship. In 1886, charity organization in various cities memorialized Congress in favor of postal savings-banks. The memorial was unfavorably reported, but the effort is laid aside temporarily only. In 1887, Boston, after three years of continuous effort, succeeded in getting a law prohibiting begging and peddling by children. In 1886, the Committee on Mendicancy of New York procured amendments to the State penal code to include stale beer dives in the category of disorderly houses. It also, in 1887, secured legislation which passed both Houses unanimously, defining more clearly who are vagrants, lengthening the terms of commitment with a view to a more reformatory discipline, and making more futile the pretexts by which professional beggars legalize their traffic; but Gov. Hill withheld his signature. It also attempted, in connection with charity organization in other cities and with the State Charities Aid Association, to procure postal savings-banks, but without success. They secured a bill for municipal lodging-houses, but it has remained a dead letter, the Board of Estimate and Appropriation persistently refusing the \$23,000 asked for by the city. In October, 1888, a special committee of charity organization was appointed to take it up. In 1886 the Charity Organization Society of New Haven procured a local ordinance suppressing low variety theatres. In 1887 a bill was secured in Pennsylvania providing a system of way-

farers' lodges, and they are now in operation. The same year Baltimore tried to procure an amendment to the law forbidding street-begging, was unsuccessful, and is continuing the fight. New York is now attempting to secure longer sentences for drunkenness and vagrancy; and efforts are being made, and will be continued at Washington, to carry out the views of the combined societies with regard to immigration.

When charity organization does not procure legislation directly, it does it indirectly by constant agitation of certain topics, and by educating the popular mind as to the precise nature of legislation needed. In general, it may be said that the legislation most needed is that of such a character as to render criminal legislation unnecessary.

Order.—In 1881 the Executive Committee of the Boston Charity Organization Society called the attention of the police commissioners to the lack of interest in enforcing the license, screen, and Sunday laws, and the laws forbidding the selling of liquor to minors and habitual drunkards, or to be drunk on the premises. After two years of agitation, they were measurably successful.

Statistics.—Charity organization was instituted in London in 1869; in America (in Buffalo, N. Y.), in 1878. There are now 82 affiliated societies in Great Britain, 93 in Europe, Asia, Africa, and Australia, and 65 in the United States, with correspondents for co-operation in investigation or aid in 85 towns or villages, where no society exists. It is estimated that 1 in 125 of the whole population belongs to the dependent classes, is either a pauper or a criminal or dependent on them. The urban pauperism of the country is as 1 to 16; 62.5 per cent., or five eighths of the pauperism within the bounds of the thirty-four larger societies, or one sixth of the entire pauperism of the United States, has been investigated and registered.

Co-operation.—Charity organization, in the various towns and cities where it exists, has obtained the co-operation of 66 per cent. of voluntary out-door charities, of 69 per cent. of indoor institutional relief, of 80 per cent. of the boards that distribute relief from taxation, of 45 per cent. of the churches, and of 50 per cent. of private beneficence. These figures represent co-operation promised and available, rather than actually and fully used. Its benefits are to a large degree mutual.

Results.—In Elberfeld, Germany, charity organization has reduced pauperism 78 per cent. in fifteen years; in London, 30 per cent. in ten years; in Buffalo, 37 per cent. in ten years. In many cities it has entirely done away with public out-door relief. In Cincinnati there was a decrease in one year of 16 per cent. of pauperism; in the smaller towns and cities the result is more marked. In New York, in five years, 4,548 families have been made self-supporting who were previously chronic depend-

ents. The results for law and order are very evident in some of the smaller towns, notably, in Newport, R. I., and Oasleton, Staten Island. In the large towns they are not yet visible.

Conclusions.—From the tabulation of statistics collected in the thirty-two larger towns, it is conclusively shown that from 40 to 53 per cent. of all applicants for charity need employment rather than relief; that from 16 to 23 per cent. need police discipline; and that from 31 to 37 per cent., or one third of the whole number, need material assistance. In other words, two thirds of the real or simulated destitution of the country could be wiped out by a more perfect adjustment of supply and demand for labor, and by a more efficient administration of the laws. The fact that the best successes of charity organization are in the small towns, shows that the cure of pauperism is a question not of alms, nor of a redistribution of wealth, but of neighborhood.

The value of the statistics collected and tabulated, and of the conclusions drawn from them, is evident. The aid that co-operative study and experiment by so large a body of experts lend to the student of social questions, can hardly be overestimated. The financial economy of the work is excelled only by its moral economy. Edward Atkinson's estimate of the value to the community of a single man converted from pauperism to self-support, shows a gain to New York city alone of \$1,819,200 in the past year. This amount, compared with the \$30,000 that the organization cost, gives but a faint idea of the gain to society. Among its moral benefits are the uplifting of character, the inspiring of confidence between class and class, and the holding of public officials, such as boards of health and inspectors of buildings, to their duties.

Charity organization is steadily growing in favor, but is not yet sufficiently understood and trusted either by rich or by poor. An attempt made in New York in the spring of 1888 to bring it into disrepute as "a device of capital, not to save the poor, but to save itself—a class-movement, a conspiracy against the interests of labor," brought forward a large number of new adherents, but doubtless was not without its effect upon the minds of the lower classes.

Bibliography.—Chicago publishes a monthly bulletin, "The Council," a series of useful monographs upon topics connected with the work. "The Monthly Register," of Philadelphia, is a medium of communication between twenty-four of the societies. "Lend a Hand," a monthly magazine, devoted to philanthropy, gives much space to it, and publishes monthly lists of reports, essays, and books on kindred subjects. London publishes a "Charity Organization Review"; New York, a "Monthly Bulletin" for the information of members, a "Directory of Charities," a "Handbook for Visitors," and various miscellaneous papers. Baltimore and Boston publish "Directories of

Charities," and Boston, besides issuing valuable tracts, publishes a "Select List" of books and papers on charitable work, to be found in the Boston Public Library and elsewhere. All the larger towns publish annual reports. The American Social Science Association Report, No. 12, contains valuable monographs on charity organization, and there are very many scattered through various State reports, which are lost, except to limited circles. The valuable pamphlet, "Notes on the Literature of Charities," by Prof. Herbert Adams, issued by Johns Hopkins University, is the best guide to the study of this subject.

CHEMISTRY. Chemical Philosophy.—Pursuing his researches into the nature and origin of the elements, Mr. William Crookes applies the term meta-elements to designate such substances as have been revealed in his own experiments and those of Krüss and Nilson in the rare earths, the chemical differences between which are so faint as to render it doubtful whether they are to be classed as separate elements or modified forms of the same element. Among such bodies are those into which yttrium, erbium, samarium, etc., probably split up. When the only perceptible chemical difference is, say, an almost imperceptible tendency for the one body to precipitate before the other, or when the chemical differences reach the vanishing-point while well-marked physical differences still remain, the problem is an embarrassing one. Seven classes of such cases that have occurred in the author's experiments are described. If we multiply the elements in accordance with these shades of differences we are liable to come in conflict with the periodic theory, which "has received such abundant verification that we can not lightly accept any interpretation of phenomena which fails to be in accordance with it." To meet this difficulty he applies the hypothesis already suggested in his British Association address on the "Genesis of the Elements" (see "Annual Cyclopædia" for 1886), that the atoms are not necessarily all absolutely alike among themselves; but that the smallest ponderable quantity of any element "is an assemblage of ultimate atoms almost infinitely more like each other than they are like the atoms of any other approximating element"; and that the atomic weight ascribed to the substance "merely represents a mean value around which the actual weights of the individual atoms of the element range within certain limits."

A theory of the form and action of the atoms of carbon, suggested to Professors Victor Meyer and Riecke by experiments in diversion of the four valencies from their positions, supposes that the atom is a sphere surrounded by an ether-shell, and that it is itself the carrier of the specific affinity, while the surface of the ethereal envelope is the seat of the valencies. Each valency is conditioned by the existence of two opposite electrified poles, forming a system

called a di-pole. The middle point of the line joining each pair of poles remaining always in the surface of the envelope, but freely movable in it, the di-pole would be able to rotate freely around this central point. The atom being supposed to possess a greater attraction for the positive than for the negative ends of the di-poles, the positive ends would turn toward its center, while the valencies of the same atom would repel each other, and take up their positions at the corners of the tetrahedron, from which, however, they can be deflected.

The theory of valency as upheld by Helmholtz, with its classification of the elements as monads, dyads, triads, etc., according to the number of definite, or atomic charges of electricity which are associated with them, is called in question by Prof. Henry Armstrong, who advances in its place what he terms a theory of "residual affinity." He would define a molecular compound as one formed by the coalescence of two or more molecules, unattended by redistribution of the constituent radicles, and in which the integrant molecules are united by residual affinities. In other words, the unit charge must be capable in certain cases of promoting the association, not merely of two, but of at least three atoms. After explaining his theory in some of its details, with graphic illustrations, the author adds that if his contention is correct that residual affinity plays a far more important part than has hitherto been supposed, and that it must be taken into account in all discussions on valency, "it follows of necessity that our views regarding the constitution of the majority of compounds at present rest upon a most uncertain basis. . . . The properties of compounds being demonstrably dependent on the intramolecular conditions, it is difficult for a chemist to resist the feeling that the peculiarities manifested by the different elements are also very probably the outcome of differences in structure. . . . There appears to be an increasing weight of evidence to favor the assumption that the influence exercised by compounds in cases of chemical change is local in its origin; that it is exercised more by a particular constituent or constituents—in particular directions, in fact—than by the molecule as a whole."

A relation has been discovered by Dr. C. Bender to exist between certain physical constants and chemical valency. On mixing two chemically inactive salt solutions, the density, expansion, and electrical resistance of the mixture generally diverge very considerably from the arithmetical mean of those of the constituents. But Dr. Bender finds it possible to prepare "corresponding" solutions, which, on mixing, shall not exhibit such divergence, and further, the strengths of those "corresponding" solutions expressed in gramme-molecules per litre bear extremely simple relations to each other. For example, with respect to density and expansion, a solution of sodium chloride containing one gramme-molecule per litre of

water at 15° C. corresponds with a solution of potassium chloride also containing a gramme-molecule, or a barium-chloride solution containing half a gramme-molecule, barium being divalent; corresponding with these are also a solution of ammonium chloride containing $\frac{1}{2}$ gramme-molecule, and a lithium-chloride solution in which $\frac{1}{2}$ gramme-molecule is dissolved in a litre of water. With respect to electrical conductivity, the following also correspond: Solutions of NaCl, LiCl, and $\frac{1}{2}$ (BaCl₂), each containing n gramme-molecules; and of KCl and NH₄Cl, each containing $\frac{1}{2} n$ gramme-molecules per litre.

Chemical Physics.—A close relation has been found by Carnelly and Thomson to exist between the solubility and the fusibility of isomeric carbon compounds. Pictet had observed that the lower the melting-point of a solid, the longer are the oscillations of its molecules, so that the product of the melting-point, measured from the absolute zero, by the oscillation, is constant. Hence, the author's reason, of two isomers, the one with the lower melting-point will, at any temperature below this point, have its molecules moving with oscillations of greater amplitude than the one with the higher melting-point; and being in less stable condition, they will be more readily separated from their fellows. Solution also being a sort of loosening process to the molecules, should follow a similar rule. Hence, it is concluded, the order of fusibility is the order of solubility; and in any series of isomeric acids, not only is the order of solubility of the acids themselves the same as the order of fusibility, but the same order of solubility extends to all the salts of these several acids. The authors find that for any series of isomeric compounds the order of solubility is the same whatever be the nature of the solvent; and that the ratio of the solubilities of the two isomerides in any given solvent is very nearly constant, and is therefore independent of the nature of the solvent.

In his earlier experiments on the union of bodies by pressure (see "Annual Cyclopædia" for 1883), Spring made use of simple substances; in his later work compound bodies are used. Mixtures of dry, pure, precipitated barium sulphate and sodium carbonate were subjected to the influence of a pressure of six thousand atmospheres under various conditions of temperature and duration of contact. It was found that the amount of barium carbonate produced by this action increases with the number of times the mixture is compressed. After a single compression the amount was about one per cent. If the solid block produced by this compression is ground into fine bits and again subjected to the same pressure, and the process repeated a second time, about five per cent. of the barium carbonate results. A sixth compression yielded nine per cent. of the product. If the little blocks produced by one, three, and six compressions are left to themselves for some days

and then examined, it is found that, up to a certain limit, reached in about fourteen days, the amount of barium carbonate formed increases with the length of time during which the blocks have been exposed. When the reactions are reversed—that is, when sodium sulphate and barium carbonate are mixed and subjected to pressure, a part of the barium carbonate, increasing with repetitions of the pressure, passes over into the sulphate. The author regards it as established that matter assumes under pressure a condition relative to the volume it is obliged to occupy; and that for the solid state, as for the gaseous, there is a critical temperature, above or below which changes by simple pressure are no longer possible.

Heating a platinum wire nearly to melting in an atmosphere of chlorine, W. R. Hodgkinson observed that the walls of the glass vessel were covered with a yellow deposit that proved to be platinum chloride, while the less heated part of the wire was incrustated with fine long crystals of platinum, and a lambent flame was seen playing about the wire. With bromine instead of chlorine, less of the salt was formed, but the flame was more pronounced; with chloride of bromine, both phenomena were intensified; with iodine the action was weak; but with chlorine and iodine it was very vigorous. With phosphoric chloride, the phosphorus united with the platinum and melted it; and with silicon fluoride the wire was covered with crystals supposed to be of silicon.

The cause of the ejection of solid particles from platinum and palladium when glowing under the influence of the electric current, with formation of incrustations upon the glass tube surrounding the wire, has been investigated by Dr. Alfred Berliner. It proves to be produced by the escape of gases occluded within the metal, carrying off particles of the substance with them.

The vapor-density of sulphur has been redetermined by Dr. Biltz. Previous experiments made at a limited range of temperature not far from its boiling-point, indicated a composition of this element of six atoms to the molecule. The later experiments by Dr. Church, now confirmed by Dr. Biltz, made at higher temperatures and showing a regular decrease of vapor-density as the temperature rises, give the normal constitution of two atoms to the molecule, which is reached at 860° C., as alone standing the test of intervals of temperature.

Experiments upon the vapor-density of ferrio chloride by Drs. Gränewald and Victor Meyer for the purpose of determining its molecular formula, give as a result FeCl₃ as the true symbol, instead of Fe₂Cl₃. The result brings the formula of this salt into harmony with those of the corresponding salts of aluminum, AlCl₃, and Indium, InCl₃. It follows that the former view as to the tetrad nature of iron must be laid aside.

Thomson and Threlfal have found that on

passing electric sparks through nitrogen contained in a tube at a pressure of less than 0.8 of an inch of mercury, a very slow, permanent diminution of the volume of the nitrogen occurs. If the tube is heated at 100° C. for several hours, the original volume is regained.

New Substances.—A curious compound of arsenious iodide with the hexiodide of sulphur has been obtained by Dr. Schneider, of Berlin. It appears in a dark-gray mass of homogeneous hard and brittle crystals, which yield a reddish-brown powder on pulverization. They can not be preserved in the air, losing all their iodine in twenty-four hours, but can be kept in sealed tubes for any length of time. The compound is of peculiar interest on account of its bearing upon the theory of affinities. The hexiodide of sulphur affords the only known instance in which the supposed six combining bonds or affinities of sulphur are satisfied by monad atoms; and the natural supposition that it would be eminently "saturated" is overthrown by this revelation of its capacity to enter into new compounds.

The compound $\text{KF} \cdot 3\text{HF}$ has been prepared by M. Moissen by combining potassium fluoride and hydrofluoric acid in suitable proportions, avoiding any sudden rise of temperature. On cooling the solution to -23° C., crystals separated. The crystals are extremely deliquescent, are decomposed by water into the free acid and potassium fluoride, and dissolve in water with production of the most intense cold. If they are suddenly heated with crystalline silicon, the mass becomes incandescent, and a violent disengagement of silicon tetrafluoride gas occurs.

While experimenting on the production of gelatinous gun-cotton, F. Nettlewood obtained, by the nitration of alginic acid, a body sufficiently elastic on compression but not explosive, which gave a brown color when dissolved in water in alkaline solution. The original color of the nitro-alginic acid was bright yellow, and it was insoluble in water. Unmordanted cotton dyed a fine Bismarck-brown color, which was fast to soap, more so than many aniline colors, and equaling chrysoidine. Mordanting with alumina or tartar-emetic did not increase the fastness or the depth of the color. The depth of shade was considerable, and could be worked to a great intensity. In an acid solution the dye failed to attach itself to the fiber, ammonia being the best alkali.

A large number of new aromatic fluorine substitution products have been prepared by Drs. Wallech and Hensler, the properties of which point to some interesting conclusions regarding the physical nature of fluorine itself. It is found that in all cases the specific gravity of a compound is raised by the introduction of fluorine instead of hydrogen, while on the other hand the substitution of fluorine is found to have a remarkably small effect in raising the boiling-point. A still more interesting fact is that the difference between the boiling-points of corresponding iodine and bromine substitu-

tion products, and again between those of bromine and chlorine is smaller than that between the substitution derivatives of chlorine and fluorine. While this difference of boiling-points between corresponding bromides and chlorides amounts to from 20° to 23° C., that between chlorides and fluorides approaches 40° C. This fact, coupled with the small influence which the substitution of fluorine exerts upon the boiling-point, indicates the probability that the boiling-point of free fluorine itself lies very much below that of chlorine (-33.5° C.), and that fluorine much more nearly approaches the volatility of hydrogen. Indeed, it appears likely that fluorine is one of the so-called permanent gases, and might form a worthy object for the attention of those who have been successful in forcing the other "permanent" gases to reveal their boiling-points. Under all circumstances fluorine attaches itself to carbon with far greater tenacity than any of the other halogens.

Several compounds of silicon tetrafluoride with organic derivatives of ammonia, similar to the body $2\text{N}, \text{H}_2\text{SiF}_6$, have been formed by Messrs. Comey and Loring Jackson, of Harvard. One of two compounds with aniline formed by them is remarkable for being insoluble in the usual organic solvents, only alcohol slowly acting upon it with decomposition. Brought in contact with water it is at once decomposed, with deposition of silicic acid; the solution, on evaporation, yields pearly tabular crystals of aniline fluosilicate, aniline fluoride remaining dissolved. Another aniline compound was formed as a white powder, decomposing when warm or when treated with water, and even spontaneously on keeping.

A new base, theophylline, has been discovered by Dr. Kossel in tea, which, while an isomer of theobromine, differs very materially from it in physical and certain chemical properties. Theophylline forms a well-crystallized series of salts with the mineral acids, and with platinum, gold, and mercury chlorides, and, like theobromine, yields with silver nitrate a silver substitution compound, which is readily soluble in nitric acid.

A new base and its series of salts, belonging to the group known as "platinum bases," have been obtained by Dr. Heinrich Alexander, of Königsberg. The base has the composition $\text{Pt}(\text{OH})_2 \cdot 4\text{NH}_3\text{O}$, and may be considered as the hydroxylamine-platinum compound corresponding to the free base of the green salt of Magnus. The chloride of the series had been already prepared by Lossen. The free base is precipitated from this salt on the addition of stronger bases, and is perfectly stable in the air, extremely insoluble in water and alcohol, and behaves like a true metallic hydroxide. The sulphate, phosphate, oxelate, and two interesting isomeric salts, have been obtained.

A new series of isomorphous double chlorides of the metals of the iron and alkali groups

have been prepared by Dr. Neumann. The general formula of the system is $4RCl \cdot M_2O_3 + 2H_2O$, where R may represent any member of the group of alkali metals, and M either iron, chromium, or aluminum. Magnesium and beryllium are also included in the series, $2MgCl_2$ or $2BeCl_2$ replacing $4RCl$. They all crystallize in forms belonging most probably to the regular system, generally in octahedrons or rhombic dodecahedrons, with the exhibition of characteristic and brilliant colors.

Pure trichloride of nitrogen has been prepared by Dr. Gattermann, of Göttingen. As usually made, the substance is rather a varying mixture of several chlorides than homogeneous. The author's process consisted in washing the crude product, which was as richly chlorinated as possible, with water till all the sal-ammoniac was removed, draining it, and leading it over a rapid stream of chlorine. The success of the operations, which were performed without accident, was ascribed to the fact that they were performed on dull wintry days, when the sun's actinism was very low. But at last, in about the thirtieth preparation, the oil exploded with its usual detonation. At the same moment, Dr. Gattermann noticed that the sun had broken through the clouds, and was shining upon his apparatus. The apparently spontaneous explosions seem, therefore, to be due to the violent dissociation of the chloride by the wave-motion of light. It was found that the burning of a piece of magnesium ribbon near the oil was as effective as sunlight in producing the explosion. The temperature of dissociation of the compound was determined to be about $95^\circ C$.

The allotropic amorphous modification of antimony, signalized by M. Gore, and resulting from the decomposition of antimony chloride, bromide, or iodide by the battery, has been obtained by P. Hérard. The author heated antimony to dull redness in a current of nitrogen, and observed a development of grayish vapors which condensed in a gray powder on the sides of the glass tube in which the apparatus terminates. This powder consists of minute globules united like the amorphous arsenic of Bettendorff; it contains 98.7 per cent. of antimony. Its specific gravity at 0° is 6.22, while that of crystalline antimony varies, according to Isidore Pierre, from 6.725 to 6.737. Amorphous antimony melts at $614^\circ C$., while crystalline antimony melts at $440^\circ C$.

Three new chlorine compounds of titanium have been obtained by Drs. Koenig and Van der Pfordten, of Munich. They may be considered as chlorine derivatives of titanous acid, $Ti(OH)_3$, and form the only complete series of such compounds with which we are as yet acquainted in inorganic chemistry.

E. A. Schneider has obtained a compound of manganese sesquioxide with cupric oxide, and has thereby formed a new illustration of the properties which indicate an analogy on the one hand between the manganese oxide and

the sesquioxides of iron, chromium, and aluminum, and on the other hand, between the oxides of copper, silver, and mercury, and those of the alkali metals. The experiment also confirms the arrangement in Mendelejeff's classification of the elements by which manganese occupies the place between chromium and iron.

Four new zinc titanates have been obtained by Lucien Levy by melting titanous acid with mixtures of zinc and potassium sulphates. At dull redness the product is always the sesquibasic titanate. At bright redness it is one of the three others, according to the proportion of flux.

Three new sulpho-chlorides of mercury have been isolated by Drs. Poleck and Goercki, of Breslau. The peculiar changes of color which occur when a solution of mercuric chloride is precipitated by sulphureted hydrogen gas—from white to yellow, orange, brownish red, and black, are produced by different degrees of combination of the chloride and sulphur, forming different substances, of which the first had been already shown by Rose to be $2HgS \cdot HgCl_2$. The present authors have, by careful manipulation, succeeded in securing other compounds— $3HgS \cdot HgCl_2$, $4HgS \cdot HgCl_2$, and $5HgS \cdot HgCl_2$, while the final product is the sulphide of mercury, HgS , itself. In each case the filtrate was found to be free from quicksilver and chlorine, proving that the extra molecule of the chloride had in each case combined. These sulpho-chlorides are very stable, perfectly insoluble in water, insoluble in hydrochloric and nitric acids, but soluble in *aqua regia*.

A tetrasulphide of benzene has been prepared pure, by Dr. Otto, of Brunswick. It appears when phenyl-disulphide, prepared by passing sulphureted hydrogen gas through an alcoholic solution of benzene-sulphuric acid, is allowed to stand, when the liquid separates into monoclinic crystals of sulphur and a yellow oil. The yellow oil consists of a phenyl-tetrasulphide $(C_6H_5)_4S_4$, which at the ordinary temperature is a very viscid, heavy, highly refracting oil with an unpleasant odor. It is a comparatively stable compound, but on warming with colorless ammonium sulphide is reduced to disulphide. According to Klason, phenyl-tetrasulphide is also the product of the action of dichloride of sulphur, S_2Cl_2 , upon thiophenol, C_6H_5SH , the mercaptan of the benzene series, and Otto shows that this is really the case.

A new gas, of the composition PSF_3 , and possessing some remarkable properties, has been discovered by Prof. Thorpe and Mr. J. W. Rodger. It is called thiophosphoryl fluoride. Various methods of preparing it are given. It is spontaneously inflammable, and burns with a greenish-yellow flame tipped at the apex with blue. It is readily decomposed by the electric spark with deposition of sulphur; is slowly dissolved by water; and is somewhat soluble

in ether, but not in alcohol and benzine. It can be reduced to a liquid by means of Cailletet's apparatus.

To the gaseous hydrates already known, M. Villard has added analogous hydrates of methane, ethane, ethylene, acetylene, and protoxide of nitrogen. They are generally less soluble and less easily liquefied than those previously obtained, and are decomposable at the respective temperatures of 21.5° , 12° , 18.5° , 14° , and 12° , all O. It is shown in the case of methane and ethylene that a gas may form a hydrate above its critical temperature of liquefaction, and that these two gases have a critical temperature of decomposition considerably higher than the others.

The gas, allene, the isomer of allylene, the second member of the acetylene series of hydrocarbons, has been obtained pure and examined by MM. Gustavson and Demjanoff, of Moscow. It is very different in some of its properties from ordinary allylene, yet is represented by the same empirical formula, C_3H_4 . It is obtained from the action of zinc-dust upon an alcoholic solution of dibrom-propylene. It is colorless, has a peculiar smell, and burns with a smoky flame. Unlike allylene, it yields no precipitate with ammoniacal copper or silver solutions, but gives white precipitates with aqueous solutions of mercury salts.

A sodium salt of zincic acid has been isolated in the crystalline state by M. Oomey, and Loring Jackson, of Harvard University. On shaking with alcohol a concentrated solution of zinc or zinc oxide in soda, the mixture separated on standing into two layers, a heavier aqueous and a lighter alcoholic layer. The heavier layer, being washed with alcohol solidified with a mass of white crystals, while the alcohol washings, on standing, deposited long white crystals, which when purified and analyzed, gave their composition as $2 NaHZnO_2 + 7H_2O$, or $2Zn(OH)(ONa) + 7H_2O$. Hence this new salt may be regarded as hydrated sodium zincate. It is soluble in water and alcohol holding soda in solution, but is decomposed both by pure water and alcohol.

Some new salts of camphoric acid have been described by J. H. Manning and G. W. Edwards. Manning found that manganese camphorate, $MnO_2 \cdot H_2O$, was precipitated from a mixture of potassium camphorate and manganese sulphate heated on the water-bath. It is white. Chromium camphorate, $Cr_2(O_2 \cdot H_2O)_3$, was obtained as a bluish-green precipitate from a mixture of potassium camphorate and solution of chromium sulphate. Ferric camphorate, probably a subcamphorate, resulted from the precipitation of a strong solution of ferric chloride with potassium camphorate. It had a yellowish color and was insoluble in water, and gave on drying at 100° a buff-yellow powder. A white heavy precipitate of mercuric camphorate, $Hg, C_{10}H_{16}O_4$, was formed on adding potassium camphorate to a concentrated solution of mercuric chloride.

A new tetrahydric alcohol, $C_{10}H_{22}O_4$, belonging to the series $C_nH_{2n+2}O_n$, has been synthetically prepared in the laboratory of M. Friedel, by M. Combes. It is the first tetrahydric alcohol which has been prepared by direct synthesis, and is one of the results of the application by M. Combes of the aluminum chloride reaction of MM. Friedel and Crafts to the fatty series.

A substance having all the appearance of silk is prepared by M. de Chardonnet by the addition to an etherized solution of nitrated cellulose of a solution of perchloride of tin, and to this mixture a little of a solution of tannic acid in alcohol. A fine stream of this liquid, under water acidulated with nitric acid, becomes consistent, and may be drawn out, dried, and wound. It is gray or black in aspect, supple, transparent, cylindrical, or flattened, of silky aspect and touch, and breaks under a weight of twenty-five kilogrammes the square millimetre. The fiber burns without the flame being propagated; is unattackable by acids and alkalis of mean concentration, by hot or cold water, alcohol, or ether, but is dissolved in etherized alcohol and acetic ether.

Saccharine is a coal-tar product which was discovered in 1879 by Ira Remsen and O. Fahlberg, and is distinguished by the intensity of its sweetness, which is rated at two hundred and fifty times that of cane-sugar. It is prepared by a long and complicated process, and has a composition which is represented by the formula $C_6H_8SO_2$. It is a white powder, or appears crystallized in short, thick prisms, has an odor of bitter almonds, is hardly soluble in cold water, more so in boiling water, and quite soluble in alcohol and ether, and has an acid reaction. When mixed in solutions or used as a sweetening, it is hardly distinguishable to ordinary human tastes from sugar; but it has been observed that insects are not attracted to it, and some insects avoid it. It is a strong antiseptic, and does not perceptibly interfere with digestive action, except in an acid medium, when its antiseptic power is greatly weakened, and digestion is retarded. It is not eliminated by the salivary or the mammary glands, but is carried away in the urine. It has been used to some extent as an emollient in diabetes and intestinal affections, and to prevent the absorption of the ptomaines of the blood, but its value for these purposes has not been settled. No use has been found for it in ordinary economy, except to assist in adulterations.

On completing the filtration of a solution of pig-iron in hydrochloric acid, P. W. Shimer observed a minute residue in the beaker. It was a gritty substance, with a steel-gray color and metallic luster. Under the microscope it appeared to be made up of opaque cubical crystals and fragments of the same color and luster. The material had a specific gravity of 5.10, and was insoluble in hydrochloric, but readily soluble in nitric acid. Upon analysis it was

found to consist of about 88 per cent. of a titanium carbide, in which titanium and carbon are present in very nearly the exact proportion of their atomic weights.

The only compounds formed by the union of metallic bases with benzine-sulphonic acid, prepared and analyzed previous to the experiments of T. H. Norton and T. W. Schmidt, were the barium, copper, zinc, and silver salts. The authors have increased this number by the addition of the cadmium, manganese, nickel, cobalt, and mercurous salts.

New Processes.—A new method of preparing silicon, and recent researches respecting its allotropic modifications are reported by H. N. Warren. The element is prepared from bars of silicon eisen, by dissolving away the iron connected with the positive wire in dilute sulphuric acid, and treating the solid residue, heated to redness, with a stream of carbonic anhydride, and subsequently heating in contact with zinc. On dissolving the zinc away, the silicon separated in a crystalline condition. A further quantity was simultaneously converted into graphitoid silicon by fusing at a full white heat in contact with aluminum and parting by means of acid. The three modifications of silicon may be converted by suitable means from the crystalline to the graphitoid, and even to the amorphous, or *vice versa*.

The following means for determining the quantity of morphine in opium has been awarded by the Austrian Pharmaceutical Society the prize offered for a simple method sufficiently accurate to meet the practical need: Five grammes of the opium powder are macerated in a small flask, with 75cc. of lime-water, for twelve hours, with frequent shaking. This is then filtered through a plaited filter. To 60cc. of the filtrate, corresponding to 4 grammes of opium, which is brought into a weighed flask of such a size as to be nearly filled by the ether and ammonia, there are added 15cc. of ether and 4cc. of normal ammonia. The flask is then well corked, and the contents are mixed by gentle agitation. The flask is then set aside for from six to eight hours, the temperature being kept at from 10° C. to 15° C. At the end of that time the ethereal layer is removed, 5cc. of fresh ether are added, and the flask is gently shaken. The ether is again removed, and finally the crystals of morphine, which have separated, are collected on a small plaited filter. The crystals which remain in the flask are washed with 5cc. of distilled water. This wash-water is brought on the filter, and finally the flask and also the filter and its contents are dried at 100° C. The crystals on the filter are transferred to the flask, and this is then dried until a constant weight is obtained. The morphine thus produced is pure, and dissolves completely, though slowly, in 100 parts of saturated lime-water. The principles of treatment are the same for opium extract and opium tincture.

.. A method for detecting by the magnet adul-

terations of nickel and some other metals has been described by T. B. Warren. Two samples of nickel tubes having been carelessly mixed and the magnet applied to them, they were found to be unequally attracted by the magnet, and were finally re-sorted by this test and re-separated into the original lots. Differences in the appearances of the two lots could be detected only on a close examination. Portions of the metal were alloyed with tin, arsenic, and antimony separately, and this had a decided effect on their magnetic polarity. Cobalt is similarly affected when alloyed with paramagnetic metals.

A process for the determination of tannin by means of diluted lead acetate, employed by M. Villon, depends upon the fact that that salt precipitates tannin and not gallic acid and its allies. Tannin liquors and lead liquors are prepared (the latter containing a proportion of sodium acetate with the lead acetate); measured portions of them are left in contact for five minutes and then filtered; and the specific gravities of the lead acetate, the tannin liquor, and the filtered mixture, are severally taken, all at the same temperature; and from these the proportion of tannin is calculated.

A method for extracting the alkaloids of cinchona-bark with cold oil has been used in the Government factory at Sikkim with most satisfactory results. By it all the quinine is separated as against only about half by the process formerly used, and the quality of the product is unimpaired.

A basic process for iron described by W. Hutchinson as used in South Staffordshire, differs from the ordinary basic process in that the converting is conducted in two stages. 1, desilicouizing the metal in an acid-lined converter; and, 2, dephosphorizing in a converter with a basic lining.

A method is described by F. A. Gooch for the separation of sodium and potassium from lithium by the action of amyl alcohol on the chlorides. It is also applied to the separation of the same metals from magnesium and calcium.

In experiments made by W. H. Greene to ascertain whether mercury can be purified by distillation, or whether foreign metals are vaporized with it, twelve distillations were made of mercury which had been mixed with bismuth, lead, tin, sodium, and copper. The retorts contained no residue of mercury and the distilled mercury was pure.

Hasebroek proposes as a delicate test for bismuth the addition of hydrogen peroxide made alkaline with potassium or sodium hydrate to bismuth subnitrate, which, on heating, from white becomes brownish yellow with the evolution of oxygen.

The investigations of Christopher Rawson of the various methods of estimating indigotin show that indigo, when finely pulverized, is completely dissolved by sulphuric acid, at from 90° to 95° C., in one hour. The permanga-

nate method affords a quick and ready means for the approximate valuation of indigoes, but the results obtained are sometimes too high. The method of precipitation with sodium chloride and titration with potassium permanganate gives results which, for all practical purposes, are trustworthy.

The accuracy of the soda-lime process for determining nitrogen having been questioned, W. O. Atwater and C. D. Woods have given attention to the methods of manipulation and the sources of error and ways of avoiding them, and have been convinced that when rightly managed it gives excellent results. At the same time they decline to say that they regard the soda-lime method as entirely reliable, even for protein compounds, unless all needed precautions are observed.

To detect and measure magnetic susceptibility in substances which show no evidence of magnetism under the usual processes, Mr. T. B. Warren places a weight of the substance experimented upon in the pan of a chemical balance which is adjusted to the magnetic meridian; equilibrium having been made, a magnet is placed directly under the scale-pan, when, if the substance is paramagnetic or positive, the pan will be drawn down. The weights that have to be added to restore equilibrium give the measure of the susceptibility of the substance in hand. Diamagnetic or negative substances are also attracted under the same condition, instead of being repelled, as might be supposed; and the author infers from this that magnetic repulsion, in a positive sense, does not exist. To measure magnetic permeability, a plate of the metal or stratum of the liquid is inserted between the magnet and some iron-filings. When the plate is removed, the magnet is attracted to within a fixed distance of the filings, and the weight required to produce equilibrium is noted, the plate is then inserted, and the diminished attraction is again noted. The difference in weight is due to the arrest of magnetic influence by the interposed layer.

Sulphuric acid and naphthalamine hydrochloride have been found by C. E. Howard to be most delicate and satisfactory reagents for detecting the presence of nitrogenous and chloride impurities in drinking-water. Water but slightly tainted with nitrous acid only gives a very faint pink on application of these tests. In proportion as the contamination is greater, the coloration is more intense, until a deep carmine is produced. The reagents for chlorides, the presence of considerable quantities of which may indicate contamination by animal excreta, are nitric acid and silver nitrate. They produce in water containing chlorides a white precipitate of silver chloride, the exhibition of which rises from a mere opalescence when the quantity of chloride is slight to a distinct deposit when the contamination is considerable.

Chemistry of the Arts.—W. N. Hartley has shown that light may effect changes in organic

coloring substances in other ways than by promoting oxidation or reduction, thus: The color of an organic substance is an effect of its highly complex structure, notwithstanding the fact that its composition may be simple enough. It may consist, for instance, of but three or four elements—carbon, hydrogen, and oxygen, with, perhaps, nitrogen—but the number of atoms necessary to produce the smallest particle or molecule of color is large; and every color depends upon the way in which the atoms are arranged in the molecule. The shifting of a single atom will cause a brilliant color to become colorless. The effect of light on such substances is variable; sometimes the change induced is oxidation; it is sometimes a molecular change, or the rearrangement of the atoms in the molecule. Light may also be capable of resolving a complex substance into two or more simpler substances. The color of a substance depends upon the rate of vibration of its molecules. The more brilliant the light the more ample are the vibrations. It is easy, then, to understand how a light of great brilliancy may throw a colored molecule into such a state of intense vibration that the molecule will fall to pieces. The complex and unstable compound is resolved into two or more simple and colorless bodies. Unstable colors are also liable to be changed by oxygen, which is never excluded from framed pictures; moisture, which is used in the mounting of pictures, and is in the air; and acidity, which exists to a greater or less extent in all towns where coal is burned, and which is sometimes a property of the paper on which drawings are made. All preparations of lead are sensitive to impurities of the air, and should never be used in works of art; and of mercury, only pure cinnabar or vermillion. Acidity may be partly remedied by washing the paper in a slightly alkaline solution, or by using weak borax-water in applying the pigments. Of the various colors, the yellows and crimson are most affected by sunlight, and blue and gray tints by an impure atmosphere. The difference in the effect of direct sunlight and diffused daylight upon colors is very great. In the latter the prevailing rays are the yellow ones, while the violet and ultra-violet rays, which are so active in direct sunlight, are absent. Diffused light sufficient for the exhibition of pictures is forty times weaker than average direct sunlight, or four hundred times weaker than that of summer.

In a paper read at the British Association on "The Action of Light on Water-colors," Dr. Arthur Richardson named cadmium yellow, cadmium orange, king's yellow, and indigo, as colors which bleach by oxidation under the combined influence of light, air, and moisture, but are permanent in an atmosphere of carbon dioxide or in dry air. A second group of colors on which light exerts a reducing action, which is independent of air, and in some cases takes place in the absence of moisture, includes Prussian blue, vermillion, lakes,

gamboge, etc. Prussian blue fades in moist air; much more rapidly in an atmosphere of carbonic dioxide; but is permanent in dry air. Mixed with cadmium yellow, Prussian blue gave a green which was very sensitive to light if moisture was present, but was permanent in dry air. Vermillion was shown to fade in dry and moist air, also in an inert atmosphere like carbon dioxide. With cadmium yellow an oxide was formed which blackened in moist air in a few hours, though in dry air light was without action on it. The author condemns as unsafe those pigments which fade in dry air, and shows that the greater number of paints are stable in sunlight, provided moisture is absent.

When petroleum is stored in lead-lined tanks, the lead is rapidly corroded, with the formation of a heavy, brownish-colored powder. This powder has been found to consist of a carbonate and hydrated oxide of lead and a small quantity of valerate of lead; the brownish color is due to organic matter. The hypothesis that the white lead, of which the powder practically consists, and a paraffin, is formed by the action of an oxidizing agent and a small quantity of valeric acid present in the petroleum on the lead, is supported by experiments made by William Fox.

H. Le Chatelier has found that hydrated cements treated with a large excess of water give up not only the lime present as hydrate, but also, in time and after treatment with fresh quantities of water, they surrender nearly all the lime in combination. Slow-setting cements contain much calcium hydrate; quick-setting cements, very little.

Analytical Chemistry.—In the analysis of milk as recommended by the Association of Official Agricultural Chemists, the butter is estimated by drying on the water-bath for thirty minutes, or by drying with powdered asbestos for two hours at 100° C. For casein, the milk is digested with H_2SO_4 , or the dried residue is rubbed up and transferred to the soda-lime combustion tube, or is transferred to a digestion flask, and the casein estimated by the method of Kjeldahl. For the estimation of the fat, a strip of blotting or filtering paper is saturated with a measured quantity of milk, and dried, after which the fat is extracted from it; or the milk is dehydrated by means of anhydrous sulphate of copper; the fat is extracted by means of the low-boiling products of petroleum; the butter is saponified with solution of potassium hydroxide in alcohol, and the excess of the alkali is determined by means of a solution of hydrochloric acid. In Babcock's method for estimating water in fat, the milk is placed in ignited asbestos, and subjected, at 100° C., to a slow current of dry air till the water is expelled. The tube containing the solids from this operation is placed in an extraction apparatus, and exhausted in the usual way. In Prof. Macfarlane's method the milk is absorbed in asbestos fiber in a tube,

which is then exposed, to dry it, for ten or twelve hours at a temperature of 90° C. The tube is then exhausted with petroleum ether, dried, cooled, and weighed. The loss represents the butter fat. For sugar, the milk, its specific gravity having been determined, is treated with mercuric nitrate or mercuric iodide solution for precipitation of albumen, shaken, filtered, and subjected to polariscopic examination. For the estimation of ash, the milk, treated with nitric acid, is dried and burned at a low red heat till the ash is free from carbon.

In the analysis of butter, a portion of the sample, taken from the inside of the mass, is placed on a slide, treated with a drop of pure sweet-oil, and examined with a microscope and with polarized light and the selenite plate. Pure butter will show neither crystals nor a part-colored field with selenite, while other fats, melted and cooled and mixed with butter, will usually present crystals and variegated colors. The specific gravity and the melting-point are determined with apparatus prepared for that purpose. Volatile and soluble acids are estimated by processes requiring considerable manipulation. The amount of water is ascertained by heating at 105° C. for two hours in a flat-bottomed platinum dish full of sand. Salt is volumetrically ascertained by adding hot water, waiting till the melted fat has all collected on the top, and running the water, without any of the fat, into an Erlenmeyer flask. The salt is also determined in the filtrate by means of solution of silver nitrate. The methods of estimating curd depend on the principle of drying a weighed portion and extracting the fat with ether or petroleum. The residual mass is then weighed, and the curd determined by loss or ignition. In Babcock's method for the determination of casein, dried butter is treated with light petroleum till all fat is removed. The residue is then ignited with soda-lime or treated by the Kjeldahl method.

For the determination of traces of arsenic in tissues, yarns, and paper-hangings, R. Fresenius and E. Hintz digest the chopped tissue with hydrochloric acid for one hour; add solution of ferrous chloride, and heat till the excess of hydrochloric acid has passed off, and then boil till the distillation is stopped by frothing. More than two thirds of the liquid in the retort could generally be distilled over. A second distillation with hydrochloric acid is effected, and the sulphureted hydrogen treatment is applied. After elimination of organic matter, the precipitate is filtered, treated with bromo-hydrochloric acid and ferrous chloride, and distilled. Treatment with sulphureted hydrogen gives arsenic trisulphide.

The state of combination in which quicksilver is dissolved in natural waters has been studied by G. F. Becker in the course of his investigations of the quicksilver deposits of the Pacific slope. Pyrite or marcasite almost in-

riably accompanies cinnabar; gold is associated with it in a considerable number of cases; copper sulphides or sulpho-salts not infrequently; and sulphides of arsenic and antimony and zinc-blende sometimes. The waters of Steamboat Springs are now depositing gold, probably in the metallic state; sulphides of arsenic, antimony, and mercury; sulphides or sulpho-salts of silver, lead, copper, and zinc; iron oxide and possibly iron sulphides; manganese, nickel, and cobalt compounds, with a variety of earthy minerals. The sulphides most abundant in the deposits are found in solution in the water itself, while the other metallic compounds occur in deposits from springs now active or which have been active within a few years. These springs are thus adding to the ore-deposit of the locality, which has been worked for quicksilver in former years. There is reason to suppose that deposition is also in progress at Sulphur Springs. Experiments were made to determine the conditions of solubility and of precipitation of quicksilver and the other metallic constituents of the deposits in the various earthy salts or mixtures of them, held in the waters. They showed that there is a series of compounds of mercury of the form HgSnNaS , one or other of which is soluble in aqueous solutions of caustic soda, sodic sulphhydrate, or sodic sulphide, and apparently also in pure water, at various temperatures. These solutions subsist, to a greater or less extent, in the presence of sodic carbonates, borates, and chlorides. There is strong evidence that the waters of Steamboat Springs contain mercury in the same form, if indeed they do not still carry it in solution. Bisulphide of iron, gold, and zinc-blende form double sulphides with sodium, which appear to be analogous with that of mercury. Copper gives a double sulphide, but combines more readily with sodic sulphhydrate than with the simple sulphide. All of the soluble sulpho-salts may exist in the presence of sodic carbonates. Mercuric sulphide is readily precipitated from these solutions, by cooling, by dilution, and by other conditions that may be brought about among the substances existing in the solutions.

In examining olive-oil for mixture of lard oil, Mr. T. B. Warren confirms the presence of poppy-oil by passing ozone into the mixture, when a black product will be obtained by S.O_2 , and the viscosity will be increased. The lard-oil may be removed by boiling the coagulum in a moderately strong alkaline solution. The remaining mass is washed and treated for the estimation of the iodine absorptions, when, knowing the iodine absorption of the mixture and the proportion of it due to the recovered lard-oil, we have the difference corresponding to the olive and poppy oils. If we know that two oils only are present, and we know the iodine absorption of each, we have no difficulty in fixing on the quantities of each necessary to correspond with the determination.

The composition of the persulphide of hydrogen has been determined by Dr. Rebs, of Jena, to be H_2S_8 . It is a bright-yellow, mobile, transparent oil, possessing an odor peculiar to itself. When dry it may be preserved in a closed tube without decomposition, but in contact with water it breaks up rapidly, with evolution of sulphureted hydrogen and separation of sulphur.

A new method of testing alcoholic liquors, discovered by Prof. Schwartz, consists in determining the specific gravity and the index of refraction of the substance under examination.

Mr. Thomas Turner has experimented upon the value of the sulphuric-acid method for estimating silicon in iron and steel, and has compared it with the *aqua-regia* method. His conclusions are, that with cast-irons of specially good quality the silicon can be correctly estimated by evaporation with dilute sulphuric acid; with phosphoric irons the residue obtained, though white, is often impure, and should be further treated in order to obtain accurate results; with phosphoric irons containing titanium, the silica is contaminated with iron, with titanio oxide, and phosphoric acid. The residue may be very nearly white and still contain 20 per cent. of substances other than silica; on treatment with *aqua regia*, the color of the residue is usually an indication of its purity.

Chemical Synthesis.—Dr. E. H. Keiser has effected a synthesis of water, in which a known weight of oxygen in the form of copper oxide has been made to combine with an actually weighed quantity of hydrogen. The weighing of the hydrogen was accurately effected by causing it to be occluded in palladium, whereby a compound was formed which is stable at ordinary temperatures, but gives out its hydrogen when heated. A new determination of the atomic weight of oxygen by this process gives it as slightly lower than 15.96 and more nearly 15.87.

Drs. Emil Fischer and Tafel have succeeded in artificially preparing glucose directly from glycerin. The glycerin was oxidized by means of soda and bromine to aldehyde, and this was subjected to a subsequent condensation by means of alkalies. The synthesis had been previously effected by decomposition of acrolein dibromide with baryta water, but the new method is a far readier one.

Bernthsen and Semper have produced by artificial synthesis the substance nucine, or juglon, which appears in the form of needle-shaped crystals upon the outer coatings of walnuts, and which has been found in the expressed juice of the same.

The synthesis of crystalline dicalcium arseniate, or pharmacolite, has been effected by M. Dufet through the slow interdiffusion of solutions of nitrate of lime and di-sodium arseniate. The gradual precipitation thus brought about resulted in the formation of a group of crystals exactly resembling those of pharmacolite-monoclinic prisms of a pearly luster and

frequently possessing a pink tint. The chemical analysis of the crystals led to the formula $\text{HCaAsO}_4 \cdot 2\text{H}_2\text{O}$; and the substance thus becomes chemically as well as physically isomorphous with brushite, the corresponding phosphate of calcium, $\text{HCaPO}_4 \cdot 2\text{H}_2\text{O}$.

Atomic Weights.—The following new method for the determination of the atomic weight of oxygen was described by W. A. Noyes at the American Association:

The apparatus to be used consists of a U-tube, filled with copper oxides, to one side of which is attached a tube with a capacity of about 20 cc., and to the other side a three-way stop-cock. The U-tube is first exhausted and weighed; it is then heated, and pure hydrogen is passed in. The hydrogen is converted into water, which then condenses in the tube on the opposite side from the stop-cock. The gain in weight of the apparatus gives the weight of the hydrogen. After weighing, the gases remaining in the apparatus are pumped out and analyzed. The water is also expelled, and from the loss in weight of the apparatus the weight of oxygen is determined. The advantages of the method are: The weight of the hydrogen is determined directly; the weight of the oxygen is also found directly and independently of the weight of the hydrogen; each is weighed in a vacuum, and the usual correction of the weights to a vacuum becomes unnecessary; impurities in the hydrogen, and especially any nitrogen which it contains, will be detected and the amount determined; finally, no error can result from incomplete combustion of the hydrogen.

In the report of the Committee on Electrolysis of the British Association, a direct determination of the ratio between the atomic weight of copper and that of silver, based upon the electrolytic experiments of W. N. Shaw, is made to give $\text{Ag}:\text{Cu}=17:10$; whence the atomic weight of copper is made 63.383, or, corrected, 63.560. This value being different from that ordinarily received, a direct determination was made, at the request of Prof. J. P. Cooke, by T. W. Richards. This experimenter deduced an atomic weight for copper of 63.44, which, although it does not exactly coincide with Shaw's results, is nearer to them than the old accepted value of 63.17.

The atomic weight of didymium, freed from all other allied metals known at that time, was determined by Cleve, in 1874, as 147. After the discovery of samarium as an accompaniment to didymium, and under evidence that it was present in the sample examined by him, the author made a new determination of the atomic weight of didymium, freed from samarium, as 142.3.

With the atomic weight 198.6, osmium has formed a notable exception to the periodic law, standing at the opposite end of the platinum group from where its other properties would place it. The atomic weight of this metal has now been redetermined by Prof. Seubert by means of the analysis of the pure double chlorides of osmium with ammonium and potassium, and is fixed at 191.1. This gives to it its proper place in the periodic classification, as before iridium.

Considering that it is desirable that all determinations of atomic weights should be con-

nected as directly as possible with hydrogen, J. W. Mallet describes a method by which this may be done in the case of gold. A known weight of zinc is dissolved in dilute sulphuric acid, and the hydrogen evolved is measured. A solution of bromide or chloride of gold is then treated with zinc more than sufficient to precipitate the whole of the gold, the residual zinc being determined by the hydrogen evolved on treatment with sulphuric acid. The difference in volume of hydrogen obtained gives a direct means of calculating the atomic weight of gold.

Chemistry of Plants.—Helen C. De S. Abbott is convinced that a similarity of one or more chemical constituents is to be found in all plants which have reached the same stage of evolution—that there is a development in chemical constitution, closely connected with their morphological evolution, which plants pass through—and hence that chemical character, as indicating the height of the plant in the scale of progression, is essentially appropriate for a basis of classification. Some one compound, as saponin, will be found with similar botanical characters in plants of distinct genera and families on the same plane of evolution or development. Chemical constituents of plants are found in varying quantities during stated periods of the year. Certain compounds present at one stage of growth are absent at another. Different parts of plants may contain distinct compounds; whether any of the constituents found in plants are, as has been said, the result of destructive metabolism, and of no further use in its economy, or not, it is a significant fact that certain cells, tissues, or organs peculiar to a plant secrete or excrete compounds peculiar to them which are to be found in one family, or in species which are closely allied.

The chemistry of the onion as a field-crop has been studied by R. W. E. McIvor, in Australia. The soil in which the plant is grown is a chocolate loam of basaltic origin containing in a virgin state sometimes as much as 0.28 per cent. of nitrogen and 0.20 per cent. of phosphoric acid extractable by hydrochloric acid. While non-nitrogenous guanos and superphosphates have in a few instances slightly increased the crop, it has been found that manures containing nitrogen in the form of sulphate of ammonia or as a constituent of blood-guano produce more satisfactory results. The liberal use of superphosphate mixed with sulphate of ammonia has invariably proved more beneficial on the poorer land than superphosphate alone. The largest returns, however, have resulted from the joint use of a fertilizer composed of the sulphates of ammonia and potash and superphosphate. The farmers are of opinion that onions produced by the aid of purely chemical manures keep in good condition for a longer period than those obtained from ground which is naturally "forcing," or which has been recently manured with rich farmyard manure. It seems fairly clear to the author that the on-

ion, "in common with other crops," depends upon the soil for its supplies of nitrogen. The mean composition of air-dried onions growing on unmanured land was found to be:

Water	894.8
Combustible matter (N = 2.87)	101.0
Ash	4.2
Total	1,000.0

The total nitrogen and mean composition of ash show that an average crop of, say, eight tons will remove from an acre:

	Lbs.		Lbs.
N	42.48	P ₂ O ₅	10.88
K ₂ O	29.86	Cl	0.80
Na ₂ O	1.88	SO ₂	22.90
CaO	6.52	SiO ₂	1.72
MgO	2.70	Total	119.54
Fe ₂ O ₃	0.80		

The total sulphur in air-dried onions was found to average 0.051 per cent.

The presence of aluminum was supposed to be peculiar to *Lycopodium* among plants; but Prof. Church has found traces of it in the ashes of many other plants. It occurs in all the species of *Lycopodium* which were examined, except those which are of epiphytic habit, but not in the allied genus *Selaginella*; and in the ashes of some—but not all—tree-ferns, in large proportions.

Domestic Chemistry.—The results of observations of the effect of free carbonic acid in potable water on leaden pipes have been summarized by E. Reichardt. Only water containing free carbonic acid has been found to attack the pipes. The view that lead pipes conducting such water become incrustated gradually, and thereby capable of resisting corrosion, has not been proved. Except with hard waters holding much lime, no deposit has been observed, even after years of use. Mountain springs do not usually contain more than enough free carbonic acid to dissolve the mon carbonate of lime present, often hardly enough to form bicarbonate; but sometimes waters holding much lime in solution have more. Experiments thus far show that these spring-waters do not attack lead in more than the most minute degree. River-waters more frequently contain free carbonic acid than spring-waters, but in far smaller quantity. It has thus far been found that waters containing bicarbonates do not attack lead, and even free carbonic acid, in small quantities, is without effect in the presence of much lime and magnesia. But the less mineral matter a water contains, or the "softer" it is, the more readily is lead dissolved. Distilled or carbonic-acid-free water dissolves lead slowly with separation of oxyhydrate; distilled water holding carbonic acid in solution dissolves lead in much larger quantity, with a separation of basic lead carbonate, which can be very complete. Water to be conducted through lead pipes should, under all circumstances, be examined for free carbonic acid and the amount determined. Its action on lead plates should also be noted.

In the experiments of J. H. Long, made in

July and August, 1886, to determine the rate of oxidation or destruction of the sewage of the city of Chicago, which is carried through the Illinois and Michigan Canal to the Illinois river, examinations were made of the dilute sewage at the point (Bridgeport) where it is pumped into the canal, and of specimens of the water taken on the same day at stations selected at intervals through a distance of 159 miles, in which a total descent of 1,467 feet occurs. The conditions of the tests were variously complicated at the several stations, so that no absolute result was possible; but the experiment as a whole was interpreted as showing "in a fair and unmistakable way the general fact of the gradual purification of a highly contaminated water by what may be broadly termed oxidation"; and importance is claimed for the investigations "as showing pretty fully the rate at which a city's sewage is destroyed under certain conditions of temperature, dilution, and velocity of flow." Investigations were also made in the succeeding winter—December, January, and February—to ascertain the effect of cold. The results were marked by perplexing irregularities, but tended to show a slow rate of change at that season.

Prof. Atwater has published some of the results of his analyses of the flesh of American fishes in tables which give severally the proximate ingredients, as directly determined, of the flesh, and of the water-free substance of the flesh; the percentages of phosphoric acid, sulphuric acid, and chlorine in the flesh; classification of fish by percentages of flesh, chiefly muscular tissue, in the entire body; classification by proportions of water-free substance in the flesh; classification by proportions of fat in the flesh; composition of water-free substance in flesh of preserved fish; composition of flesh in preserved fish; and composition, including both flesh and refuse. Other analyses have been reported—of cod by Prof. Chittenden, and of menhaden by Prof. G. H. Cook; comparisons of the groupings made by the author according to the percentages of the different classes of constituents with the classification by families as practiced by ichthyologists, show no very definite connection between the two. In the analyses of preserved fishes, the replacement of the water in the flesh by salt is remarked upon as a matter of physiological interest.

As a simple and inexpensive freezing-mixture, J. A. Bachman has used the spent nitrosulphuric-acid mixture which had been employed in a Grove battery, with snow. At temperatures of about zero Centigrade, this acid, with various proportions of snow, gave a fall of from thirty to thirty-two degrees of temperature, or nearly the same as that obtained when simple hydrochloric acid is employed. As there was so little difference in the result when the snow was used within considerably wide limits of proportion, it was found most satisfactory to mix the snow with the acid until it reached the consistency of a thin mush, dispensing with

weighing. The temperature obtained when the snow is wet is almost as low as when it is dry, which is not the case when hydrochloric acid alone is used. When working at a temperature near zero, the spent acids answered as well as, if not better than, hydrochloric acid; but when endeavoring to obtain lower temperatures than -80°C . by previously cooling the acid, better results were obtained with hydrochloric acid.

Out of a large number of chemical compounds experimented upon, Prof. William Thomson has found that those having the most remarkable antiseptic properties are the compounds of fluorine, hydrofluoric acid, the acid and neutral fluorides of sodium, potassium, and ammonium, and the fluo-silicates of those bases. Of these, sodium fluo-silicate is perhaps the best suited for an antiseptic. It is not poisonous, possesses no smell, and is sparingly soluble in water. It has only a very slightly saline taste, and may therefore be employed in preserving food without communicating any taste to it. A saturated solution containing 0.61 per cent. of the salt is not irritating to wounds, while it possesses great antiseptic power for animal tissues.

The value of phosphorus pentoxide as a disinfectant has been measured by Dr. Kinyoun, in experiments on cultivations of the micro-organisms of anthrax, yellow fever (Finlay), typhoid fever, Asiatic cholera, and cholera nostras, the nutrient medium being agaragar. The cultivations were divided into series according to the way they were covered. The result of the experiments was the conclusion that this substance is a surface disinfectant only, having little, if any, penetrating power, and is wholly unfit for fumigation and disinfection where penetration is desirable; and that its limited scope of usefulness is altogether met in the use of bichloride of mercury.

P. Bockairy, in testing butter, substitutes toluene for benzine. The test-tube is heated to 50°C ., and shaken up so as to mix the two liquids. If the sample is a fat, turbidity immediately occurs, but if it is butter, even if mixed with fat, the two liquids mingle without turbidity. The purity of the butter is determined by keeping the test-tube for half an hour in water at 40°C . If the butter is pure, there is no turbidity, but if it contains a foreign fat, turbidity at once appears, and ultimately a precipitate.

From examinations of certain waters—one of them being a "mineral" water free from all possible sources of contamination—Prof. E. H. S. Bailey has been led to consider that free ammonia may be sometimes a natural constituent, and not indicative of any pollution, of the water.

Apparatus.—For preserving constant the vacuum employed in fractional distillation, Godefroy uses two vertical tubes united at their lower ends by a fine tube, of which, when

they are not in use, one, A, is entirely filled with mercury, while the other, B, contains more or less mercury, according to the vacuum desired. The tubes are so adjusted that as soon, on making the exhaust, as the pressure in B is less than will support the mercury column in A, this column falls, and the mercury rises in B till it cuts off the outlets connecting with the exhaust.

A new form of apparatus for fractional distillation, by Dr. J. Tcherniac, in the technical transformation of ammonium sulpho-cyanide into calcium sulpho-cyanide, is described by T. H. Norton and A. H. Otten. The novel feature is the introduction of a device called a *déverseur*, to prevent the frothing accompanying the rapid distillation of the ammoniacal liquor.

Edward Hart has devised a simple apparatus, such as can be made by an amateur glass-blower, for fractional distillation. The principle of it is the familiar one of the "dephlegmator." The bent tube is so adjusted that the condensed portion runs down and passes around its inside at each bend, while the vapor passes upward through the ring of descending liquid.

In an apparatus by Ramsey and Young for determining vapor-densities of solids and liquids, a test-tube, having inserted from its top a thermometer with its bulb covered with cotton, is put in communication with a Sprengel pump. The apparatus having been cooled and exhausted, the liquid to be examined is allowed to trickle down the thermometer and moisten the cotton. The stream of liquid having been cut off, the pressure and temperature are noted as soon as they become constant. Air is then admitted, and a second reading of pressure and temperature is taken. If the experiment is made with a solid, the bulb of the thermometer is previously covered with it by dipping into the melted substance.

An improved form of apparatus for gas analysis described by J. T. Willard is essentially a combination of Elliott's and Frankland's apparatus for the analysis of gases incident to water analysis, with important modifications and additions. It was designed for use with mercury, but admits the employment of water.

In W. Thomson's improved form of Lewis Thomson's instrument for determining the calorimetric value of fuels and organic compounds, the substance is burned in a stream of oxygen instead of with potassium chloride.

A new apparatus for condensing gases by contact with liquids, described by Prof. Lunge, consists of a series of perforated plates made of stone-ware, arranged in column. The gases as they rise are brought into immediate contact with an extensive plane surface of the absorbing liquid.

An electrolytic method for liquefying gases is employed by H. N. Warren, which is described as being better adapted than the usual method, when a compound gas, like HCl, is required.

In Knublauch's improved form of apparatus for the determination of sulphur in coal-gas, a metallic holder is filled with gas, and water is turned on. The gas, together with five or six times its volume of air, is drawn into a combustion tube and over heated asbestos. The sulphur products are absorbed in a solution of potassium carbonate.

Improvements in apparatus for rapid gas analysis by Dr. Arthur H. Elliott consist in reducing the length of the tubes by enlarging the upper portion of the bulbs, and by substituting a solution of bromine in potassic bromide for the liquid element to absorb illuminants.

For the generation of sulphuretted hydrogen or hydrogen gas, J. H. J. Dagger uses a glass vessel containing hydrochloric acid, which is connected from its lower tubulure, by means of a flexible tube, with the generator, and the two vessels, supported by wooden forks, are arranged at different heights and fixed to the side of the H_2S cupboard. The lower part of the generator is filled to about half an inch above the end of the acid-tube with pieces of glass or glass marbles; above this layer is the iron sulphide or the zinc, as the case may be, in small pieces. The flow of gas can be stopped or regulated by altering the levels.

An adjustment of the Reichard's aspirator has been applied by Prof. LeR. O. Cooley as part of an apparatus for removing noxious vapors in the evaporation of corrosive liquids.

To obviate the liability to accident from the bumping that follows an explosion in Liebig's trough, Arthur Michael places an India-rubber plug on the bottom of the trough, and holds the eudiometer firmly down upon it.

An apparatus has been devised by Thomas C. Van Nys for the estimation of carbonic acid by means of barium hydrate, the chief purpose of which is to afford means for preventing the contact of external air containing carbonic acid with the barium hydrate when triturated with oxalic acid or when filtered and washed.

Mr. Fletcher, of Warrington, has introduced a tubing made of two layers of India-rubber with soft tin-foil vulcanized between, which is said to be gas-tight under any pressure, and free from smell after long-continued use, while it retains the flexibility and elasticity of an ordinary rubber tube.

Nickel has been found by Prof. Dittmar to be a most durable material for making basins in which to conduct operations with aqueous caustic alkalis.

In an apparatus described by G. H. Bailey for maintaining constant temperatures up to $500^{\circ} C.$, the substance to be heated is placed in a glass tube, together with the bulb of an air-thermometer, and these are inclosed in a wider tube resting on the iron casing of a furnace. The air-thermometer serves to measure the temperature, and is connected with a gas-regulator, by which means the temperature may be kept constant at any desired degree.

A source of error in experiments, due to the formation of carbonic dioxide by the action of ozone on the cork stoppers, and India-rubber connectors of the apparatus, has been detected by Kieser and F. H. Storer, of Bussey Institute. H. Karsten had also observed that such connectors are liable to oxidation, even in mere air and at ordinary temperatures. He found the yield of carbonic acid increased fourfold when non-nitrogenized substances were exposed to air ozonized by phosphorus instead of to ordinary atmospheric air.

Miscellaneous.—The address of Prof. Tilden, as vice-president for 1888 of the chemical section of the British Association, was devoted largely to the subject of chemistry teaching, which, in spite of the great advance of the science, was still hampered, he said, by the ignorance and indifference of the public. One man is required to teach college classes, both elementary and advanced, in pure and applied chemistry, inorganic and organic, theoretical and practical. "This is a kind of thing which kills specialism, and without specialists we can have not only no advance, but no efficient teaching of more than rudiments. That teachers ought to engage in research at all is by no means clear to the public and to those representatives of the public who are charged with the administration of the new institutions. . . . A popular mistake consists in regarding a professor as a living embodiment of science—complete, infallible, mysterious; whereas in truth he is, or ought to be, only a senior student who devotes the greater part of his time to extending and consolidating his own knowledge for the benefit of those who come to learn of him, not only what lies within the boundaries of the known, but how to penetrate into the far greater region of the unknown. Moreover, the man who has no intellectual independence, and simply accepts other people's views without challenge, is pretty certain to make the stock of knowledge with which he sets out in life do service to the end." The little demand among school-masters for high attainments in chemistry, the indifference of manufacturers who, when they want chemical assistance, instead of employing trained chemists are often satisfied with the services of boys "who have been to an evening class for a year or two," and the difficulty of finding a satisfactory career in connection with chemistry, are assigned as other reasons for the lack of attention to the efficient teaching of the science. The disposition to encourage young chemists to engage in investigation and attack difficult problems, may be carried too far. "Already we are in danger of losing the art of accurate analysis. One constantly meets with young chemists who are ready enough to discuss the constitution of benzine, but can not make a reliable combustion. And, according to my own experience, attempts at research among inexperienced chemists become abortive more frequently in consequence of deficient analytical skill than from any other cause."

An unnecessary amount of time is often spent on qualitative mineral analysis, while an acquaintance with the properties of common and important carbon compounds ought to be acquired at an early stage. Quantitative work—serious work, in which good methods are used and every effort made to secure accuracy—might with advantage be taken up much sooner than usual. One of the best means of preparing for original research is to select suitable memoirs, and to work conscientiously through the preparations and analyses described. "When chemistry is taught, not with professional or technical objects in view, but for the sake of educational effects, as an ingredient in a liberal education, the primary object is to make the student observe and think. But with young students it is very important to proceed slowly, for chemistry is really a very difficult subject at first."

Concerning the constitution of meteorites, Prof. Lockyer names fourteen elements which occur most constantly in such bodies, and eleven others which occur less frequently or in smaller quantities. Of them, only hydrogen, nitrogen, and carbon occur in an elementary condition. Hydrogen and nitrogen are asserted to be occluded as gases by the stones. Carbon exists in the forms of graphite and the diamond. The proportion of compound substances known on the earth that are found on meteorites is smaller, many terrestrially common ones being absent. Thus, free quartz has not been found in any meteors. Many of the meteoric chemical combinations, on the other hand, are unknown to terrestrial mineralogy. A compound of carbon with hydrogen and oxygen exists as a white or yellowish crystallizable matter, soluble in ether and partly so in alcohol, and exhibiting the characters and the composition of one or more hydrocarbonaceous bodies with high-melting points. Various alloys of nickel and iron occur, with which magnesium is always associated, the four principal of which have respectively six, ten, fourteen, and sixteen equivalents of iron to one of nickel. Among other minerals are Lawrencite, protochloride of iron; Maskelynite, with the composition of labradorite; and silica (as asmanite). Among the compounds identical in composition and crystallographic character with minerals found on our globe, are magnetic pyrites, magnetite, chromite, and the following silicates: olivine varieties, enstatite and bronzite, diopside and augite, anorthite and labradorite, and breunerite. The oxides of carbon have been detected in many meteorites, where they are assumed to have been occluded. When the meteoric substance is heated and examined with the spectroscope, the most volatile elements appear first, and so on in regular order, and this without regard to the proportions in which they are respectively present.

The blackening of silver chloride under exposure to light has been accounted for in various ways. Some chemists attribute it to a

reduction of the chloride to metallic silver, while others believe that a subchloride is formed. Experiments by Spencer B. Newberry support the former view. The salt was exposed under water with frequent stirring to expose fresh surfaces to the light, and constant circulation of air resulted—in each case under two distinct processes of separation—in the production of metallic silver.

The differentiation of yeast is presented by Mr. O. G. Matthews, of Burton-on-Trent, as an exceedingly interesting field for experiment, in which may be found some of the causes of yeast deterioration. There are many species of *saccharomyces*, and of so nearly equal vitality, that a variety of ferments are often present in what the brewer may regard as a pure yeast. Variations in the character of a fermentable liquid tending to the nourishment of certain ferments, rather than others, may determine the growth of a majority of one species, especially in the case of spontaneous fermentations. A natural selection has doubtless taken place in the case of brewer's yeast, which may be regarded as an educated and modified form from spontaneous or air-sowed fermentation; and all ordinary yeasts contain a preponderating quantity of this selected form. It is not until an abnormal percentage of some other kind appears that its presence is demonstrable, though some time before this the yeast may have exhibited peculiarities in its action. Hayduck has traced a connection between the amount of nitrogen yeast contains and its fermentative capacity, and has found that an increased nitrogen percentage is accompanied, as a rule, by increased fermentative power; but that after a certain limit, the latter diminishes. Yeast takes up nitrogen in proportion to the amount of that constituent existing in the wort, and will take up more at a higher than at a lower temperature. If quick yeast be carried through consecutive worts of high gravity, a marked deterioration ensues—owing, doubtless, to a depleted state of the ferment. It has become so rich in protoplasmic constituents that saccharine solutions no longer exert their normal stimulating effect, and it is quite possible that in addition the cells are alcoholized or partially asphyxiated. Such deteriorated yeast may be restored to activity by fermentation in a comparatively weak wort, and it is a fair reasoning that the surplus constituents are passed into new cells without drawing entirely on the cell-forming constituents of the wort. The visible deterioration of yeast by the accession of bacteria is a matter of high importance. All through the process air-borne germs are being conveyed into the products, and when the opportunity arrives they take effect, and this opportunity occurs when the vitality of the yeast has been lowered; for a healthy fermentation precludes their development. Bacteria then may be reasonably regarded as both cause and effect in yeast degeneration.

CHILI, an independent republic of South America. (For details relating to area, see "Annual Cyclopædia" for 1884.) Final returns of the census of Nov. 26, 1885, showed the population at the time to have been 2,527,320, exclusive of 50,000 wild Indians, and including 51,882 foreigners.

Government.—The President is Don Manuel Balmaceda, whose term of office will expire on Sept. 18, 1891. The Cabinet was composed in 1888 of the following Ministers: Foreign Affairs, Don Demetrio Lastavria; Interior, Don Pedro Lucio Cuadra; Treasury, Don Enrique S. San Fuente; Industries and Public Works, Don Vicente Davilla Larrain; War and Navy, Don Evaristo Sanchez Fontenilla; and Justice, Señor F. Puga Borne. The Chilean Minister to the United States is Don Domingo Gana. The Consul-General in New York is Don Federico A. Beelen; the Consul-General for California, Nevada, and Oregon, resident at San Francisco, is Don Juan de la Cruz Cerdá. The United States Minister to Chili is William R. Roberts; the American Consul at Valparaiso is James W. Romeyn.

Army.—The strength of the permanent army was fixed by law of Dec. 30, 1887, at 5,385, consisting of two regiments of artillery; one battalion of sappers; eight of foot, and three regiments of horse, to be added to which there is a coast artillery force of 500; constituting in the aggregate 5,885 men, commanded by 932 officers. The military school is attended by 115 cadets. The National Guard, organized under provisions of the law of Sept. 26, 1882, is composed of 90 corps, numbering in the aggregate 48,674 file.

Navy.—In conformity with the provisions of the law of Dec. 30, 1887, there were in active service in 1888 two frigates and one monitor, all armored vessels; three corvettes; three cruisers; two gun-boats; one transport; four "escampavias," and eleven torpedo-boats, out of thirty-one vessels composing the Chilean fleet, with a joint tonnage of 17,495. The navy was commanded by 55 officers; there were 239 surgeons, pilots, and apprentices on board, and 1,988 sailors and marines. The naval school at Valparaiso was attended by 70 cadets.

Public Works.—In April the work connecting Lake Vichuquen with the ocean was begun. This work will result in the formation of a strong military port.

Finances.—The foreign indebtedness of Chili consisted, on Jan. 1, 1888, of the following outstanding bonds: 3-per-cent. loan of 1843, \$533,000; 4½-per-cent. loan of 1885, \$4,024,000; 4½-per-cent. loan of 1886, \$30,050,000; and 4½-per-cent. nitrate certificates, \$5,830,005; constituting a total of \$40,437,005, money chiefly expended in the construction of Government lines of railway; consequently, Chili has something to show for what she owes abroad. The home debt was contracted partially during the war of independence, in part also for the building of railroads, and finally

during the war with Spain and the one with Peru and Bolivia; 3 and 7 per cent. bonds were issued, and since 1887 the latter have gradually been reduced through the operations of the sinking-fund; of these bonds, there were outstanding, on Dec. 31, 1887, \$6,543,900; furthermore, \$16,965,756, for which there exists no sinking-fund, and, finally, there are \$24,887,916 paper money, the internal debt thus reaching, in the aggregate, the sum of \$48,397,572, on Dec. 31, 1887, as compared with \$49,917,637 on Dec. 31, 1886; which at the time included \$26,687,916 paper money; of which, consequently, during the twelve-month, \$1,800,000 had been withdrawn from circulation and destroyed.

The actual income in 1887 was \$45,888,953, as compared with \$17,000,000 in 1877, and \$9,000,000 in 1866, whereas the actual outlay in 1887 was only \$37,113,408 for ordinary and extraordinary expenditures; so that a surplus resulted of \$8,775,545. On Dec. 31, 1887, the Chilean treasury held in cash the sum of \$21,277,710, without counting the bar-silver retained as reserve to secure the note circulation, and without the \$2,298,754 of capital and interest which Peru was then still owing Chili. The budget for 1889 estimates the revenue at \$46,000,000, and the expenditure at \$53,000,000, the deficit to arise from railroads which the Government intends building, in conformity with the authority obtained from Congress under date of Jan. 20, 1888.

The Council of State sanctioned the plan authorizing the President to spend the sum of \$1,204,000 for the purpose of canceling the county debts of the republic with the exception of those of Valparaiso and Santiago.

On Aug. 7, 1888, the contract terminated which gave to certain banks the privilege of issuing bank-notes; there were in all eighteen banks enjoying the advantage named, and on a cash capital of \$28,111,887, their circulation amounted to \$16,061,262. The three leading banks circulating notes, comprised in the above sum, are the Banco Nacional, with a capital of \$6,000,000, and a circulation of \$4,500,456; the Banco de Valparaiso, capital \$5,125,000, issue \$4,098,812; and the Banco de Santiago, capital \$4,000,000, issue 2,673,600. The Government intends to decree in the future the free issue of bank-notes under the proviso of the guarantees stipulated by section 7 of the law of March 14, 1887.

Charitable Institutions, etc.—The Government paid subsidies to hospitals, lazarettos, vaccination offices, and to the fire departments, to the amount of \$650,600, distributed among 225 establishments. The police was subsidized by \$471,900. For 1888 there had been set aside for the benefit of all the institutions named \$1,196,140.

Cholera.—Between Dec. 25, 1887, and Feb. 3, 1888, there were in Valparaiso alone 4,500 cases of cholera, 1,357 proving fatal; the epidemic disappeared gradually with the advent

of cool weather, but during the first fortnight in March, there were still 201 cases of which 77 resulted in death.

Postal Service.—The number of post-offices in operation in 1887 was 481, dispatching during the year 37,808,210 items of mail-matter. The number of ordinary letters handled in the mails in 1886 was 14,299,883; registered letters, 125,902; sample packages, 89,639; judicial notifications, 15,392; Government messages, 708,255; and newspapers, 20,124,139; together, 35,808,210, dispatched in 1886. The receipts in 1887 were \$483,439, nearly balancing the expenses. Postal money-orders were paid out in 1886 to the amount of \$1,633,322. The Government paid subsidies to ocean steamers for carrying the correspondence in 1886 to the extent of \$223,880.

Railroads.—The Chilean railroad system, on Dec. 31, 1887, consisted in the first place of Government lines:

	Length in kilometres.
Santiago to Valparaiso.....	187
Branch line, Las Vegas to Santa Rosa.....	45
Santiago to Maule and San Fernando to Palmilla, branch line.....	804
Santiago to Concepcion.....	418
Angol to Traiguen.....	73
Renaco to Victoria.....	75
Total.....	1,096

Next of private lines:

	Kilometres.
Arica to Tacna.....	68
Pisagua to Tres Marias.....	106
Iquique to Virginia.....	194
Paillos to Salitras del Sur.....	98
Mefillones to Cerro Gordo.....	39
Antofagasta to Ascotan.....	297
Taltal to Refresno.....	82
Chañaral to Las Animas.....	60
Calders to Copiapó.....	242
Carrizal Bajo to Cerro Blanco.....	81
Cochimbo to La Serena.....	15
Ovalle to Panulicillo.....	128
Serena to Rivadavia.....	73
Tongoy to Tamaya.....	55
Lanqueto to Maquegua.....	40
Total.....	1,538

The Government lines projected, toward the cost of which Congress voted in 1888 the sum of £3,517,000, or its equivalent, were:

	Kilometres.
Victoria to Valdivia.....	403
Coihue to Mulchen.....	48
Concepcion to Cañete.....	160
Tomé to Cauquenes.....	200
Talca to Constitucion.....	85
Palmilla to Pichilemu.....	45
Peleguen to Peumo.....	35
Santiago to Melipilla.....	59
Santiago to Peñon.....	27
Calera to Cabildo.....	76
Villos to Salamanca.....	128
Ovalle to San Marcos.....	60
Gusaco to Vallenar.....	48
Total.....	1,869

Other Means of Internal Transportation.—In the cities of Santiago and Valparaiso there are comfortable tramway lines; in the former a distance of 60 kilometres, in the latter of 10. There are tramways, moreover, at Concepcion, Copiapó, Ohillan, Limache, Rengo, Quillota, San Felipe, Santa Rosa, Serena, and Talca. There are besides in the country about 800

wagon-roads measuring 66,000 kilometres in length, and 2,000 ordinary roads of a total length of 40,000 kilometres. Seventy-eight water-courses are navigable a distance of over 4,800 kilometres.

Telegraphs.—The Government owns nearly all the telegraph lines in operation, there being 150 offices in 1886, increased to 170 in 1887. The length of line was 10,300 kilometres, and of wire 12,148, the entire cost of which has only been \$844,325. There were sent 419,777 private telegrams in 1886, bringing \$121,248, and 112,819 Government messages charged \$80,476. Private lines exist between Santiago and Valparaiso, Arica and Tacna, Santa Rosa de Los Andes and the Argentine Republic, and a cable runs along the coast. Concessions have been granted to build additional private lines between Arica and Tacna, Serena and Coquimbo, Santiago and the Condes mines, and Concepcion and Talcahuano. Telephone lines are in operation at Santiago, Valparaiso, and in other cities.

Commerce.—The foreign-trade movement in Chili has been as follows:

ITEMS.	1886.	1887.
Import.....	\$47,101,850	\$46,680,869
Increase.....		1,522,512
Export.....		
Products of the mines.....	40,364,840	49,449,015
Agricultural products.....	9,710,747	9,869,347
Manufactures.....	66,521	48,081
Sundry merchandise.....	107,291	46,655
Gold coin.....	644,416	817,485
Re-export.....	446,784	821,475
Total.....	\$51,240,149	\$59,549,958
Increase.....		8,309,809

Chili produced in 1887 29,150 tons of fine copper, compared with 35,000 in 1886; the export during the first nine months of 1888 was 23,675 tons fine, against 22,990 during the corresponding period of the previous year.

The Chilean exportation of nitrate of soda has been as follows:

DESTINATION.	1885.	1886.	1887.
	Quintals.	Quintals.	Quintals.
To Northern Europe.....	8,554,637	7,950,452	26,851,720
To the Mediterranean.....	41,980	163,092	287,875
To the United States on the Atlantic.....	827,296	1,436,159	1,582,026
To the United States on the Pacific.....	77,712	253,505	229,946
Total.....	9,501,625	9,805,208	15,851,567

The American trade with Ohili exhibits these figures:

FISCAL YEAR.	Imports from Chili into the United States.	Domestic exports from the United States to Chili.
1883.....	\$435,584	\$2,887,551
1884.....	537,986	3,236,945
1885.....	604,525	2,192,672
1886.....	1,152,845	1,978,548
1887.....	2,863,283	2,062,507
1888.....	2,594,520	2,423,808

General Production.—The "Sinopsis Estadística," Santiago, 1887, sums up the productive

activity of the republic in the following words: "Agriculture, in its main branches, produces annually, on the average, 7,000,000 hectolitres of wheat, 8,000,000 hectolitres of barley and other cereals, and a proportionate amount of vegetables and fruit peculiar to the temperate zone. In 1886 the country exported over 1,800,000 hectolitres of wheat in the grain and in the form of flour, and 266,800 litres of wines. Cattle production amounts to 500,000 head per annum, and that of sheep and goats to 2,000,000 on an average. The mineral branch turns out some 25,000 to 40,000 tons of copper, 160,000 kilogrammes of silver, 10,000,000 tons of coal, over 15,500,000 quintals of nitrate of soda, large amounts of manganese, and for the working of metals, etc., there are in operation foundries and machinery of the first class. Manufacturing furnishes an ample supply of ordinary commodities. There are a great many flour-mills and other factories. A large sugar-refinery is in operation at Viña del Mar, near Valparaíso, while at Santiago there is a wool-weaving establishment producing fine cloths, etc., and smaller ones are to be met with in the interior, as well as other industries. Exclusive privileges are granted to newly invented industries foreign to the country, and a good many such are in course of exploitation."

Merchant Marine.—There were afloat under the Chilean flag on March 15, 1887, 87 steamers with a joint tonnage of 18,769; 7 ships with 7,866 tons; 91 barks with 45,989 tons; 5 brigs with 1,514 tons; 8 schooner-brigs with 2,295 tons; 12 schooners with 1,225 tons; and 19 sloops with 1,058; together, 179 vessels with 78,716 tons. Two new steamers and 16 sailing-vessels were registered during a twelve-month, while 2 steamers and 10 sailing-vessels were either sold or wrecked. The maritime movement in 1886 was, vessels entered, 9,568, with a joint tonnage of 8,081,229, and 9,654 sailed, measuring jointly 8,868,887 tons, bringing 47,167 passengers and taking away 41,082, so that 6,185 remained in port.

Education.—The Chilean university at Santiago is called the "Instituto Nacional." In 1886 422 students attended the lectures on law and political science; 290 on medical science; 122 on pharmacy; 80 on physics and mathematics; and 104 cultivated the fine arts—i.e., drawing, painting, sculpture, and architecture; total number of students, 968. Four hundred and five diplomas were granted. The lycæums in the provinces, of which there are twenty-two, were attended by 3,892 pupils in the same year, so that altogether 4,860 youths were receiving a higher degree of education, and for 1888 Congress set aside a subsidy of \$829,694 for the same purpose. The free schools numbered 862, with 78,810 pupils, the average attendance being 47,780; there are besides normal schools; and for all public schools Congress voted a subsidy of \$1,406,000 for 1888; adding thereto salaries of professors, teachers, pensions, and money spent on new school-buildings and

libraries, Chili spent in a single year on education \$4,957,437.

Newspapers.—The number of periodical publications throughout the country in 1888 was 130; 30 in Santiago, 15 in Valparaíso, 5 in Iquique, 4 each in Concepción, Copiapó, Curicó, Serena, and Talca, 3 each in Ancud, Angales, Cauquenes, Chillán, San Carlos, San Felipe, Valdivia, and Freirina, and 2 each in Ligua, Melipilla, Osorno, Pisagua, Quillota, Quirihue, Rancagua, and San Fernando—one in nearly every chief town of a department.

CHINA, an empire in eastern Asia. The Tsait'ien or Emperor, Hwangti, born in 1871, succeeded to the throne by proclamation, Jan. 22, 1875, on the death of the Emperor T'ung-chi. He is the ninth Emperor of China of the Tartar dynasty of Ts'ing. During his infancy the affairs of the Government were directed by the Empress Dowager, widow of the Emperor Hienfung, in concert with Prince Ch'un, father of the present Emperor. On becoming of age, Feb. 7, 1887, the young Emperor assumed the government of his dominions though the Empress Regent still exercised the royal prerogative to a certain extent till July, 1888, when she retired from active state duties. The administration of the Government is under the direction of the Neiko or ministers of state, four in number, two Tartars and two Chinese, with two assistants from the Han-lin or Great College. Seven boards assist the ministers in the administration of the empire. In addition, there is a board of public censors, independent of the Government, consisting of from 40 to 50 members, under two presidents, one of Tartar and the other of Chinese birth. Any member of this board is privileged to present remonstrances to the Emperor, and one censor must be present at the meetings of any of the Government boards.

Area and Population.—The total area of China and its dependencies is 4,179,559 square miles, with a population of 404,180,000, not including Corea. In the latter part of 1886 there were 7,695 foreigners resident in the open ports, of whom 3,488 were British, 777 Japanese, 741 Americans, 629 Germans, 471 Frenchmen, and 819 Spaniards. More than half of the foreigners reside in Shanghai.

Finances.—As the receipts of the Government from internal sources are not made public, the amount of revenue can only be estimated. The ordinary revenue was estimated in 1886 at 66,400,000 haikwan taels, or about \$80,844,000, derived from the following sources: Land-tax, payable in money, 20,000,000 taels; rice tribute, 2,800,000 taels; salt-taxes, 9,600,000 taels; maritime customs, 15,000,000 taels; native customs, maritime and inland, and inland levy on foreign opium, 6,000,000 taels; transit levy on miscellaneous goods and opium, foreign and native, 11,000,000 taels; licenses, 2,000,000 taels. The receipts from foreign customs amounted in 1886 to 15,144,678 taels. The customs duties fall more upon exports than im-

ports. The main expenditure is for the maintenance of the army, which is estimated to cost 60,000,000 taels per annum. The total external debt was estimated at \$25,000,000 in 1887. A preliminary agreement was made with an American syndicate, contracting for the minting of money, and granting concessions for banking, negotiating loans, building and operating railroads, and opening and working mines. Revelations regarding the character of the intermediary, a Polish adventurer, and the opposition of British and German rivals of the *concessionaires*, led the Tsung-li-Yamen to reject the arrangement. The Chinese Government subsequently obtained from an English manufacturer the machinery and dies for coining new copper cash, which will be composed of less brittle metal than those now in circulation, and also silver taels or dollars, and 50, 20, and 10 cent pieces.

The Army.—The army consists in time of peace of about 250,000 men, and this number can be increased to about 850,000 in time of war. Most of the troops are armed with either Mauser or Remington rifles, and the Government possesses a good supply of Krupp 8-centimetre field-cannon. Large quantities of foreign-made arms have been purchased, and the arsenals of China, under foreign supervision, are beginning to turn out both arms and ammunition. Besides the Chinese and Manchu militias, each province possesses a regular army of enlisted troops under the command of its viceroy. The army of Pechili, which served as a model for the rest, has been instructed by European officers, and is well armed and uniformed. Fears of Russian aggression in the west and on the side of Corea have led to the reorganization of the army of Manchuria. There are 30,000 troops constantly under arms, including 15,000 from the Pechili army, which form a nucleus. The total military strength of the three districts into which Manchuria is divided is from 250,000 to 300,000 men. There are breech-loading rifles provided for about one third of them, while the others are armed in part with muskets. The cavalry carry Winchester or Remington repeating-rifles. The Russian Ussuri frontier is fortified, and the towns of Kirin and Ningati are girdled with forts, some of which are strengthened by steel plates. There is a line of telegraph from Peking to Aigun on the Amoor river. The administration of the Ili territory was reorganized in June, 1888. The soldiers receive good pay and food unless they are defrauded by their officers. The garrison at Umrtsi, which had not been paid for six months, formed a plot in June to murder Liu Tsin Tan, their commander-in-chief and the governor of the new dominion. They laid a mine of powder under his residence, but the plot was divulged just before the time for its execution, and the chief conspirators, numbering thirty men and officers, were cruelly put to death. The Central Government seeks to make the military organization a means of

settling the thinly peopled expanse of Manchuria and Mongolia, and apportioning lands among the soldiers. This policy is followed not only for the purpose of raising a more effectual bulwark against Russian encroachments, but also to relieve the congested parts of China, and create a field for colonization where the Chinese emigrants will escape the hostile edicts and oppressive regulations that are driving them back from foreign shores. The Bannermen, or Manchu soldiery, number 90,000 or 100,000 at Peking, where they form an imperial guard to protect the dynasty against external or internal foes, while 20,000 more are distributed among the chief cities of China. They are not pure Tartars, because there are not more than 1,000,000 people of unmixed Manchu blood among the 23,000,000 now inhabiting Manchuria, where a reserve army of 183,000 Bannermen is kept up.

The Navy.—The iron-clad navy in 1887 consisted of two powerful armored ships, built in Germany, of 7,335 tons displacement, 6,000 horse-power, and a speed of 14½ knots. Each is protected by 14-inch armor, and carries four 12-inch Krupp breech-loading guns in two barbettes towers, *en echelon*, protected by 12-inch armor; one armored cruiser, built in Germany, of 2,300 tons displacement, carrying two 8-inch Krupp guns, *en barbette*, protected by 10-inch armor, and one 6-inch Krupp; two unarmored steel cruisers, of 2,200 tons displacement, carrying two 8-inch Armstrong guns, besides 40-pounders and machine-guns; two unarmored steel cruisers, of 1,400 tons displacement, each carrying two 25-ton Armstrong guns and four 40-pounders; twelve gunboats, each mounting a single heavy gun; two strongly armed corvettes, built at Stettin; and two fast armored cruisers, built in 1887 by Sir William Armstrong. The squadrons of Foochow, Shanghai, and Canton include between forty and fifty unarmored cruisers, corvettes, sloops, and gunboats. One cruiser of 2,150 tons displacement and 2,400 horse-power has been built in China, and others are in course of construction. There are also several swift torpedo-boats.

Commerce.—The total value of imports amounted in 1886 to 87,479,323 haikwan taels, or \$105,849,980, and the total exports during the same year to 77,206,568 haikwan taels, equal to \$93,419,947. The chief imports and exports, and their values for 1886, are as follow:

IMPORTS.		IMPORTS.	
	Haikwan taels.		Haikwan taels.
Opium.....	94,988,561	Coal.....	1,798,956
Cotton goods.....	29,049,658	Oil.....	2,215,027
Raw cotton.....	825,624	Seaweed, shell-fish,	
Woolen goods.....	5,630,946	etc.....	2,192,069
Metals.....	5,819,102		
EXPORTS.		EXPORTS.	
	Haikwan taels.		Haikwan taels.
Tea.....	23,504,320	Hides.....	996,247
Silk.....	23,384,848	Paper, tinfoil, etc.....	678,568
Sugar.....	1,638,408	Clothing.....	943,539
Straw braid.....	2,089,185		

During 1886 the principal countries participated in the trade with China as follows, the values being given in haikwan taels:

COUNTRIES.	Imports from—	Exports to—	Total trade.
Great Britain	22,084,753	19,745,694	41,780,447
Hong-Kong	84,889,671	22,552,676	57,442,347
India	16,980,085	531,601	17,511,686
United States	4,647,888	9,685,691	14,333,579
Continent of Europe (with- out Russia)	2,749,083	11,928,404	14,677,487
Japan	5,691,489	1,322,086	6,913,575
Russia (in Europe and Asia)	202,918	7,089,332	7,292,250

There were exported in 1886, 295,639,300 pounds of tea, of which 126,604,950 pounds went to Great Britain, 768,856 pounds to Russia, 40,591,750 pounds to the United States, 20,738,000 pounds to Hong-Kong, and 17,120,666 pounds to Australia.

The reports of the Imperial Maritime Customs for 1887 show an increase of 6,000 piculs in the imports of opium, the total being 73,877 piculs (1 picul=133½ pounds). This does not denote an increased consumption of Indian opium, but is probably due to placing the junk-trade between the Continent and the ports of Hong-Kong and Macao, from which smuggling was formerly encouraged, under the control of the Chinese customs authorities by an arrangement with the British and Portuguese governments. In 1887 the system of paying a fixed duty to the customs authorities in lieu of *likin* and of admitting opium in bond first went into operation. The sum collected as prepaid *likin* duties by the customs department was for the year 4,645,848 taels. In spite of the opium convention, the use of Indian opium is steadily growing less. Only the wealthy or old people, unaccustomed to the flavor of the native-grown drug, will pay the higher price of Patna opium. The difference of quality is disappearing with the introduction of improved methods of cultivation, and already opium is grown in Honan that is almost as good as that of Patna, and costs \$40 less per picul. Practically all the prepared opium contains a considerable admixture of the Chinese product.

The Chinese have taken largely to importing cotton-yarn instead of the finished goods. The yarn-trade has increased from 108,360 piculs in 1878 to 523,114 piculs in 1887, the value being 12,547,653 taels, or more than one third of the entire value of the cotton goods imported. The yarn of Bombay is preferred to that of Manchester. The imports of iron and steel have fallen off, and the import of kerosene-oil shows a remarkable decrease—from 28,088,101 gallons in 1886 to 12,015,135 gallons in 1887, which is probably due to the discouragement of its use by the authorities because of the many fires it has caused. The export of silk in 1887 was 56,000 piculs, or about the same quantity as in the preceding year, with an increase of five per cent. in prices. The exports of silk-cocoons and manufactured silks were greater than in 1886. The exports of straw braid, which is the staple of the trade of Tientsin and Chefoo,

have increased from 25,930 piculs in 1877 to 150,952 piculs, valued at about \$4,500,000 in 1887. The tea-trade has suffered from the competition of the Indian product, which is sold for a third less in the London market. The Chinese Government in 1887 asked the opinion of the Foochow Chamber of Commerce as to the cause of the decadence of the tea-trade. The report represents that the tea-growers have grown negligent in their methods of cultivation, no longer ditching or manuring or pruning or planting new shrubs, and that they strip the leaves four or five times a year, instead of three times, as formerly. The leaves are full of dust and stalks, and are too dry to admit of sufficient firing. The sophistication and adulteration practiced by the tea-guilds lowers the quality of the product still further. The dust and stalks have caused the markets of the Continent of Europe to slip away, and now Australia and Canada prefer the more carefully cultivated teas of Ceylon. The decline of the tea-trade in 1886, which caused the alarm of the Government, became more marked in 1887, the quantity diminishing 5 per cent., while there was a fall in value of 12 per cent.

Navigation.—During 1886, 28,244 vessels, of 21,755,460 tons, were entered and cleared at Chinese ports, of which 23,262 were steamers, of 20,619,615 tons. Of the total number, 16,193, of 14,006,720 tons, were British; 7,852, of 5,874,821 tons, Chinese; 2,702, of 1,499,296 tons, German; 413, of 143,799 tons, American; 380, of 270,002 tons, Japanese; and 123, of 158,400 tons, French.

The tonnage of 1887 was 22,199,661, the largest ever known. Of this, 14,171,810 tons, or about two thirds, were British; 5,670,123 tons, or one fourth, Chinese; 1,480,083 tons, or one sixteenth, German; 306,169 tons were Japanese; 130,890 tons were French; and 66,539 tons were American.

Railroads and Telegraphs.—A small railway from Tongsan, at the Kai-ping mines, to Yung-chong, in the province of Chihli, was originally built for the conveyance of coal. It has obtained a considerable passenger-traffic also, declared a 6-per-cent. dividend on its paid-up capital for 1887, and in 1888 was extended to Tientsin. Another railroad extending from Kai-ping to Petang is in course of construction. In 1884 there were 3,089 miles of telegraph lines and 5,482 miles of wire in operation.

Navigation of the Upper Yangtse.—The English inserted in the treaty relative to the open ports a clause opening Chung-King also to foreign trade as soon as steamers could be made to ascend so far. The last open port on the Yangtse Kiang at present is Ichang, 1,000 miles from the sea. Chung-King, the commercial emporium of the wealthy province of Szechuen, which has a population of 70,000,000, is 500 miles higher, while between them is a series of rapids, where the river passes through a narrow, rocky chasm.

Junks are dragged by men up-stream along the bank, and descend by shooting the rapids. An Englishman named Archibald Little formed a company and built a steamer of special design. When he was ready to make the experimental trip, he applied for permission through the British minister. The Imperial Government advised with the chief provincial officials, who raised objections, both real and fanciful, and pleaded at least for delay, which was granted. Aside from the danger of collision with junks when the steamer is working its way up the swift current, there was a probability that the boating population of Chung-King would attack the steamer and crew in order to discourage the competition of a line of steamboats.

Trade Regulations.—The English Government in the late opium convention obtained the consent of the Government of Peking to a provision admitting opium free to all parts of the empire without its being subjected to transit dues on the payment of 80 taels a chest at the port of entry in addition to the customs duty. This drug is now the only commodity that circulates throughout China free from the *likin* taxes that are levied by the local authorities on goods passing by road, river, or canal through their several jurisdictions. The *likin* was originally a war tax imposed by the provinces to raise means for the purpose of suppressing the Taiping rebellion. The stations are so near together that the price of goods carried far into the interior is many times enhanced, and transportation is delayed to a corresponding extent. Native traders, who compound the taxes with corrupt officials, have an advantage over foreigners. A clause in the opium convention provides for the commutation of the *likin* tax by the payment to the imperial revenue officers of a tax equal to half of the duty. This secures a transit pass that carries goods through all the *likin* barriers to the place of destination. The British merchants, on securing this concession, were confident of being able to compete successfully with the French in the provinces of Yunnan, Quangsi, and Quangtung. According to the report of the British consul at Pakhoi, however, it has proved illusive as a means of stimulating trade, because, when the goods reach the declared market they are subjected there to a tax approximating the sum of the *likin* taxes they would otherwise have to pay. The Provincial Government at Canton argues that there are no treaty restrictions against taxing Chinese and property in their possession. The principle here involved was a subject of discussion in connection with the trade of the treaty ports, until it was settled by the Chefoo Convention that the local authorities have a right to impose *likin* in the open ports outside the limits of the foreign settlements.

The Chinese Government has decided to introduce the system of bonded warehouses. A beginning was made in Shanghai on Jan. 1, 1868. The privilege of warehousing bonded

goods was restricted to the China Merchants' Steam Navigation Company, a corporation composed entirely of mandarins and other Chinese. The British merchants of Shanghai raised an outcry against this arrangement, and blamed their Government for not interfering to obtain for them a share in the privilege. They charged the German minister, Herr von Brandt, with bringing about the monopoly for the purpose of injuring them, and declared that the warehouses having the right of storing goods in bond would gain all other business, and that the rows of warehouses and miles of wharves that they had constructed would be deserted. Herr von Brandt explained that the Chinese Government wished to test the system before establishing it permanently, and therefore restricted it to the wharves of the native company, and would not listen to a proposition to admit all warehouses that offered sufficient guarantees.

The Condition of Chinese Abroad.—In August, 1886, three high officials were sent abroad as an imperial commission to inquire into the treatment and condition of Chinese emigrants in foreign countries. They first visited Manila, in the Philippine Islands, where the Chinese complained bitterly of the wrongs they received at the hands of the Spaniards, and begged for the appointment of consular agents to protect them. Although they are plundered with impunity by lawless individuals and subjected to extortionate taxes by the authorities, yet their community of 50,000 souls is thriving. At Singapore the Chinese number 150,000, and are the richest of all the inhabitants, owning four fifths of the land and much commercial capital. The British Government has recently consented to the appointment of a Chinese consul, but he has no jurisdiction over the laborers passing through the port in great numbers. These are looked after by a British registrar-general, who does not prevent the perpetration of gross frauds by the labor companies. In Malacca and Penang they found the Chinese prosperous in business. There are 100,000 Chinamen in Perak and Selangore, mostly engaged in mining tin, several of whom are millionaires. The 80,000 Chinese residents in Rangoon are many of them merchants dealing in rice and in precious stones. In Sumatra there are large numbers of Chinese laborers employed on the tobacco plantations. Those who are saving do well, but the majority are addicted to gambling, and in this they are encouraged by the overseers, who keep those who fall in debt at work beyond the legal term, because they are ignorant of their right to return home at the end of three years. The Dutch authorities promised to have this righted. In Batavia the Chinese are heavily taxed, and gambling is common. In other Dutch colonies, containing more than 200,000 Chinese immigrants, they are treated "most outrageously" by the authorities. In Australia, the Chinese, who, on landing, are subjected to a tax of from

£10 to £30, prayed that measures for their protection might be taken. The commissioners reported that there were several millions of Chinamen doing business as merchants or working as laborers in foreign countries. In some ports emigration is increasing, and the Chinese merchants are thriving. Their prosperity has excited the jealousy of the peoples among which they dwell, and caused hostile measures to be adopted by foreign governments. The Dutch authorities have been endeavoring to expel them from their colonies, and collisions between the Chinese and natives are of frequent occurrence. If steps are not taken to render the residence of the Chinese abroad more secure and peaceful, the commissioners fear that they will all flock home. They view with dread the prospect of this sudden influx of population in the overcrowded districts of the sea-coast. After placing their report in the hands of Chan Ohih-tung, the Viceroy of Canton, they set out, in September, 1887, on a journey to Borneo to study the condition of their countrymen in British North Borneo, Sarawak, and the Dutch possessions. The viceroy, in forwarding their report to Peking, accompanied it with a memorial in which he recommended the appointment of consuls to look after the interests of Chinese subjects in foreign lands. He suggested that consuls-general should be maintained in Manila, in some of the Dutch colonies, in Sydney, and in Singapore. So important did he consider the matter of appointing a consul-general to Manila that he obtained the consent of the Government of Madrid, but this was withdrawn when the colonial authorities objected. The treaties of 1857, that give European governments the right to maintain consuls in China, do not accord reciprocal rights to the Chinese Government. The omission is simply due to the heedlessness of the Chinese negotiators, who had no thought when the instruments were drawn up that China would ever want to send officials abroad. The number of Chinese emigrants who sailed from Hong-Kong during 1887 was 82,897, being 18,000 more than in the previous year. About half of the increase was due to a larger emigration to the Straits Settlements, while 5,000 more emigrants than in 1886 were destined for the United States, and 3,500 more for the Australian colonies.

Inundation in Honan.—One of the periodical floods that have caused the Hoang-Ho, or Yellow river to be known as "China's Sorrow," occurred in the autumn of 1887. This river, rising in the mountains of Thibet, and descending with great rapidity from the Mongolian plateau, washing down great quantities of the loose, fine, yellow earth called loess, has changed its course in the flat coast region nine times within the historical period. In 1852, having for five hundred years poured its great volume of water into the Yellow Sea south of the promontory of Shantung, it burst its northern bank near Kaifeng-fu, the capital of the

province of Honan, where it enters the great eastern plain, and cut a new bed through the northern part of Shantung into the Gulf of Pechili. In 1887 this process was reversed. After an unusually rainy September the stream broke through the southern embankment at Cheng-chow, forty miles above Kaifeng-fu, on the 28th of that month. Where the first breach occurred 5,000 men, who were strengthening the levee, were drowned, and at another spot nearly 4,000 laborers were swept away. The bed of the river was several feet above the surface of the land. When the gap attained a breadth of 1,200 yards, the river deserted its bed. The overflow confined itself at first to the channel of the Lu-Chia river, but soon flooded the Chungnou district, destroying 100 villages and inundating the lands of 800 more. Several of the suburbs of the great commercial city of Chusien-Chen were swept away, and the elevated situation of the main town alone saved it from destruction. The flood spread over a low, thickly populated district, beginning 70 miles south of Kaifeng-fu, submerging 1,500 villages, and when it reached the valley of the Huai-Ho, the destruction of life and property was still greater. Many walled cities were depopulated and virtually destroyed. There were between one and two millions of persons drowned, and some say as many as seven millions. The most careful estimate makes the number of those who lost their lives 1,600,000, and of those who were left homeless and destitute 5,000,000. Millions of those left without shelter or means of life, perished of famine and cold. The Emperor and Empress contributed largely from their private fortunes to relieve the distress, and the Government did everything within its power, beginning by ordering 32,000,000 pounds of rice from Central China destined for Peking, to be taken at once to the inundated district. The guilds co-operated with the mandarins in distributing relief. The river, if left to itself, would probably have formed a channel very nearly along its ancient bed. The Government ordered the breach to be closed as soon as the waters subsided, appropriating \$2,500,000 for the purpose. When the work was begun in the spring the people of Honan destroyed material that was sent to mend the dikes, because they wished to have the river run in its new bed, and not return to their province. The soldiers and workmen who were sent to stay the progress of the flood or to repair the damage were sometimes surprised by a fresh overflow, and in one instance nearly 5,000 soldiers were drowned together. The waters of the river spread over a district 7,500 square miles in extent in a series of lakes. The cities of Chin-chow, Wei-shi, Tsung-mow, Yen-lin, Fu-kao, Shiva, Cheng-chow, Taikang, Taiping, and Ying-chow were submerged, and all but the northern part of Chow-kia-kow. The waters found an outlet through the Huai-Ho into the Hongtze Lake, flooding a wide dis-

trict in the province of Nganwhei, and a part of the overflow reached the sea, six months after the first catastrophe, a long distance south of the ancient mouth of the Hoang-Ho, while the main volume entered the Great Canal near the Hongtsze Lake, and flowed through it into the Yangtze Kiang. When all efforts that were made in the winter to stop the breach proved useless, the Government set a force of 60,000 men at work to dig a deep canal for the purpose of tapping the river above Chengchow, and leading it into its regular channel at a point below the gap. The barriers that were interposed to confine the river to its bed at Chengchow were all swept away by the midsummer freshet caused by melting snows. After the expenditure of over \$10,000,000 with no satisfactory result, the Emperor degraded the two high officials who had charge of the work of restoration, and sent them to Manchuria to work on the military roads. There were damaging floods in the province of Manchuria in the autumn of 1898. Moukden, the capital, was inundated, and all the crops in the neighboring district were destroyed. Extending over the country, the floods caused wide-spread misery, and at last reached the port of Newchang, where the foreign quarter was submerged.

Earthquake in Yunnan.—A destructive earthquake visited the province of Yunnan late in December, 1887, laying the capital and other towns in ruins. The shocks lasted four days. There were 5,000 persons killed by the falling of houses in the capital district. At Lainon the destruction was almost as great. Farther north, at Lo-chan, 10,000 persons lost their lives, and the aspect of the country was changed by the sinking of tracts of land and the formation of lakes in their place.

CITIES, AMERICAN, RECENT GROWTH OF.
Anniston, a city of Calhoun County, Alabama, in the northeastern part of the State, on the main line of the East Tennessee, Virginia, and Georgia Railroad, at the crossing of the Georgia Pacific, 60 miles from Birmingham, and 100 from Atlanta, Ga. It has a population of 12,000, which is twice what it had one year ago. It lies in the heart of the great iron region of the South. The ore is mined in open cut, without tunneling or underground delving, and the supply seems inexhaustible. A hill, or rather mountain-side, of iron within the corporate limits of the town has been dug from for upward of ten years, with scarcely perceptible results. The hills that surround the town are largely of iron-ore. The Coosa and Cahaba coal-fields, affording the best of coking-coal, are within 25 and 45 miles, and vast forests supply timber at convenient distance. Limestone abounds. There was a furnace here during the civil war to supply iron to the Confederate Government; but it was destroyed by the national troops in 1865. The site, with the main deposits of iron-ore, was purchased by a private citizen eighteen years ago, and in

1872 the Woodstock Iron Company was organized, owning more than 40,000 acres. Messrs. Noble and Tyler were at its head, and the town is named for Mrs. Tyler, "Annie's Town." Prior to 1883 no land was sold. The city was surveyed and laid out, drainage-system perfected, streets macadamized, buildings, churches, stores, and school-houses erected, and railroad connections secured, entailing not one dollar of debt upon the inhabitants, who numbered at that date 4,000. It is lighted by electricity and gas, and has two daily papers, and five miles of street-railway. It is 800 feet above sea-level, and one of the highest points accessible to railroads in the State. Pure water is supplied by an artesian well, forced to a reservoir one mile distant at an elevation of 236 feet. A pressure of 100 pounds to the inch renders fire-hydrants sufficient, without steam-engines. Four hundred houses were completed within the first six months of 1888. Anniston owns 30,000 acres of coal-land, and 75,000 acres of brown and red hematite iron-ore. Its capital is upward of \$10,000,000—more than that of the whole State in 1880. It employs 6,000 workmen, to whom \$60,000 are paid, weekly, in wages. Four charcoal-furnaces are in operation, with an annual capacity of 50,000 tons of car-iron. Two of these were built in 1873 and 1879, and have never known a cold day except for repairs. Two coke-furnaces, to have an annual capacity of 100,000 tons of pig-iron each, are being completed this year. The largest pipe-works in the United States, with a daily output of 200 tons of finished pipe, are in course of construction. The United States Rolling Stock Company has a plant of \$1,000,000 in Anniston, having purchased the car and car-wheel works and car-axle forge of the town. The daily capacity is twenty-five cars. Anniston has the only steel-blomary in the South, and the largest cotton-mill in the State, producing 115,000 yards a week of sheetings and shirtings. Goods have this year been exported to Shanghai, China. There is a cotton-compress with a daily capacity of 1,000 bales. There are two foundries, a rolling-mill, machine-shops, boiler and sheet-iron works, planing-mills, and fire-brick works, a horse-shoe manufacturing company, and factories of stoves, agricultural implements, and ice. There are four railroads, two of which are operated and owned by the citizens, viz.: The Anniston and Atlantic, connecting with the Georgia Central at Sylacanga, and the Anniston and Cincinnati, connecting with the Cincinnati Great Southern at Atalla. The latter has been completed this year, and cost \$1,000,000. The yearly tonnage of the three railroads, in full operation, is 118,765 gross tons. Competitive freight rates are the right of Anniston by location. New Orleans is 14 hours distant; Cincinnati, 17; Washington, 26. There are three banks, one National, capital and surplus \$300,000; one State, and one savings, capital of each, \$100,000. There are churches of all

denominations, and a new school-building, An-niston being a separate school-district. Two pay-schools, for boys and girls, stone structures, are the gift to the town of Mr. Noble.

Birmingham, a city of Jefferson County, Ala., 50 miles north of the center of the State, 100 miles from Montgomery, 849 miles from New Orleans, and 1,017 miles from New York. It was founded in 1871 by the Elyton Land Company, owning 4,150 acres, with capital of \$200,000. Its altitude above sea-level is 602 feet. The population in 1880 was 4,500; in 1885, 21,847; in 1886, 30,000; in October, 1887, 41,725; in October, 1888, it was estimated at 50,000. About 40 per cent. are colored. Surrounding villages, sustained by the city, make the population of the district between 65,000 and 70,000. The taxable valuation of property in 1881 was \$2,953,375.37; in 1887, \$33,019,485; increase in the county during the same period, over \$26,000,000. The sales of the Land Company for the year 1885-'86 were \$2,250,000; for the first three weeks in August, 1887, \$1,000,000. The debt of the city is \$355,000. Iron is the prominent industry. Ore is supplied by Red mountain, six miles distant, estimated to contain 500,000,000,000 tons. The thickness of beds on an average is 22 feet, and the impurities are of lime, assisting fluxing. Limestone lies in the valley. Coal is also distant six miles, in the Warrior field, the largest in the State. One million tons of coke are required yearly by the district. The cost of manufacturing pig-iron is \$9 a ton. There are 21 furnaces, the first of which, within corporate limits, went into blast in 1880. The daily output is 2,078 tons. Six trunk railroads enter the city, which has a Union passenger depot, and others are in course of construction. There are numerous branch, belt, and short mineral roads. Competitive rates lower the cost of transportation. There are 66 miles of street-railway, in horse-car and dummy lines, electric-lights and gas-works, 4 daily and 11 weekly newspapers, and 37 churches. There are 11 banks, possessing aggregate capital, surplus, and undivided profit of \$2,750,000, with deposits amounting to \$2,500,000. Education is under the control of a board of commissioners. There are 34 public schools in 8 buildings, a college, an academy, and numerous private schools. The drainage is not completed; but the Waring system has been adopted, and from seven to eight miles of sewers are constructed yearly. The water-supply is also insufficient; \$500,000 have been appropriated for enlargement of works, and it is proposed to tunnel Red mountain to the Cahaba river, eight miles distant. An abundant supply will result, with pressure almost sufficient to dispense with fire-engines. An appropriation of \$300,000 for a Government edifice has been recently made by Congress. The manufactures, which are shipped throughout the United States and to Canada and Mexico, and exported to Europe,

are of iron, steel, and wood, lumber being derived from virgin forests. In addition to the larger industries—iron-works, foundries, machine and car shops, rolling and planing mills, etc.—are bridge and bolt, iron-roofing, tool, tack, furniture, stove, soap, carriage and wagon, and clothing factories, brick and fire-brick works, breweries, steam-bottling works, and a cotton-compress. The total number of employes is 22,010; yearly wages and salaries, \$10,010,892. The annual volume of business is \$56,000,000. Convict labor is employed in the mines. The climate is healthful. There are three summer-resorts and seventeen hotels.

Bowling Green, the county-seat of Wood County, Ohio, in the great northwestern Ohio natural-gas and oil field, 20 miles south of Toledo, on the Toledo, Columbus, and Southern Railway. The population in 1885 was 2,000; at present it is 4,000. Gas was found in 1885, and 21 wells have been drilled, averaging in depth 1,100 feet, and varying in flow from 1,000,000 to 5,000,000 cubic feet a day. The formation is: Drift, 10 feet; limestones, 400; shales, 680; Trenton, 20. As a rule, gas is found in the Trenton rock at a depth of 10 feet, the volume being determined by the porosity. About 40 wells are scattered over Wood County, yielding, at a low estimate, 160,000,000 cubic feet daily. The field is divided, Bowling Green occupying the center of the larger area. Oil was discovered in 1886. The county owns 104 wells, producing daily 10,400 barrels; and 9 miles from the city, at Cygnet, is the tank-farm, of 50 tanks, holding 85,000 barrels each, from which oil is pumped to refineries distant 45 miles. The capacity of the pipe-line is 8,000 barrels daily, and extensions to Chicago and Toledo are proposed. The depth of the wells is from 1,175 to 2,000 feet, and from 35 to 50 feet in the Trenton sandstone. The pool is estimated to contain 60 square miles, and 100,000 acres of land in the county are under lease for gas and oil purposes. The town is on a limestone ridge, and lime, burned by gas in four patent kilns, is sold below competition by that made with coal and wood fuel. Glass-sand abounds, and there are four glass-factories, employing 500 hands. The quality of the glass, it is claimed, is improved by gas-burning. There are 2 planing-mills, and a rolling-mill is being constructed. Incubators, also, are heated by gas. There are 5 newspapers (1 in the German language), 2 banks (both private), with aggregate deposits of \$300,000; total capital, surplus, and deposits, over \$1,000,000. Four hundred residences and several business blocks were constructed in 1887. Water-works are projected, costing from \$50,000 to \$75,000. The drainage is good, and the streets are wide. Two railroad lines secure outlets to the Great Lakes and trunk lines, and competing rates reduce freight. Additional facilities will be added by a branch road that has been surveyed through the town. The county fair-ground

covers 57 acres. The surrounding farms are of rich, black soil, needing no fertilizing.

Calgary, an incorporated city of 2,500 inhabitants, in the province of Alberta, Canada. It is near the confluence of the Bow and Elbow rivers, within sight of the Rocky Mountains, and just outside of their eastern foot-hills. It is nearly north of Fort Benton, Montana, distant from that point about 200 miles, and has an altitude of 3,388 feet above the sea. This is the point where the Canadian Pacific Railway enters the Rocky Mountains, and it is the center of a vast cattle and sheep grazing region, of which Calgary is the supplying point and headquarters. The city is well built, the excellent stone of the neighborhood being largely employed in its structures. Several handsome churches and commodious school-houses have been erected, and the appearance of the town is far in advance of what would be expected of its recent origin and rapid growth. A public water-system, good drainage, electric street-lighting, police and fire departments, and other modern appurtenances of city organization, testify to its alertness. The banks are especially noteworthy for their strength and business facilities. This is one of the headquarters of the mounted police, and a center of Indian trading; there are also Dominion and railway land-agencies here. A railway is about to be built north and south from Calgary, to connect it with the coal region of Lethbridge, the ranching country around Edmonton, and other districts now reached by stages. The surrounding region is rapidly undergoing development, by means of irrigation, in grazing and farming industries, while new mines are constantly opening in the mountains. All this is of advantage to Calgary, which has the same situation relative to the mountain border of Canada that Denver has in relation to Colorado.

Canton, Stark County, Ohio, 60 miles from Cleveland. The population in 1870 was 8,660; in 1880, 12,258; in 1888, estimated at 30,000. Manufactures are the prominent interest, and include: Mowers and reapers, thrashing-machines, farm implements, safes, hay-racks, hay-tedders, sulky and hand plows, reaper-knives and sections, steel cutlery, saddlery, hardware, feed-cutters, horse-powers, mining and milling machinery, street-lamps, glass, iron bridges, springs, saws, iron roofing, hay-carriers, castings, stoves, steam-boilers and engines, stone-ware, brick, flour, carriages, wooden articles, printing-presses, drilling-machines, tin and wooden pumps, doors, blinds and sash, feed-mills, flouring machinery, bells, lawn-rakes, post-hole diggers, house furniture, carpets, glass oil-tanks, hay-forks, bee-hives, paper boxes, faucets, surgical chairs, toilet and laundry soaps, brooms, woolen goods and yarns, blank-books, baking-powder, mattresses, extension ladders, hardware, novelties, files, revolving book and dry-goods cases, roasted coffees, watches, watch-cases, and railway sig-

nals. The capital invested is \$10,000,000, and the yearly products amount to \$13,000,000. Six thousand workmen are employed. The machinery manufactured is shipped to Europe, North and South America, Australia, and elsewhere. The Buckeye Works—capital, \$1,500,000—employ 900 hands, and have a capacity of 15,000 harvesting-machines and 2,000 thrashers. Four mills consume daily 2,500 bushels of wheat. The county is, save one, the largest producer of wheat in the State, averaging yearly 1,286,410 bushels. Coal-fields underlie it. Forty large mines are worked, with a daily output of 6,000 tons, some of which are within a mile of the city. Two hundred others are operated by farmers. Cheap fuel and free sites for factories induce location. Clay for pottery, sewer-pipes, and brick abounds, with building and limestone and black-band ore. There are 5 railroads, with unlimited connections. Canton is lighted by gas, electricity, and gasoline. There are 3 daily newspapers (one in German), 6 banks (of which two are National), a street-railroad system, and a dummy-line of two miles, water-works of the Holly system, owned by the city, so that no tax is paid for water, and a drainage system of storm-water sewerage. There are 17 churches, a central high-school costing \$99,600, 7 ward and 4 relief public-school buildings, and 2 parochial schools, 1 opera-house, 6 modern hotels, a public library, 2 tabernacles, public halls, a paid fire department, with electric-alarm system, telegraph facilities, and telephone communication to a distance of 75 miles. It has a free mail-delivery. The summer-resorts are numerous. There is a new post-office building and an Odd Fellows Hall. A United States Signal Service station is located here.

Chattanooga, Hamilton County, Tenn., at the foot of Lookout mountain, on Tennessee river, six miles from the southern boundary of the State. Chattanooga was founded in 1836, and first known as Ross's Landing, from the name of the Cherokee chief. It was incorporated in 1852. The population in 1860 was 2,545; in 1870, 6,091; in 1880, 12,879; in 1887, 36,908; and in 1888 it is estimated at 50,000. During the civil war it was an important strategic point, and a famous battle was fought near it. Thirteen thousand National soldiers are buried in the cemetery. Chattanooga is on the great natural highway-through the mountains, and was the focus of interstate wagon-roads in days gone by. It is 195 miles above Mussel Shoals, and on the completion of engineering works at that point, will possess valuable facilities for river transportation. It is only thirty-four miles farther from the Gulf by water than Cincinnati. The iron industry has progressed for twelve years. Four furnaces are in blast within the city limits, and it is the financial distributing-point for a dozen more in the district. The coal-mining plants, from which the supplies of fuel are drawn, number twenty-two, with a total output in 1886 of

1,200,000 gross tons. It is the first point in the South where the manufacture of Bessemer steel was attempted. The daily capacity of the Roane works is 250 tons of rails of this steel. Nine lines of railroad enter Chattanooga, formed by four trunk, and one independent system. There is also a narrow-gauge line to the top of Lookout Mountain, costing \$150,000; an incline to that point, costing \$75,000; and another to Mission Ridge, costing \$25,000. A belt road of 30 miles runs 128 passenger and 500 freight cars daily. Truck-farming is a profitable industry. During the year 80,000,000 feet of lumber, 1,000,000 bushels of grain, 200,000 tons of iron-ore, and from 5,000 to 10,000 bales of cotton, with farm produce, are floated to the city from upper points. There are three daily and six weekly newspapers, electric and gas light companies, water-works, five banks (three of which are National), with total capital, surplus, etc., of \$1,860,000, a public school attendance of 6,000, in addition to numerous private schools, and two universities. The sewerage system has cost \$150,000. There are twenty miles of street-railway, and an electric line is building. The city contains an opera house and twelve hotels. The tax-valuation in 1880 was \$3,294,992; in 1885, \$6,480,960; in 1888, \$12,823,000. The sales of real estate during the year 1886 were \$3,028,125; in 1887, \$13,264,505. The city debt is \$206,000. The manufacturing establishments in 1885 numbered 99. At present there are 152, 132 of which employ steam-power. The capital invested is \$8,711,700; hands employed, 8,432; yearly wages, \$3,332,900; products, \$10,655,000. There are eight foundries and machine-shops, as many factories of agricultural implements, two cotton-compresses, two steam-boiler shops, three rolling-mills, ten planing and eight saw mills, two stove works, two large tanneries, extensive pipe works, six brass and seven brick works, factories of springs, carriages and wagons, scales, boxes, tacks, soap, candy, cane mills, wire nails, cigars, furniture, fertilizers, galvanized and architectural iron, artificial stone, powder, dynamite, and many small industries. Chattanooga has twenty-five churches, independent of those of the colored population. Many of these are handsome buildings. The post-office and customs house is a fine edifice. Chattanooga is a United States Signal Service station.

Cheyenne, a city, capital of Wyoming Territory and county-seat of Laramie County. Cheyenne was first settled in 1867; its population, as given by the census returns of 1880, was 3,456; but in 1887 it was estimated at 10,000. It lies at the base of the Rocky Mountains, about forty miles from the western line of Nebraska, and about twelve miles north of Colorado, and is on the line of the Union Pacific Railway, 516 miles west of Omaha, and at the junction of the Denver Pacific, Colorado Central, and Cheyenne and Northern railways. It is proposed to extend the last road as far north

as the line of the British possessions. Another road soon to be completed, the Cheyenne and Burlington, a branch of the Burlington and Missouri system, will add another to the city's facilities for communication. The assessed valuation of real estate in 1886 was \$2,208,457; the total amount of real and personal property was \$2,675,000. It is understood that the assessment-roll represents only about one third of the actual value of the property. In 1887 there was an increase of about half a million dollars, the amounts aggregating \$3,258,000. A large portion of the personal property in the city and county consists of live-stock, the principal source of wealth; in 1886 this interest in the county was assessed at a value of \$4,481,194. Cheyenne is, moreover, the supply-point for a great stock-raising territory, many of the largest owners of ranches having their homes in the city. The manufactures, though a secondary interest, are increasing. There are two saddle and harness establishments, a carriage and wagon factory, a planing-mill and wood-work factory, two book-binders, two breweries, and two cigar-factories. The total value of manufactures for 1886 was about \$500,000. The Union Pacific Railway employs several hundred men in its machine and car-repairing shops. The Cheyenne and Burlington is also to have a shop there very soon. The tax-levy for 1887 was eight and three fourth mills, divided as follows: general revenue, five and a half mills; streets and alleys, one and one quarter mill; bonds of 1875, one half mill; bonds of 1882, one mill; bonds of 1884, one half mill. The water-works, owned by the city, were constructed at a cost of about \$150,000. The source of supply is 127 feet higher than the city, and the gravitation affords sufficient force for all domestic and manufacturing purposes. The water comes from Crow Creek, the source of supply to Lakes Absaracca and Mahpealutah, the city owning 160 acres of land, controlling one mile of water on Crow Creek, 480 acres partly covered by Lake Mahpealutah, and 160 partly covered by Lake Absaracca. The system includes sixty fire-hydrants and steam-pumping machinery, on the line of the main pipe, for extinguishment of fires. It is estimated that with an increase of storage-basins the present system would supply a population of 50,000. The city has the best modern system of sewerage, an alarm-system fire department; telephone communication, gas and electric lighting, and a street-railway. By act of the Legislature of 1886, an appropriation of \$150,000 was made for a Territorial Capitol to be completed in two years. There are five banks with capital aggregating more than \$1,000,000, and average deposits of over \$3,000,000. Three daily and three weekly newspapers are issued. The Union Pacific Railway has built here one of its finest depots, at an expense of over \$100,000, and that of the Cheyenne and Burlington was erected at a

cost of about \$90,000. Other noteworthy buildings are 8 churches, 4 public schools with property valued at \$75,000; a convent school that cost \$50,000; a county hospital, \$35,000; an opera-house, \$40,000; and a club-house, \$30,000. The Young Men's Christian Association has a membership of about 800, and an income of more than \$3,000. It has a fine hall, a gymnasium, and a free reading-room. The county library, containing nearly 2,000 volumes, is open to the public. Three-quarters of a mile northwest of the city are the grounds of the Territorial Fair Association, containing 80 acres of land, and furnished with suitable buildings and a fine race-track. Fort Russell three miles west, has recently been enlarged at a cost of \$150,000, and is a permanent military post, the largest in the department of the Platte. Twenty miles northwest of the city is the Silver Crown Mining District, the development of which was begun in 1886. Several mines are now in operation that will yield over fifty dollars to the ton. A smelter having a capacity of thirty tons a day has been erected there, and a concentrator, and about one hundred men are engaged in the mines. Several of the mines are more than one hundred feet deep, and it is the opinion of mineralogists who have looked into the matter that richer gold and silver ore will be reached at a greater depth.

Council Bluffs, the largest and oldest town in western Iowa, with a population of 85,000. Council Bluffs (a name given by the Indians), began as an Indian trading-post, and then became a settlement of the Mormons after they removed from Nauvoo, Ill., in 1846. When the California gold discoveries sent emigration westward this place became one of the main starting-points for overland travel. It is at the foot of and upon the bluffs forming the eastern margin of the bottom-lands bordering the Missouri, and is connected with Omaha, Neb., immediately opposite, by a railway-bridge, and a wagon-bridge across which street-cars will presently be run by electric motors. The business and a large part of the best residence part of the town is upon the level expanse at the foot of the bluffs; but many fine streets run into the beautiful ravines that indent the highlands; and upon their wooded crest is an extensive public park, the cemeteries, and the reservoir of the water-system, supplied by pumping (through settling-basins) from Missouri river. The city hall and court-house, the Federal building, and the high-school, are stately edifices. Just outside of town is a State institution for the instruction and care of deaf-mutes which has 375 pupils. The city is well paved, sewered, and policed. It is lighted with gas, but the incandescent system of electric lighting is extensively used. There are some exceedingly handsome churches and society halls, and a public library of 7,500 volumes is well patronized. There are three daily newspapers and several weeklies. As a railway

focus, Council Bluffs has long been eminent. This is the eastern terminus of the Union Pacific system, and a western terminus of the Northwestern, Burlington, Milwaukee and St. Paul, Rock Island, Wabash, and Illinois Central systems, from Chicago, while other railways lead north to Sioux City and St. Paul, and south to the cities along Missouri river. All this centers in one great station. These railway facilities make the city a flourishing business point, the wholesale and jobbing trade amounting in 1887 to \$33,000,000, of which one third was in agricultural implements alone—an item in which Council Bluffs is exceeded only by Kansas City. Manufacturing is not so forward, the combined products amounting to \$4,000,000 a year. Several railroads have extensive repair-shops here, and one corn-cannery employs 400 men. Wagons and carriages form another leading object of manufacture. The public schools are well managed and numerous, and the Roman Catholic Church supports two academies; but there are no special institutions of higher learning. The healthfulness of the town is high, and many persons doing business in Omaha prefer to make their residence here. A few miles below the city a lake-like lagoon from the Missouri forms a summer pleasure-place, where hotels have been built, and boating and fishing attract excursionists.

Decatur, Morgan County, Ala., 25 miles from the northern boundary, on Tennessee river, at intersection of the East Tennessee, Virginia and Georgia and the Louisville and Nashville railroads. It is on the water-shed between the Gulf of Mexico and Ohio river, has an altitude of 600 feet, and enjoys all advantages of the valley of the Tennessee. It is in the cereal belt, producing grains, blue grass, clover, etc., a cotton region, and tobacco-growing country, and the mineral resources are also unlimited, including coal and iron in close proximity, while timber of best quality abounds. Limestone, asphalt, building-stone, granite and marble, manganese, glass-sand, and brick-clay are available. The town was devastated during the civil war. On Jan. 11, 1887—the date of organization of the Land Improvement and Furnace Company with 5,600 acres of town, 50,000 acres of mineral lands, and \$400,000 capital—it contained fewer than 1,500 inhabitants. In one year, \$900,000 had been expended in improvements, including industries; and the population in July, 1888, was 7,500. It has a street-railway, an electric-light and telephone company, 1 daily and 3 weekly newspapers, a water-works system costing \$200,000, and 2 banks (one National), with capital of \$100,000 each. It was surveyed by a landscape engineer, and the sewerage is of the Waring system. Freight rates are competitive. Other railroad lines, in addition to the two trunk systems, are projected and constructing. Navigation of the river is dependent on completion of the works at Mussel Shoals.

Handwritten notes: "x y z" and "1887".

The schools are private. Industries completed or begun include a 70-ton charcoal iron-furnace, costing \$100,000; a charcoal company's plant of \$120,000; a bridge and construction company, \$100,000; oak extract works, \$60,000; a horseshoe-nail factory, \$100,000; boiler and engine works, \$100,000; a \$1,000,000 plant of the United States Rolling Stock Company; car-construction and repair-shops, \$300,000; a car-wheel foundry, \$60,000; an ice factory, \$10,000; a cotton-compress, \$75,000; a furniture, sash, door, and blind factory, 6 brick-yards, large lumber-yards and mills, and an artificial stone company. The daily output of 3 band saws is 60,000 feet of lumber, and of 1 circular saw, 15,000, while 2,500,000 shingles are handled yearly by the latter company. A steamboat is owned and operated in the business. An opera-house and business blocks are building. Two thousand residences and cottages have been erected. The "Tavern" cost \$140,000.

Durham, Wake County, North Carolina, 25 miles from Raleigh, on the North Carolina Railroad; population, nearly 8,000. It owes its prosperity to a single world-famed industry. Prior to the civil war, tobacco was manufactured in one small factory, which fell into the hands of the National army, pending negotiations for surrender by Gen. Johnston, in 1865. Orders received for the product of this establishment, after the disbandment of the armies, gave an impetus of growth to the town, which now has business connections all over the world. The largest granulated smoking-tobacco factory in the world, with a capacity of 10,000,000 pounds yearly, is here. It has a larger payroll than any other manufacturing establishment in the State. Cigarettes are the specialty of another company, and 254,133,333 were shipped during 1886. The increase for the month of July over the same month for the year previous was 20,895,140. There are more than a dozen factories of tobacco and snuff. The tobacco-boxes are made here. A cotton-mill, of 8,568 spindles and 200 looms, produces 9,000 yards of cloth a day, the bulk of which is made into tobacco-bags. There is also a bobbin and shuttle mill, with a capacity of 90,000 pieces a week, for cotton, woolen, silk, jute, flax, and woolen mills. A tobacco-cure company makes three forms of medicaments, and a fertilizer company uses tobacco-dust as a basis. The sales of tobacco in a year from a single warehouse amounted to 8,880,000 pounds. The amount paid for stamps on tobacco, from the figures of the Internal-Revenue Office, in six years and nine months, was \$37,878,212.88. The streets are paved with stone, there are electric lights and water-works, eleven churches, two newspapers, and a graded-school building erected at a cost of \$6,500, which accommodates 500 pupils. There are also two female seminaries.

Eau Claire, a city, county-seat of Eau Claire County, Wis., at the confluence of Chippewa

and Eau Claire rivers. It is 321 miles northwest of Chicago, and 84 miles east of St. Paul. The population in 1880 was 10,118, according to the United States census; in 1885 it was 21,668, according to the State census; and it is now estimated at 25,000. The Chicago, St. Paul, Minneapolis and Omaha Railroad, the Chicago, Milwaukee and St. Paul Railroad, and the Wisconsin Central Line, with branches extending in various directions, including those of the pine, hard wood, and mineral regions of the north. The chief water-power is supplied by the dam across Chippewa river, giving eighteen feet head, while the dam on Eau Claire river supplies the linen and other mills. These rivers, spanned by ten bridges, are thickly lined with manufacturing establishments, including a dozen large saw-mills, a sash-and-door factory, a linen-mill, a furniture factory, a refrigerator factory, two foundries, and a factory of electrical machinery and appliances. The following statement exhibits the principal statistics for 1888: Assessed value of property, \$5,404,487.89; bonded debt, \$195,000; school census, 4,401; men employed in saw-mills, etc., 1,572; amount of lumber sawed, 182,000,000 feet; lath sawed, 62,000,000; shingles sawed, 82,000,000; paper made, 2,621,000 pounds; value of lumber, lath, and shingles, \$2,541,000; value of sash, doors, and blinds made, \$333,000; value of paper and pulp made, \$140,000. Eau Claire is one of the largest lumber manufacturing cities in the United States. It manufactures annually 300,000,000 feet of lumber. It has 25 miles of water-mains with 320 hydrants, 2 electric-light companies with circuits 41 miles long, an electric fire-alarm system, 4½ miles of street-railway, 3 public parks, a sewage system, paved streets, an opera-house built at a cost of \$60,000, with a seating capacity of 1,200, beautiful residences and churches, 2 daily newspapers, a female academy, a free public library, a fine race-track, and an agricultural exposition building. It has telephonic connections with all the neighboring towns. A noted characteristic of this climate is its pure, dry atmosphere, which is favorable to those afflicted with pulmonary troubles. The Chippewa is one of the largest rivers in the State, and its great valley, with its numerous streams, proffers an accessible supply of timber, consisting of maple, oak, birch, elm, hemlock, and bass-wood. For the encouragement of new manufacturing enterprises, a bonus of \$100 is offered for each operative who shall be regularly and steadily employed in any legitimate manufacturing enterprise. This policy, during this the first year of the experiment, has secured the establishment of four large enterprises in Eau Claire.

Ely, a town in northern Minnesota, organized in 1886 by the Ely Mining Company, population about 1,000. It contains the Oandler iron mine, which is in process of development to a width of 130 feet, length 1,000 feet, with

from one to eight feet of stripping. Over 800 men are employed, and 1,000 tons of ore are shipped daily on 50 cars each of 20 tons capacity. The ore, a hard hematite, assays 68 per cent. metallic iron, and is low in phosphorus. It has a saw-mill producing 80,000 feet of lumber daily, principally used in the construction of the Chandler and other mines. The first ore train entered this town Aug. 15, 1888, and through trains between this point and Duluth, Minn., were put on the Duluth and Iron Range Railroad Aug. 21, 1888.

Fort Wayne, the county-seat of Allen County, Ind., on St. Mary's river, in the northeastern part of the State. It originated in a fort built in 1794 by Gen. Anthony Wayne. The inhabitants in 1828 numbered 500; in 1840, 1,200; in 1860, 10,319; in 1880, 25,760; in 1888, estimated at 40,000. The first city charter was granted in 1839. On July 4, 1843, the Wabash and Erie Canal was opened. Nine railway lines pass through the city. Improved farms and forests of hard-wood timber surround the city. Within thirty-five miles are 23 stave and bolt factories; the annual output of each is from 500,000 to 13,000,000 staves and headings. There are 4 banks, 5 daily newspapers, 10 miles of street-railway, a public and a Catholic library, Young Men's Christian Association reading-rooms, and churches of all denominations. There are five Catholic church, school, and hospital buildings. Their library cost \$65,000, exclusive of books, and contains 5,000 volumes. The First Presbyterian, recently erected, cost \$90,000. There are 12 public-school buildings. The system was established in 1858, and re-organized in 1873. The attendance is 3,500 pupils. There are several institutions for higher education, notably Methodist and Lutheran. There are forty miles of water-main, supplying water for domestic purposes and fire protection. Forty-two thousand dollars were expended in improvements of sewerage during 1887, and \$77,000 on streets and side-walks. There are two opera-houses, a Masonic Temple, and an academy of music. The new Government building, a handsome structure, cost \$200,000. The city is lighted by electricity. The manufacturing industries include the shops of the Pennsylvania Railway Company, the White wheel-works, employing 130 hands, with monthly wages of \$4,000; a walnut-lumber firm employing 200 men and manufacturing 6,000,000 feet of walnut alone yearly; a company manufacturing gas-work machinery and apparatus, a brass-foundry, two large breweries, wagon and pulley works, handle-factories, grain-elevator, woodworking and mill machinery, iron-works, lumber yards and mills, and coffee, spice, baking-powder, and flouring mills.

Glenwood Springs, an incorporated town in Garfield County, Col., at the western base of the main range of the Rocky Mountains, where the Roaring Fork enters Grand river.

Its growth, previous to getting railroad connection with Denver, was very slow, but since the autumn of 1887 the population has increased to 3,000. This is due to the advantageous situation of the town as the supplying-point of the Grand River valley; and to the presence there of remarkable thermal springs, in the utilization of which a large capital is being invested. The advantage of situation consists in its being at the convergence of three main valleys along which will naturally flow the products of mines and ranches, and currents of travel. Two railways, the Colorado Midland and the Grand River branch of the Denver and Rio Grande, now terminate at Glenwood, but both are to be extended westerly. The Burlington and other routes have been surveyed through this point, which thus bids fair to become a railway center, and consequently a point of commercial supremacy. This part of the State abounds in coal, both anthracitic and bituminous. The former is of excellent quality, and from the latter superior coke is made. About 15,000 acres of coal-lands were taken up in this district previous to 1887, for which the Government was paid nearly \$204,000. Many mines and coking-ovens have already been opened by corporations, and preparations are making for others. Much of this product is directly tributary to Glenwood. Immense bodies of hematite and magnetic iron ore occur in the mountains, at places easily accessible; while lime, fire-clay, and other furnace ingredients abound. Hence it is expected that smelting-furnaces and iron-mills will be erected at Glenwood within a short time, to which could be most cheaply brought (as it is all down grade) the silver and lead ores mined in the high ranges eastward and southward, while branch railroads about to be constructed will add to the list of mines tributary to this new town. There is little room for agriculture in the immediate vicinity, but farther down Grand river lies an extensive ranching and cattle-grazing district, which will sell and buy from this market the moment that railway connection is established. The thermal springs here are of remarkable size and power. They gush out in many places along Grand river, just below the picturesque cañon at the mouth of which the town is built. The principal one is in the edge of the city, and has a basin sixty feet in diameter. The overflow of this is conducted into an oval pool, floored and walled in with concrete and masonry, which is nine hundred and sixty feet in length. Beside this great pool elaborate bath-houses, parlors, amusement-rooms, etc., have been built, in which all modern appliances are employed, and in connection with which a large hotel and sanitarium are in process of erection. These buildings are steam-heated, lighted by electricity, and surrounded by ornamental grounds. The temperature of the waters at their exit is 126° Fabr.; and some springs arise inside small caves which are filled with steam, forming

natural vapor-baths. The water is clear, and not unpleasant in taste or smell when hot and fresh. They contain an unusual quantity of solid ingredients, such as salts of soda, magnesia, iron, and lime, with sulphur and carbonic acid, and are believed to possess remedial qualities of a high order. The altitude of the locality is 5,200 feet, and the air and water of that purity to be expected among the mountains. The town is well built, and contains school-houses, churches, and business blocks that would do credit to a far older and more populous place. There are three newspapers, two of which are dailies; two banks, with a capital of \$100,000 each; and two large hotels. Water is supplied by a gravity system from a mountain brook; and the streets and most of the larger business-houses and dwellings are lighted by electricity.

Hastings—the county-seat of Adams County, in the southern central part of Nebraska, on the Chicago, Burlington, and Quincy Railroad, 180 miles west of Omaha. This city has grown up during the past ten years with phenomenal strength and vigor. It has a population of 12,000, and, besides the main line of the Burlington system, has branches of the Union Pacific (St. Joseph and Grand Island Railroad), the Missouri Pacific, and the Northwestern (Fremont, Elkhorn, and Missouri Valley Railroad). Other railroads are surveyed to reach this point. The surrounding country is fertile and well settled. Corn is the principal crop, but the rearing of live-stock is an equally important industry. The city is solidly built, in its business part, while its more scattered residence portion possesses many handsome houses. The principal streets are paved and sewered, and the whole city is lighted by gas and electricity. Twenty miles of horse-car tracks have been laid. There are two daily newspapers, a board of trade, several banks, a powerful loan-and-investment association, and considerable wholesale business. In addition to the public schools, which occupy large brick buildings, there is here the nucleus of a university in Hastings College, an institution under the control of the Presbyterians, which is well endowed and offers a full course of collegiate instruction. This school admits both sexes to equal privileges, and has about two hundred students. All the leading religious denominations have churches, and the Young Men's Christian Association, the Masonic, and other societies, maintain their organizations. There is a large and handsome opera-house.

Hutchinson, a city, the county-seat of Reno County, Kansas, on Arkansas river, at the point first reached by the Atchison, Topeka, and Santa Fé Railroad. The population, by official census returns, has increased more than 10,000 in three years. It was founded in 1872 by Clinton C. Hutchinson, and all deeds to town lots contained forfeiture clauses prohibiting the sale of intoxicating liquors and keeping of

gambling resorts. The first newspaper was published in 1872, and 5,000 copies were printed and sent East as advertisements. At the same date a population of 600 incurred a debt of \$100,000 for public improvements. Four bridges (one 1,680 feet long) and a court-house were built. The growth was slow and substantial, and proportioned to the settlement of the county, a rich agricultural region. There are two other lines of railroad, and two more are approaching. Hutchinson has twelve salt companies. A recent drill for natural gas resulted in the discovery, at a depth of 425 feet, of a salt-deposit from 800 to 820 feet thick, and 10 miles square. Salt is brought to the surface by saturation of water in wells, which is pumped to large tanks and evaporated. The tanks present a curious appearance, owing to crystallization of salt through the leaks. The ground beneath often resembles snow-drifts. The aggregate capacity of the works in operation is 5,700 barrels of salt a day. The freight on lumber for the year was \$150,000; on coal, \$150,000; and on building-stone, \$100,000. The business-houses are of brick and stone—181 of these and 1,880 dwelling-houses were constructed during the year past. Hutchinson is fast becoming a meat-packing center and manufacturing point. The capacity of a meat-packing establishment in operation is 2,000 hogs a day. A contract was signed at Chicago, in September, 1888, for the erection of a large lard-refinery and cotton-seed-oil factory and a pork-packing house. The buildings and plants will cost \$500,000. A stock-yard and salt company has paid \$98,000 for grounds, and it is contemplated that \$500,000 will be invested. The city is lighted by gas and electricity, has water-works, street-car lines, a daily newspaper, telephone facilities, and comfortable hotels. The schools are excellent; the churches numerous and well supported. There is a handsome Masonic Temple.

Jacksonville, Duval County, Florida, a commercial city and winter resort, on St. John's river, 15 miles from the ocean, in the north-eastern part of the State. The population is 25,000. During the winter season from 60,000 to 70,000 visitors register at twenty hotels, in addition to others in boarding-houses. It is lighted by gas and electricity, has street-railways, daily newspapers, telegraph, ocean and domestic, and telephone facilities; 2 National, 3 private, and 2 savings banks; 8 miles of cast-iron water-main, with water-supply from artesian wells, and 9 miles of terra-cotta sewers. The sanitation is elaborate, but during the year there were 4,711 cases of yellow fever, and 412 deaths. The tide rises three feet in the river. The city has an ocean port, the harbor being improved by jetties at the mouth of the river, in operation since 1879. There is a foreign and coastwise commerce. The river traffic has decreased of late years, by reason of increase of railroads, of seven of which Jacksonville is the terminus. The total

2,208 miles in the State are tributary to the city. It is a center of fruit-packing and shipping. A company has been organized for orange-auction and forwarding. The leading jobbing business is the wholesale grain and feed trade. There are 90 wholesale establishments and 500 retail, which employ nearly 5,000 hands. The amount of business capital in both branches is \$20,000,000. A cotton-house, with gin and press, is being erected, and the city will eventually become a cotton-center. There is a direct line of steamships to New York. A new charter has recently been granted, by which the corporate limits are extended. The public schools number eleven, white and colored, with an attendance of 2,254 pupils. The value of school property is \$70,500. There are also private, art, and music schools, and a Young Men's Christian Association. The streets are paved, and there are shelled roads. It has lumber-mills, cigar-factories, a brush-factory, boiler and machine shops, foundries, marine railways, jewelry and curio, carriage and wagon, and ice factories, a coffee and spice mill, binderies, and other manufacturing industries.

Lincoln.—The capital of Nebraska, in Kent County, 65 miles southwest of Omaha; population, 35,000. There is no river here, or natural site for a town; but the place was chosen to be the capital when it was a mere cross-road because of its central position in what then constituted the population of Nebraska. The State became owner of the town-site, and sold nearly \$400,000 worth of lots within a few years, so rapidly did people assemble and property appreciate. Lincoln is now the railroad-center of the State. The Burlington route's trains enter and leave over six different lines; the Union Pacific has lines both north and south; the Elkhorn route comes in by two lines, and the Missouri Pacific by one. At least 1,000 men are employed here by the railways alone. Partly as cause, partly as effect of these railroad facilities, an enormous wholesale and jobbing trade has arisen. The sales of groceries amount to \$4,000,000 annually. Agricultural implements, cigars and tobacco, dry goods, drugs, and liquors follow, augmenting the wholesale business to \$12,000,000 annually, making it a serious competitor in trade with Omaha, St. Joseph, and Kansas City. As a grain-market Lincoln is important. Her merchants own seventy-five elevators in all parts of the State, and handle three fourths of the cereal-crop of Nebraska—i. e., from fifteen to twenty million bushels of corn and small grains. Ten Eastern grain-dealers maintain buyers here. Live-stock forms another element of prosperity. Three quarters of the total shipment of beef and swine from the State passes through Lincoln, and is quartered in her immense stock-yards. Two pork-packing houses represent, combined, a plant of \$200,000, and can pack 5,000 hogs a day; a

beef-packing house is soon to be built. Factories of several kinds are rising. The brick-and-tile works employ 150 men the year round, and can make 50,000 common bricks and 12,000 pressed bricks daily, besides all sorts of tiles. The Lincoln canning-factory is capable of packing a million cans of vegetables and 2,000 barrels of vinegar in a year. In all, 70 factories are now counted in the city, whose combined product amounts to \$8,000,000 annually. As the capital of the State the city has many public institutions, some of which are imposingly housed. The new Capitol is a stately edifice, after the style of the Capitol at Washington, built of white limestone from the bluffs of Platte river, and capped by a dome rising 200 feet above the trees of the park in which it stands. The interior is handsomely finished, and the whole building cost \$500,000. Three miles southward is the State Insane Asylum, and the Penitentiary stands in another suburb. The post-office and other Federal offices occupy a large and ugly structure on the public square, and a county courthouse is soon to be built at a cost of \$200,000. Lincoln derives a large part of its distinction from its institutions of learning. Here is the State University, occupying a group of large buildings in shaded grounds, which form a park in the midst of the town. These grounds were reserved by the State, and the main building was erected in 1870, at a cost of \$140,000, out of funds accruing from the sale of city lots. Since then other buildings have been added, laboratories furnished, etc., until now this university is one of the best equipped in the West. It is under a board of regents, and will ultimately embrace an academic course, an industrial college, and colleges of medicine, law, and the fine arts, to which will be added special advanced courses; only the first two are organized, as yet, under sixteen professors and several instructors. A preparatory school is attached, and the tendency of the curriculum is toward modern and practical requirements, rather than toward classical training. This appears in the prominence given to the Industrial College, which offers two courses, leading to the degrees of bachelor of agriculture and bachelor of civil engineering. An experimental farm is carried on by the State in connection with this college. In 1887-'88 this university had 400 students. It is free to residents of Nebraska, and receives, without further examination, the graduates of about twenty accredited high-schools in the State. Besides this, the Methodist Church opened in September, 1888, the Wesleyan University. It occupies a building costing \$70,000, three miles from the center of the city, and owns 240 acres of gift land. This school is designed to be a university, and among its foremost departments will be a polytechnic school. A third university, just founded, is under the care of the Campbellite Church; and the Roman Catholics support a

convent school having 150 pupils. Business colleges and a complete system of public schools are to be added to this remarkable list of educational facilities. The State Library has 80,000 volumes, and is especially rich in law-books. The society of Lincoln is of an intelligence and culture unusual in towns so far west, and the wealth is considerable. The city is therefore well kept and handsome. All of the principal streets are well shaded and paved, and street-cars run in every direction. Gas and electricity light the streets and houses. Many examples of modern architecture, commercial and domestic, adorn the town, and some of the churches are costly and handsome.

Mobile, the only seaport of Alabama, on Mobile river, at the head of Mobile Bay, 24 miles from the Gulf of Mexico. The population in 1880 was 29,132; in 1888 it was estimated at 40,000. The Government has appropriated \$250,000 for improvement of the harbor, where deep water is needed. At present vessels of 15½ feet are floated. During the year 188 vessels entered the port, with a tonnage of 128,250 tons. It is the outlet of 2,000 miles of navigable rivers, passing through rich agricultural, iron, and coal regions, and it is important as a coal port. The trade in coal for the year was 39,433 tons, of which 648 were imported. Next to New Orleans it was the largest cotton-receiving market of the South prior to the civil war, the average annual exports for five years being 682,308 bales. The receipts (which have been greatly diminished by increase of railroads and construction of interior compressors) for the year 1886-'87 were 216,142 bales. Timber has largely replaced the cotton interest; the shipments, foreign and coastwise, reach yearly 80,000,000 feet. From 150,000 to 200,000 pieces of white-oak for wine-barrel staves are shipped yearly, bringing from \$120 to \$150 a thousand; and the Seaboard Oil-Refining Company, of New York, has its staves for oil-barrels manufactured here. Cypress shingles are a leading industry; 130,000,000 were the combined product of eight mills in 1887. The dust, composed of long, stringy particles, is used in constructing roads through the marshes by which the city is surrounded, forming an elastic, soundless road-bed. The wool trade is increasing, and the sales of rosin and turpentine during the year reached 132,092 and 28,725 barrels respectively. Truck-farming in the suburbs began in 1879, and is a profitable investment. The value of the crop of the past year was \$294,971. There are five railroads, one recently completed to Birmingham, and a steamboat trade with Montgomery. There is a line of steamers to Liverpool, England, and one to New York. Water-works costing \$500,000 have been recently constructed, and \$240,000 were expended on new wharves during 1887. There are 5 banks, 9 insurance companies, 34 churches, 1 daily and several weekly newspapers, 4 orphan asylums, a United

States marine hospital, a Jesuit college, academies, and numerous private schools. The High-School, for colored children, is a large building. There are electric and gas works. Mobile has the only American Anti-Friction-Metal Company, with a daily output of 5,000 pounds, tan-yards, paper and wooden box, barrel, harness, saddlery, wagon, and other factories, and cotton-mills in operation and constructing. African Village, a few miles distant, contains all survivors of the last slave-ship that entered Mobile Bay (in 1859), the majority of whom were freed by the emancipation proclamation before being sold. Many of the older ones speak their native tongue.

Montgomery, a city, the capital of Alabama, in the county of the same name, on bluffs of the Alabama river, 400 miles above Mobile Bay and 40 miles below the junction of the Coosa and Tallapoosa rivers. The population in 1880 was 16,718; in 1886, nearly 30,000. Navigation is open all the year. The city lies in the prairie belt, between the northern and southern pine regions, and its resources are in agriculture, mineral development, and yellow pine and hard woods. It was incorporated in 1837, and made the capital ten years later. Since 1880 it has enjoyed a "boom," and shares in the prosperity of Birmingham and other mineral districts. During this period, over 2,500 dwellings were built and occupied within its limits. About twenty-five per cent. of the inhabitants are engaged in manufactures. From 120,000 to 140,000 bales of cotton are handled yearly. There are 7 large storage warehouses, with capacity of 73,500 bales, 2 compresses, and 4 ginneries. There are 8 railroads, with lines in six directions. The bulk of river trade is controlled by a city steamboat company, giving bills of lading to New York and Liverpool, *via* Mobile. The total tonnage yearly of all freight is 500,000 tons. A narrow-gauge railroad of fifty miles, southeast to the timber district, has been constructed. The total capital invested in business for 1887, was \$15,595,000, and the annual volume of business was \$80,185,000. The grocery trade reaches \$7,000,000, and the dry-goods trade \$8,000,000 yearly. The city is lighted by gas and electricity, and has an electric railway of fifteen miles. Power is applied overhead. Water-works supply 5,000,000 gallons of artesian water, and the drainage is perfect. There are 5 banks (2 National), 3 daily newspapers, 2 theatres, 7 hotels, 1 infirmary, and 9 churches for whites. There are 5 public-school buildings (3 white and 2 colored), a business college, and private schools. A State University has been recently founded. Two land companies have parks at Riverside and Highland Hill, the former a manufacturing suburb, the latter a place of public resort. Land is given to manufactures, which include an iron furnace, foundries, and machine and car shops, and boiler-works, cotton, cotton-seed-oil, flouring and wood-work-

ing mills, brick-yards, carriage and wagon, ice, candy, soap, fertilizer, cigar, paper-box, vinegar, cracker, and sausage factories, a plant for distilling alcohol from smoke, and an oil-refinery. The Capitol building was erected in 1851, on a site reserved by the founder in 1817 for the anticipated purpose. The United States Post-Office (which cost \$180,000) and city buildings are handsome.

Montpelier, Indiana, 88 miles south of Fort Wayne, on the main line of the Fort Wayne, Cincinnati, and Louisville Railway; population estimated at 1,000. The town is on an elevated plateau, by the Salamonie river. Three gas-wells are in operation, flowing millions of cubic feet a day. The town is thoroughly piped, and by means of pipe-lines could easily furnish gas to many other towns and cities of northern Indiana. Petroleum exists also in a field 20 miles in length. A well within the corporate limits flows 100 barrels in twenty-four hours, with double capacity by pumping. Building-stone and limestone abound. There is a large quarry, with latest improvements in steam machinery, electric blasting, etc., where 25 cars can be loaded daily. The timber-supply is very large. Glass-sand of superior quality is found in close proximity. The drainage is excellent, and the water-supply abundant. There are 4 churches, a Citizens' Bank, with assets of \$297,000, two hotels, and good schools. A large bending-works has been erected. Free gas and free land are offered as inducements to manufacturers. Rail connection with the great trunk lines is made.

Muncie, a city of Indiana, the county-seat of Delaware County, on an elevated plateau above White river, east of the center of the State. The population in 1880 was 5,263; in 1888 it was estimated at 14,000. It is surrounded by a thriving farming community. Natural gas was discovered in 1886, and twenty wells are in operation, averaging 915 feet in depth, with a total capacity of 90,000,000 cubic feet in twenty-four hours. The gas is of excellent quality, dry, and free from sulphur. The Trenton rock, which here reaches its highest point, with a downward trend to east and west, is struck at 75 feet above sea-level, and is drilled to a depth of 80 feet. Muncie has three competing trunk lines of railroad, affording access to markets in all directions. The electric lights, in addition to gas, are of two systems. There are 12 churches, 8 daily newspapers, a library, 4 banks (one of which is National), 4 brick school-buildings, valued at \$100,000, with a regular attendance of 1,300 pupils. The water-works have a pumping capacity of 2,500,000 gallons a day. Water for manufacturing is supplied by the river and Buck creek, and is offered free, as are gas and land, to induce location. There are five miles of sewers, telegraph and telephone facilities, and a paid fire department, with electric alarm. Muncie has a board of trade. Establishments located or contracted for are: A bending-works; a

jute-bagging factory, with capacity of 20,000 yards a day, employing 200 hands; machine-shops; a saw-mill; bridge and wood-carving companies; a straw-pulp, a paper, 3 glass, and a rubber works; skewer, duster, handle, wheel-furnishing and heading factories; flour-mills; elevators; and minor industries. About 2,000 hands are employed. The court-house, recently completed, is a handsome structure, costing \$250,000. There is an opera-house and a free mail-delivery.

New Orleans, a city and port of entry of Louisiana, on Mississippi river, 105 miles from its mouth. During the winter there is an influx of from 20,000 to 40,000 visitors. The population in 1870 was 191,418, of whom 142,293 were whites; in 1880, 216,090 (whites, 158,367); in 1887, 246,950 (whites, 202,800). The debt of the city, Sept. 1, 1888, was \$17,491,546.58. This amount does not include the Gaines judgment, on appeal, for \$1,925,667.82. New Orleans is the largest cotton-receiving market in America, and the largest in the world, with the exception of Liverpool. But the percentage of the total crop received has fallen behind, owing to the large overland movement from the interior. Its cotton exchange was established in 1870. The receipts for the year 1887-'88 were 1,912,228 bales, averaging \$46.25 a bale, out of a total crop of 6,928,245 bales. The largest receipts were in 1861, viz., 2,255,448 bales. The largest since the war were in 1882-'83, viz., 1,999,598 bales. The exports for the year 1887-'88 were 1,560,994 bales, valued at \$71,844,280. In 1880 there were nineteen establishments for cotton-compressing. Prior to 1880 there were but two through railroads. At present there are six trunk lines, constructed in consequence of the completion of the jetties in Mississippi river in 1879, assuring deep water and an ocean terminus at New Orleans. The freight of these for the year ending Aug. 31, 1888, was 2,568,624,551 pounds forwarded, and 2,992,532,335 pounds received. The tonnage of two canals for the year, of 5,978 vessels, was 105,441 tons. There are numerous canals for drainage. The height of ante-bellum prosperity was reached by New Orleans in 1860. Only produce of the lower Mississippi valley was exported. At present the tonnage of the port is greater than ever, and the amount of commerce is much larger. The character of the imports and exports is completely changed. The greatest advance of late years, and the most promising field of the future, lies in coal and iron from Southern districts in course of development; in lumber from Southern forests; in the wool and hide trade of Texas and Mexico; in various Mexican produce; and in wool, fruits, and other products of California and the Pacific coast. The foreign imports include tea, silk, Japan ware, kari gum, Alaskan furs, whale-oil, spermaceti, walrus ivory, cochineal, balsam, orchilla, rubber, jalap, sponges, mohair, etc. The ocean traffic with New York has been extended, and vast additions are made to

the usual cargoes of cotton, sugar, molasses, and rice to that port. Raw material is returned manufactured, and large imports are received through New York. The average yearly receipts of wool are 80,000,000 pounds, the immense wool trade of Texas passing through the port; and of hides, upward of 12,000,000 pounds. The trade in tropical fruits of Central and South America, originated a few years ago, has increased with steady growth, and is now the largest single item of foreign importation; 50,000 bunches of bananas were imported in 1880. For the past year 2,500,000 bunches were imported, against 1,421,145 bunches in 1887; and 6,000,000 cocoa-nuts, against 2,449,915 of the year previous. The grain trade with the interior is fluctuating. The total value of domestic produce received by river, lake, and rail for the year ending Aug. 31, 1888, was \$168,474,398. By United States Custom-House statement, the imports of foreign goods for 1888 were \$11,558,562; exports, \$80,698,062; customs receipts, \$2,791,984. The foreign exports for the year were \$504,808; transshipments to Mexico, \$2,085,957; imported commodities entered without appraisement for transportation to interior points, \$2,756,858. The number of vessels clearing the port for the year ending July 31 was 1,081, with a tonnage of 1,150,430 tons, and 1,060 vessels entered, of 1,151,715 tons. The number of vessels belonging to the port at same date were 437; gross tonnage, 50,850. The manufactures have largely increased, outstripping the commerce. The capital invested in 1870 was \$5,429,140; in 1880, \$8,565,803; in 1888, \$21,667,670. In 1880 there were 915 establishments, against 2,185 at present; and 4,411 hands were employed, against 28,865 to-day, of whom 6,270 are women. The yearly wages are \$8,242,599, slightly less than the entire capital in 1880. The products are valued at \$41,608,546. Raw material of all kinds is in close proximity, and transportation to factory and market is cheap. Exemption from taxation and license was secured for ten years by the Constitution of 1879, extended in April last for a similar period. The principal advance has been in the manufacture of boots and shoes, of which there are 226 establishments; in men's clothing, manufacture of jeans having been recently introduced; in foundries and machine-shops, which supply most of the machinery for Southern cotton, rice, and sugar mills; in lumber, malt liquors, artificial ice, and fertilizers; in rice-cleaning and polishing and sugar-refining. Hawaiian sugar is imported for this purpose in addition to Cuban. There are two large refineries and a sugar exchange. The tobacco production has doubled. For 55 establishments in 1880 there are at present 188, and 33,120,667 cigars and 33,888,245 cigarettes were manufactured during the year, while 1,688,688 pounds of manufactured tobacco, 141,916 of perique, and 37,824 of snuffs complete the output. There is also in-

crease in manufacture of cotton goods. Other industries include artificial limbs and flowers, bags, bagging, boxes, bricks, brooms and brushes, canned goods, carriages and wagons, cars, cisterns (a local industry), confectionery, coffins, corks, corsets, cotton-seed oil, china, cordials and sirups, distillation of pine, drugs, dyes, flags, food, furniture, hardware, hair-work, glycerine, hammocks, hosiery, moss, mattresses, mineral waters, perfumeries, pottery, saddles and harness, safes, soap, sails, shot, trunks, tinware, and vinegar. The clearings of 14 banks (8 National, with capital of \$2,925,000, and one a United States depository) for the year ending August 31 were \$448,016,066, an increase of \$41,447,618 over those of 1887. The balances are \$52,970,305. The insurance companies number 16, and there is a State lottery with a capital of \$1,000,000. There are 6 street-railroads and 7 daily newspapers, 1 in the French and 1 in the German language. In 1884 the churches, including colored, numbered 171. Public schools were established in 1840. The attendance is large. Among other educational institutions are Tulane University, the Jesuit College, and the Ursuline Convent. There are 17 public parks. Hospitals, asylums, and infirmaries are numerous. Architecture, for which the city was never noted, has recently progressed. Drinking-water is obtained from cisterns, and there are water-works from the river. An artesian well, owned by an ice-factory, yields 150,000 gallons from a depth of 600 feet. The Custom-House, next to the Capitol and Treasury at Washington, is the largest public building in the United States. Two opera-houses (one French) and numerous theatres and clubs provide amusement during the season from January to May. A cotton exposition was held in 1884-'85, toward which Congress appropriated \$1,865,000, with \$300,000 for exhibit. (See "Annual Cyclopædia" for 1884, page 578.)

Ogden, Weber County, Utah, at the foot-hills of the Wasatch mountains, near Great Salt Lake, at the junction of Weber and Ogden rivers. It has a population of nearly 9,000. It is the center of five leading trunk lines of railroad, receiving (on a basis of the first four months of the year), 19,278,000 pounds of freight, and forwarding 8,268,000 pounds. The revenue to the railroads is \$368,886.68. Other roads are building, contracted for by Ogden citizens. It is known as "Junction City." The streets are wide, and there is natural sewerage, with running water on both sides of the sidewalks. Water is supplied by mountain springs and streams. The town is lighted by electricity, and there are street-cars, telephones, etc. The productions of the region include iron, which abounds in brown and purple hematite ores, cost of delivery, \$1.50 to \$2 a ton; wool; salt, evaporated naturally from the lake; lime, in mountain deposits; building-stone; and coal. Coke is furnished by gas-works. Ogden possesses valuable water-power.

The fall in Ogden cañon is 550 feet in five miles. The motors of an electric-light company, a powder-mill, and several flouring-mills are run by this power. There are, in addition, a woolen-mill, and cigar, knitting, and canning factories. Fine fruit is grown in the surrounding country. The educational and religious advantages are good. The Central School is a handsome building, and there is a fine hotel.

Port Arthur, a city in the province of Ontario, Canada, population 6,000, situated on the west side of Thunder Bay, at the head of Canadian navigation on Lake Superior, and 60 miles west of the Nipigon river. In 1800 it was a terminal point of the Hudson Bay Fur Company, and in 1872 it was named Prince Arthur's Landing in honor of Prince Arthur, then a resident of Canada. It has public and private schools of the highest grade, a courthouse, a town-hall, board of trade, registry, port, and inland-revenue offices. It has two banks, brick blocks valued at \$300,000, and first-class hotels. There is a fine harbor in which the Government has constructed 2,000 feet of a breakwater at a cost of \$150,000, the entire projected length being about a mile. Within the harbor lines are 2,500 yards of docks. It is located on the Canadian Pacific Railway line, and is a terminus for both the eastern and Lake Superior division and the western or prairie division. Its grain-elevators have a capacity of 2,000,000 bushels. In the vicinity are extensive quarries of marble and limestone suitable for building purposes, and inexhaustible quantities of brown and red sandstone, slate, and granite. Silver and gold mines, discovered in 1883, are located forty miles southwest of the town. An unlimited extent of mining land may be purchased from the Crown at \$2 per acre. It is the center of exploring and prospecting parties. The mining districts are known as the Beaver and the Silver Mountain, the former employing 48 men. The tunnel of the Silver Mountain mine is 1,400 feet in length, and the shaft is 400 feet deep. The value of real estate in 1887 was \$1,250,000. It has steamboat connection with Fort Williams four times a day. Twenty-five miles distant are the Kakabeka Falls on the Kaministiquia river, a celebrated resort for tourists. A daily paper, the "Port Arthur Daily Sentinel," is published, and a daily steamboat line runs to Duluth, connecting with the trains of the Canadian Pacific Railway.

Providence, one of the capitals of Rhode Island, at head of Narragansett Bay, 34 miles from the ocean, was founded by Roger Williams in 1636. Seventy years later the population was 1,500. In 1832, when incorporated, it had 18,000 inhabitants; in 1870, 68,904; in 1880, 104,857; in 1887, 122,050. The manufacture of cotton was introduced in 1793, and of woolen goods a few years later. The number of establishments in the State in 1885, of which Providence was the natural headquarters, was: Of cotton, 90, capital \$21,-

150,000, product, \$21,770,000; of wool, 34, capital \$8,560,000, product \$18,980,000. Other manufactures are gymnastic apparatus and jewelry which is one of the most extensive industries. There is a large British hosiery mill and colony. Notwithstanding its location, Providence has no foreign commerce. There is a line of steamships to New York and Boston, and the city is the terminus of a Baltimore line of coast steamers connecting at Baltimore and Norfolk with railroad and other steamboat lines. There are local lines to shore resorts, which are numerous. The streets are narrow but remarkably clean. To Sept. 30, 1884, the water-works had cost \$6,491,167.60, and the sewerage, \$1,685,214. At the same date there were 86 churches; 1 high, 11 grammar, 38 intermediate, and 43 primary schools, costing yearly \$252,326; and 14 lines of horse-car railways. Among the public buildings may be mentioned the State-House (built in 1759), the Friends' Meeting-House (in 1727), the Board of Trade (erected as a market in 1773), the First Baptist Church (in 1775), and University Hall (in 1770). The city hall cost \$1,500,000. The Narragansett Hotel, completed in 1878, is eight stories high; its cost was \$1,000,000. It is of pressed brick, and can accommodate 400 guests. The Masonic Hall, Butler Exchange, Arcade, library, and court-house, are some handsome specimens of modern architecture. The State Prison is at Providence, and there are numerous hospitals and asylums. Roger Williams Park contains 100 acres. The Washington Insurance Company, organized in 1799, has extended its business largely of late years. The new Catholic cathedral and opera-house are fine edifices.

Quincy.—A city of Adams County, Ill. The population in 1880 was 27,268, but there was an increase of 30 per cent. by 1887, and it is believed that the census of 1890 will show 40,000. This is due to an awakening of enterprise on the part of the citizens. Previous to 1885 trade was stagnant, manufactures were depressed, property was low in value, taxes were high, the city was deep in litigation and debt, and everybody was discouraged. "Then some of the patriotic citizens who had hitherto held aloof from local affairs began the work of restoration and redemption. The lawsuits were compromised, the debt was funded, streets were improved, water, gas, and electric lights were provided, and municipal enterprises awakened the people. . . . The citizens began to realize the enormous natural advantages of their situation, and to seek the trade of the million or more people who live within 75 miles of her court-house. Capital appeared from its hiding-places, labor flocked in to take advantage of high wages, manufacturing establishments sprung up like magic, real estate rose in value, extensive building operations began, and everybody prospered." The number and beauty of the public buildings that

now grace this town are remarkable—a fact partly due to the stores of excellent brick-clay and architectural stone in the immediate neighborhood. These include a new Federal building, a new city hall, and a new county court-house, all of noble and costly proportions. The State of Illinois has just completed here the erection and installment of a soldiers' home, which occupies spacious ornamental grounds on the edge of the city, and shelters nearly six hundred veterans of the civil war. This home is arranged upon the cottage-plan, squads of forty-five or fifty dwelling in detached houses, but all assembling for meals, for amusement, for public entertainments, Sunday worship, etc., in the large central building. The buildings all differ in materials and design, so that the architectural effect is varied and pleasing. There are a hospital, dairy, railway station, etc. This was the first of the State institutions of this kind; but Iowa, Michigan, and some other States have followed the example. The latest new public building is the handsome public library. This faces the city park, has a frontage of 100 feet and capacity for 100,000 volumes. It was built by popular subscription, and is well supported. Besides the book-shelves, the building contains reading-rooms, study-rooms, etc. Quincy takes great interest in intellectual and literary matters, and supports many reading-circles and literary and self-improvement societies.

Raleigh, the capital of North Carolina, in Wake County, near the center of the State. The population in 1870 was 7,900; in 1880, 9,265; in 1887, 14,000. It is lighted by electricity, has a street-railway, and has contracted for water-works and an improved sewerage system. The mechanical industries are car-shops, with capacity of ten cars a day, two clothing-factories, a cotton-seed-oil mill, a manufacturing company to make shuttle-blocks for cotton-mills and grind phosphates, an ice-factory, an iron-foundry, and a shoe-factory, with minor establishments. A good business is done in cotton; from 50,000 to 75,000 bales are handled yearly. Here is a white marble post-office, which cost \$355,000, and a new brick school-house, which accommodates 700 pupils. The Capitol building, a massive, domed structure of gray granite, is at the junction of four avenues. The State Penitentiary, costing upward of \$1,000,000, for which \$75,000 was appropriated yearly for ten years by the Legislature, is a model institution. It contains within stone walls the low log structure first used for penal purposes by the State. One of the State insane asylums, of which there are three (two colored and one white), is on the outskirts; and institutions for the deaf, dumb, and blind are located in or near the city. A fine geological museum is in the Agricultural Department. The attendance on the public schools reaches 2,000 pupils. In addition, there are a Baptist and an Episcopal school for girls, a boys' academy, and other private schools. Wake Forest,

a Baptist College, and the University of North Carolina, at Chapel Hill, are distant a few miles. There are a university, a normal, and a medical school for colored students. The first and last of these are supported by philanthropic donations, and conducted by the Baptist Home Missionary Society. Together they occupy six buildings, on a campus of twelve acres, and have 450 students. The departments are industrial, normal, academic, theological, and legal. Shade-trees of elm, oak, and magnolia and flowering gardens for nine months in the year, are a feature of the city.

Santa Fé, the capital of New Mexico Territory, 20 miles from Rio Grande river, in a basin surrounded by mountains, 7,300 feet above the sea. The population in 1850 was 4,846; in 1888 it was estimated at 7,000. Seventy per cent. are Mexicans. The climate is delightful. The temperature is remarkably even. A sanitarium, with capacity of 640,000 cubic feet, for Eastern invalids, has been established, the only one within the Territory. There is also a hospital for Territorial patients, with air-space capacity of 288,000 cubic feet. The city is very old. In 1541 it was in existence as a "pueblo" of the Indians, and contained 15,000 souls. It became the capital of the Territory after occupation by the Spaniards, the present executive mansion having been erected at this time and known as the "Adobe Palace." It is one story high, with walls five feet thick. It is the only town in New Mexico with competitive railroad lines. Two roads are completed, and seven others projected to pass through, or with the city as objective point. Ten million pounds of wool are shipped yearly. A peculiar herb, "aurole," adapted for washing wool, which imparts a fine, soft gloss, abounds. Agricultural land surrounds the town, of which a large part is owned by the Government, and is subject to entry. There is a land-office. The rain-fall in 1881 was 21 inches, and it has since increased steadily. The county has produced more from mines than perhaps the whole Territory outside. The gold in placers of the Ortiz grant alone, of 60,000 acres, is estimated at from \$100,000,000 to \$150,000,000. The mine was once worked by 10,000 Spaniards. On expulsion of the latter in 1680, all mines were filled up by the natives, and churches and mining archives destroyed. Their return was permitted in 1705, under promise to discontinue mining forever. Copper, silver, lead, and zinc are also found. There are 20,000 acres of coking, bituminous coal, and 8,000 acres of anthracite. Nearly every religious sect is represented in Santa Fé. The cathedral, when completed, will cost \$400,000. The first Protestant church was built in 1855. The oldest church in the United States—that of San Miguel—founded in 1550, was rebuilt in 1710. It is of adobe. The total value of public buildings is \$1,250,000. There are three public schools, the University of Mexico (with an In-

dian department), a Catholic college and orphans' school, a Presbyterian academy, the Ramona School for Indian girls, costing \$65,000, and a Catholic school for Indian boys. A daily newspaper is published, and there are two national banks, capital of each, \$150,000. The Capitol, erected at a cost of \$200,000, and Territorial Penitentiary, \$150,000, are fine buildings. Adobe, or sun-dried earth, unburned, with or without straw, is the leading material for residences. Santa Fé has a planing-mill, a cracker-factory, and a brewery. Pottery is manufactured by the Indians.

Saratoga Springs, a watering-place of New York, 86 miles north of Albany, in Saratoga County, near the center of the State. The resident population is estimated at 12,000. There are upward of 40 mineral springs, with various medicinal properties. The principal are the Vichy, discovered in 1872, by drilling 180 feet. Water is forced to the surface by natural pressure of carbonic-acid gas. It is alkaline, rather than salt. There are a magnetic spring and baths near old High Rock. The Geyser, spouting 25 feet, was discovered in 1870. Others are the Congress and Columbia, in Congress Spring Park; the Hathorn, Empire, High Rock, Excelsior, Star, Champion, Hamilton, Washington, White Sulphur, etc. The tract was owned by Iroquois Indians of the Mohawk tribe, and was a favorite hunting-ground. The value of the springs was known to the Mohawks, Oneidas, Onondagas, Senecas, and Cayugas, who resorted to them. The Saratoga patent was sold to citizens of Albany in 1684. High Rock Spring was first visited by white men in 1767, when a wounded English baronet was restored to health. A settlement was made here in 1773. The present town was founded in 1819, and made a post-office in 1826. There are six mammoth hotels and numerous others, affording accommodations for from 15,000 to 20,000 visitors. The season is from July 10 to September 1. The architecture is varied, and the gardens and grounds extensive and beautiful. The attractions beside the springs are parks, drives, the lake, the race-course, and club-house. The Association for Racing was organized in 1864, and a charter was obtained in 1865. The town has one national bank, with a capital of \$125,000 and equal surplus. The town-hall was erected at a cost of \$180,000. The New York Central and the Delaware, Lackawanna, and Western are the principal railroads.

Tower, a town in northern Minnesota, incorporated in 1884, is situated in a region of valuable timber-land on the south shore of Lake Vermilion; population 5,000. It is one and one half mile from Tower mines, for which its provision-stores furnish supplies, no general store being located in the mining district, which has a population of over 1,000 men, the majority of them householders. It has five churches, two graded schools, the First National Bank of Tower, capital \$50,000, a

cold-storage warehouse capable of keeping two car-loads at the freezing-point, a brick-yard which turns out 20,000 bricks a day, a lumber company, the output of whose mills in 1888 was 10,000,000 logs, large shipments being made to Duluth, Two Harbors, and Ely, and ninety cars being used for the business in one month. There are two saw-mills with a capacity of about 80,000 feet of lumber daily, and a prominent social organization called the Skandinavian Society. Fine brick-clay is found in the vicinity, and east of the town is Burnt-side Lake, a popular camping-ground. The Minnesota Iron Company, Charlemagne Tower, of Philadelphia, president, employs 1,400 men, and holds 8,000 acres of land, covering the larger portion of the iron deposits in that district, extending to the shores of Lake Vermilion, and including the present site of Tower city and beyond its limits eastward for a distance of 75 miles. The ore is found in two lenses averaging 60 feet wide at an altitude of 1,000 feet above Lake Superior, and 1,600 feet above the ocean-level. The first ore was taken out in 1884, immediately subsequent to the completion of the railroad from Tower to Two Harbors in the spring of that year. The first shipments of ore, amounting to 64,000 tons, were made by railroad July 8, 1884. In 1886 the output reached 804,000 tons, and would make over 150,000 tons of rails, the Minnesota Iron Company contributing one tenth of the entire iron product of the Lake Superior region. The ore is principally celebrated for the small proportion of phosphorus contained in it, on account of which it is sought by manufacturers of Bessemer steel, who pronounce it the purest magnetic ore known. It assays as high as 68 per cent. of metallic iron and .055 of phosphorus. The veins of ore average from 16 to 160 feet in width, and the ore belt is from 6 to 10 miles wide. This mining region is regarded as virtually one great deposit of iron ore extending through the range of hills overlooking Lake Vermilion. In 1887 the output was over 450,000 tons. There are nine pits each furnished with the latest and most approved appliances for excavating, hoisting, and transferring to the ore cars. The pits bear the names of the promoters of the enterprise. The Stuntz pit is from 20 to 60 feet by 400 feet. At a depth of 60 feet the ore was brought through a tunnel to be hoisted to the railroad cars. The Stone pit, one eighth of a mile west of the Stuntz, is worked in three slopes, the width of the deposit varying from 25 to 125 feet, the deepest point below the surface being 100 feet. The mine cars are hoisted directly from this pit by powerful drums. The Ely pit, directly west of the Stone and adjoining it, when opened for a distance of 200 feet, showed a vein of good ore at the second level 129 feet wide. It is now 400 feet long, 50 feet deep, and from 20 to 120 feet in width. In the vicinity are two air-compressors for working powder-drills, two

engines and drums for hoisting purposes, and electric-light machinery consisting of 2 dynamos of 20 lights each, lighting pits, trestles, and docks. Two gangs of miners are worked, one by night and one by day, throughout the year. The number of men employed in the pits is about 1,100; the wages each month amount to about \$55,000. Tower pit No. 1 at a depth of 100 feet when opened for a distance of 250 feet on the length of vein showed good ore at one point over 155 feet in width. The ore of Tower pit No. 2 showed clean for 400 feet, with an average width of 100 feet in ore. The shaft in this deposit is 60 feet deep, the ore being taken through a tunnel from the bottom of the shaft to the railroad cars by an endless rope attached to 9 cars with a capacity of 2 tons each. The Breitung pit, where a diamond-drill is in operation, lies south of the Tower, and is from 10 to 40 feet wide by 100 feet long and 50 feet deep. The North Lee has been opened 200 feet in length by 50 feet in depth, and from 80 to 40 feet in width, a shaft having been sunk 50 feet below the bottom from which drifts are being run. The South Lee shows a vein 20 feet wide exposed for about 100 feet in length. The pits of this company are all comprised in the length of one mile. The ore bed is blasted with dynamite cartridges containing about 50 per cent. of nitro-glycerine, the blasts being discharged every six hours. The product of these mines, 4,000 tons of ore daily, is shipped to steel-works in Pittsburg and Chicago, and supplies furnaces in Duluth, Buffalo, Troy, Toledo, Ashtabula, Cleveland, Erie, Scranton, and other cities. The Minnesota Iron Company have expended in the building and equipment of the railroad and ore docks, and in the development of the mines not less than \$4,000,000. New receiving ore docks have been built by the company in Cleveland the present year (1888), bringing the ore into direct competition with foreign ores. An immense body of iron ore of a high grade has been discovered this year in section 19, by the Minnesota Exploration Company. Four miles from Tower is the Union mine, the property of which extends along the range for the distance of about a mile. The post-office of Tower mines is called Soudan. Tower is connected with Two Harbors by a railroad 68 miles in length, constructed in 1884, and extended to Duluth in 1887, connecting the mines with the capital of the State by rail *via* that city. The Duluth and Iron Range Railroad is equipped with upward of 350 double eight-wheel ore cars with a capacity of 24 gross tons each—the Minnesota Iron Company alone getting out the present year 180 cars of ore daily—and 17 large consolidated locomotives, which haul from 450 to 500 tons to a train. The railroad passes through spruce and tamarack swamps to Two Harbors and through miles of otherwise unbroken wilderness. The substructure across the swamps where it was said a railroad never could be built is a cordu-

roy three feet thick, supporting stone ballast over which from 2,000 to 3,000 gross tons of ore are transported daily during the shipping season. In the stock piles nine cubic feet of ore will weigh one gross ton. The grades are very steep, and over \$100,000 is to be expended in lowering them. This will admit of an increase in the length of the ore-trains. Nearly half a million tons of ore have been shipped over the road the present season. From Two Harbors to Duluth, Minn., the line passes along the shore of Lake Superior, opening up a region of several thousand square miles abounding in wealth. It is estimated that there are 1,500,000,000 feet of pine lumber in the vicinity which can be easily reached. A popular division of the railroad is the Lester Park Short Line. Lake Vermilion, on which the town lies, is 35 miles in length, and contains 371 islands. Its shores are irregular, and bordered with a forest of pines alternating with hills covered with verdure and wild flowers which overlook the Tower mines and the adjoining town. From Jasper's Peak there is a fine view of the Indian reservation on an island in the most picturesque portion of the lake, which the inhabitants still navigate in birch-bark canoes, sometimes formed of one piece of bark weighing 25 pounds. It abounds with fish, and in the woods on its banks are large and small game. A little steamer takes pleasure parties across its waters, which at sunset are of the color of vermillion.

A range of hills, bordering the southern shore of the lake, embraces some of the richest and most extensive deposits of iron ore in the world, discovered in 1880 by George C. Stone, of Duluth, Minn., and scientifically explored by Prof. Chester, of Hamilton College, the work of collecting the specimens employing two summers, and that of examination one winter.

Two Harbors, a town in northern Minnesota, on the shores of Agate Bay, 27 miles north of Duluth, population about 400. It is a popular pleasure-resort, has first-class hotels, a brick machine-shop, car-shop, foundry, round-house for locomotives, and an ore pier extending 600 feet into the bay, provided with 130 pockets, each with a capacity of 110 tons, making the dock-storage 14,300 tons. The docks of the Duluth and Iron Range Railroad received, in 1888, 30,000 tons of coal. The first cargo of iron ore from the Tower mines was shipped from the ore docks on Aug. 19, 1884, the shipments amounting that year to 62,124 tons. In 1885 the shipments reached 225,484 tons; in 1886, 300,000 tons; in 1887, 400,000 tons. In 1888, for the season to August 20, the shipments of iron ore were 185,000 tons as against 191,000 tons for 1887 to that date, and 185,000 tons for 1886 to the same day. Four acres of dock property are owned by the Elys to be used for shipping granite. An appropriation of \$10,000 has been made by the Government for a light-house. The town has a building association and has had a rapid growth. A steam-

boat runs daily to Duluth, and a large fleet of vessels is employed during the season along the lake-shore in trade or in pleasure excursions to that city, to Isle Royale, celebrated for its brook-trout fishing, and to the Apostle Islands. Within two miles of the town valuable copper mines are in process of development. It is proposed to inclose the bay by means of two breakwaters, one of which is partly finished, four hundred feet of it having been built at a cost of \$20,688; the entire cost is estimated at \$77,500. The bay is of vast importance to the iron interest, as the port is the place of shipment of ore from the great Vermilion mines at Tower and Ely. In 1886 an appropriation of \$22,500 was made by the Government for its improvement.

Vancouver, a seaport of recent origin on the coast of the mainland of British Columbia. It stands upon a gentle slope bordering English Bay and Coal Harbor, near the entrance of Burrard Inlet, an arm of the sea deeply indenting the mountainous coast, and furnishing safe anchorage for vessels of the deepest draught. The shore was covered with forests of trees, whose average height exceeded 200 feet, until 1885, when it was definitely settled that here should be built the terminus of the Canadian Pacific Railway. A town was then surveyed, systematic clearing began, and a settlement sprang up with great rapidity, anticipating the railway. A year later fire swept away the town, which has been rebuilt in a much more substantial manner, most of the business center being of brick or stone and exhibiting many fine structures. The terminal facilities of the railway and connecting steamship lines are extensive and complete, and the commerce is very large. A line of steamers plies between here and Yokohama and Hong-kong, under the flag of the Canadian Pacific Steamship Company, at intervals of about three weeks; and coast lines of steamers run daily to Victoria and the Puget Sound ports, and less frequently to San Francisco and Sitka. There is a large foreign trade by sailing-vessels, also, in lumber, squared timber, and merchandise, while the fishing interest is becoming profitable. An important jobbing and wholesale trade is carried on with interior towns and northerly coast-points; and the manufacture of spars and ship-timber, from the gigantic Douglas fir of the region, together with lumber and dressed articles, such as doors, sash, blinds, and cabinet-stuff, employs hundreds of workmen. All this has come into existence since the last census, and no precise figures are available. The town is now a city in organization and appearance. Its population approaches 6,000, and includes many persons of wealth, whose homes are costly and filled with modern appointments. A magnificent hotel is operated by the railway company, and the many opportunities for enjoyment and sport, the mild climate and wonderfully picturesque surroundings, attract tourists and sportsmen. The city is lighted by gas and

electricity, has public water-works, a uniformed police, and a paid fire department, hospitals, and public schools.

Victoria, a seaport at the southern extremity of Vancouver Island. It is the capital and largest city of British Columbia. It began forty years ago as a trading-station and *entrepôt* of the Hudson Bay Company. When the gold discoveries upon the upper Fraser river caused a rush to British Columbia, in 1858-'62, Victoria suddenly attained a population of 30,000, and it passed through a feverish season of business and inflated property-valuation. With the decline of the gold excitement this dwindled, but under the recent development of the province, due to the completion of the Canadian Pacific Railway and the growth of Alaska on the one hand, and the neighboring region around Puget Sound on the other, Victoria has advanced to a present population of 12,000. It has a beautiful site, and its mild climate is healthful, closely resembling that of the Devonshire coast of England. Beaconhill Park, overlooking the Straits of Fuca and the Olympic mountains, the beautiful grounds of Government House, and many fine suburban drives, make the place one of the most interesting in Canada. Three miles westward is the harbor and naval station of Esquimalt (pronounced Es-kwi-malt), which is the rendezvous of the British Pacific squadron. Here has just been completed a graving-dock costing \$450,000. Here and at Victoria English people and manners predominate, and the atmosphere of the place is in marked contrast to that of the American Pacific coast towns. Victoria has an immense shipping interest, and does a large business in naval supplies, general merchandise, coal, timber, and fish. The transpacific steamships from Vancouver to China and Japan touch here. A regular line plies weekly between Victoria and San Francisco, and fortnightly to Alaska. Daily steamers run to Vancouver, New Westminster, and the ports on Puget Sound. A railway runs thence up the eastern coast of the island to Nanaimo, where vast deposits of coal are mined, and agricultural and forest products are made available in large quantities. Victoria is growing steadily, and replacing the earlier structures with handsome and commodious business blocks. Banking, postal, and telegraphic facilities are of the best order. In addition to public schools, there are several private academies, and churches of every denomination. The Chinese, among whom are many wealthy merchants and contractors, form a large element in the population, but have not yet aroused that antagonism which meets them in the United States.

Winnipeg, the capital of Manitoba and commercial center of western Canada. It has a population of 30,000, and an assessment value of \$40,000,000. This city stands in the center of vast prairies, on the bank of Red river, at the mouth of the Assiniboine, its principal

tributary from the west. Both these streams are navigable by steamboats, though this method of transportation has been almost entirely superseded by railroads. Before 1870 the place was hardly more than a fortified post of the Hudson Bay Company, known as Fort Garry, the center of a small farming and hunting community of people, mostly half-breeds, called the Red River Colony. An insurrection among these led to the dispatch of an army thither, which made its way through the wilderness from Fort William, on Lake Superior, and subdued the malcontents. This was in 1870. The exploration and advertisement of the value of the region led to emigration there immediately afterward, and the people soon demanded railroad connection with the east. In 1879 a road was completed up the Red river, to connect with a line to St. Paul; and in 1883 the Government line, now incorporated with the Canadian Pacific, was opened between Winnipeg and Port Arthur, on Thunder Bay, the nearest harbor on the north shore of Lake Superior. Under this impetus, and because of a great influx of settlers upon the free prairies of Manitoba and westward, the city grew with extraordinary rapidity, and public and private enterprises were undertaken upon an immense scale. A second railroad to the United States was built, several local lines were constructed, and the Canadian Pacific pushed westward, reaching and crossing the Rocky mountains in 1885. Then came a succession of bad crops, a second insurrection of the half-breeds of the Northwest Territories, and a consequent cessation of immigration. Under this stress, Winnipeg's inflated prosperity collapsed, and a time of great discouragement and hardship ensued. From this it has now recovered, and business, re-established on a firmer foundation, is steadily advancing. "Notwithstanding all you have been told about it, you can hardly be prepared to find the frontier trading-post of yesterday transformed into a city of 30,000 inhabitants, with miles of imposing structures, hotels, stores, banks, and theatres, with beautiful churches, schools, and colleges, with tasteful and even splendid residences, with immense mills and many manufactories, with a far-reaching trade, and with all the evidences of wealth, comfort, and cultivation to be found in cities of a century's growth. . . . Situated just where the forests end and the vast prairies begin, with thousands of miles of river [boat] navigation to the north, south, and west, and with railways radiating in every direction, Winnipeg has become the commercial focus of the Canadian Northwest. . . . From there the wants of the people in the West are supplied, and this way come the products of their fields, while from the far north are brought furs in great variety." The buildings of the Provincial Government are commodious, but have little architectural pretension. They stand upon the bank of the Assiniboine, and are surrounded by growing trees. Opposite Win-

nipeg is the suburb St. Boniface, the seat of a Roman Catholic archbishop, where are convents, academies, and a theological school. The climate in Winnipeg is much like that of Minnesota, though rather more severe in winter. It is, however, healthful for most persons, and its winter rigors do not interfere with either business or pleasure.

COLOMBIA, an independent republic of South America. (For details relating to area, population, etc., see "Annual Cyclopædia" for 1886 and 1887.)

Government.—The President is Dr. Rafael Núñez, whose term of office will expire on Aug. 6, 1892. His Cabinet is formed of the following ministers: Of Government, Don Domingo Ospina Camacho; Foreign Affairs, Don Vicente Restrepo; Finance, Don Felipe Paul; War, Gen. Antonio B. Cuervo; Education, Don Jesus Casas Rojas; Treasury, Don Carlos Martínez Silva; Public Works, Gen. Rafael Reyes. The office of Vice-President has been abolished for the term of the present administration, and Gen. Eliseo Payan put on the retired list and pensioned.

The United States Minister at Bogotá is Dabney H. Maury, and the Colombian Minister at Washington is Don José Marcelino Hurtado. The Colombian Consul at New York is Don Climaco Calderon. The American Consul-General at Bogotá is John G. Walker; the Consul at Carthagena, William B. McMaster; at Colon-Aspinwall, Victor Viquain; at Medellín, William Gordon; and the Consul-General at Panama, Thomas Adamson.

Finance.—The statement submitted to Congress for the fiscal year 1888 by the Minister of Finance shows that to the external debt of £1,918,000, mostly held in England, there has to be added £806,000 accumulated interest. The internal funded debt amounts to \$5,087,000, while the floating debt, which consists of numerous commitments to railway and other enterprises, amounts to \$24,568,000. The total internal debt reaches, therefore, the sum of \$29,605,000. In addition, there is an issue of inconvertible paper money amounting to \$10,180,000. The revenue for the ensuing fiscal year is estimated at \$18,173,700, and the expenditure at \$23,852,800, showing a deficit of \$5,679,100.

The gross amount of duties collected at the Colombian custom-houses in 1887 was \$4,795,268, the expenses were \$300,951, leaving the treasury \$4,494,317 net proceeds. The custom-house at Barranquilla collected \$3,098,000; that at Carthagena, \$906,000; Cúcuta, \$327,000; Buenaventura, \$263,000, and Tumaco, \$75,000; none of the other custom-houses collected over \$50,000. By decree of June 13, the duties to be collected at Cúcuta, in the interior, on imports has been fixed at 25 per cent. to date from August 14.

Army.—The strength of the Federal army on a peace footing, for 1889 and 1890, has been fixed at 5,500 men, with their officers; in war-

time the States are bound to furnish a contingent of one per cent. of the population.

Commerce.—The following tabular statement shows Colombian trade with some of the leading commercial countries:

EXPORTS.			
YEAR.	United States.	England.	France.
1881	\$5,991,890	\$6,677,506	\$5,016,006
1882	4,961,470	5,452,281	5,968,696
1883	5,171,455	8,809,798	4,188,836
1884	8,891,848	2,108,588	4,288,606
1885	2,842,077	1,184,042	8,491,071

IMPORTS.			
YEAR.	United States.	England.	France.
1881	\$5,888,188	\$5,999,776	\$6,314,345
1882	6,408,846	5,296,660	5,959,346
1883	6,865,971	6,099,414	5,944,352
1884	6,881,521	5,944,571	7,169,408
1885	5,588,869	8,881,964	6,067,608

The United States' trade with Colombia in two years has been:

FISCAL YEAR.	Import.	Domestic export to Colombia.
1887	\$3,950,958	\$5,978,965
1888	4,898,258	4,928,259

Railroads.—At the annual election of directors of the Panama Railroad Company, held in New York on March 26, the president, J. G. McCullough, resigned, and his successor, Gen. John Newton, was installed. The former remarked on the occasion: "The road was bought in 1881 at \$290 net per share. Dividends as high as 10, 12, 16, 20, and 24 per cent. on the capital stock of \$7,000,000 have been paid. For the past year a little less than 9 per cent. was earned, and 6 per cent. was paid in January, leaving \$660,000 in the treasury. The company to-day has no floating debt, and there is not a suit against it pending in the United States. The physical condition of the property is about perfect. Since the riots and fires of 1885 the stations have been rebuilt of corrugated iron, and the equipment of rolling-stock is ample."

In March a railroad company, limited, was incorporated in London with a share capital of £172,000 for the purpose of purchasing and operating the El Dorado-Honda Railroad.

In May a Franco-Belgian company was formed with a capital of 2,500,000 francs, 2,400,000 francs paid in, for the purpose of obtaining concessions for railroads in Colombia, and building and operating them.

Simultaneously the National Government of Colombia approved the contract entered into by the State of Antioquia with O. S. Brown for the continuation and completion of the railroad between Puerto Barrio and Medellin, the capital necessary being \$6,000,000.

Steamer Lines.—Negotiations have been opened between the Government of the State of Panama and the Pacific Steam Navigation Company for the extension of its line to the

northern sections of Panama by the establishment of a tri-monthly service of light-draught steamers to run between Panama and Puerto Pedregal, in the province of Chiriquí, and the port of Sona, in the province of Veragua, a subsidy to be paid the company of \$700 for each round trip.

In April the steamer "Flamborough" left Colon for Kingston, Jamaica, being the pioneer ship of a new line between Colon, Jamaica, and Hayti.

In August it transpired that the West India Lloyd Steamship Company had given orders to build six steamers for the purpose of more rapidly transporting tropical fruits to New York and England. To this end, two of the steamers will ply between New Orleans and Savanilla, touching at intermediate ports and connecting at Trujillo with two other vessels of the line, which will run between New York and Livingston, Guatemala, Nassau, Jamaica, Trujillo, and the Island of Inagua, the nearest of the West Indian Islands to New York and Great Britain. The two largest and finest steamers will ply between London and Colon, touching at Plymouth, the Azores, and Jamaica, and connecting with the New York steamers at Inagua.

Telegraphs.—On February 15 Bogotá was united with Quito, the capital of Ecuador, by telegraph, and in June with Carthagena; at the same time telegraphic communication was established between Panama, Barranquilla, Carthagena, and Santa Marta, and a telephone company was making arrangements for establishing communication by telephone between Panama and Colon.

In October the Panama Railroad Company was authorized by the Government to send public messages over the wires of its line between Panama and Colon till the Government shall have constructed its own line.

Wagon-Road.—In May the government of the State of Bolívar opened the wagon-road from Tolú to Sinceljo. This road was built to bring the rich region of Sábana, Bolívar, in closer communication with the coast.

Mineral Resources.—Colombia contains numerous gold and silver bearing zones, and iron and copper, lead, zinc, antimony, arsenic, and cinnabar are to be found among the metals, while salt-beds abound, and sulphur, kaolin, and fire-clay are to be found. Cundinamarca and Boyacá are comparatively poor in gold and silver bearing lands if we except the Ariari and Guguaguí gold-beds, the silver-bearing copper-lodes of Tosca, the gold veins of Villa de Leiva and Loatá, and the gold washings in the beds of the Guataque and Cocuy. In the eastern ridge of the Cordillera, which separates Pamplona from Bucaramanga and covering a space of over fifty kilometres, the primitive formations are interspersed by gold and silver bearing ledges. Under the Spanish rule these reefs were worked. The wealth obtained from them is a matter of history, while

a visit to-day to those localities affords proof of the vast amount of labor that was expended to cut mountain-tunnels yet to be seen, some of which are from 50 to 500 metres in length. These main tunnels, opened in former days, measure about ten kilometres, and when one remembers that the rock cut through is granite and that the means of working were of a most primitive nature, it becomes evident that only rich returns would repay the labor required to overcome such obstacles. At Baya and Vetas thin quartz lodes are found. Here the richest leads are situated either horizontally or perpendicularly, a fact with which the old miners were well acquainted, as is proved by the manner in which they followed the lodes. These Baya and Vetas mines, or "Pamplona" mines, were abandoned after the declaration of independence, and although we know from periodical inspection that they contain great wealth, they are not worked any more than are the numerous reefs that are everywhere observable, which have never yet been touched by the miner's pick. In this region there is the old Santa Catalina mine, which was worked by an English company up to 1850 and abandoned as unprofitable simply because the process of amalgamation was defective, and not from the absence of good metal. The company had also at that time to contend against the decree that was issued prohibiting the exportation of the precious metals. At no great distance from Baya and Vetas rich gold washings have been formed by volcanic action and the wear and tear of ages and climatic influences on the sides of the mountains. Here the gold is found in a *detritus* composed of quartz, gneiss, mica, and iron; and from the beds of the Ematá and Giron, which wash through this formation, gold has been found for centuries. In the Bucaramanga gold washings the precious metal is found principally in scale and seldom as dust or nuggets, and it is owing to miners not having noted this fact that they have lost through defective apparatus the gold that otherwise would have well repaid them for their labors. The gold-washing machinery of to-day would save every grain that was then lost. Its quality is the best known, showing only .02 of silver to .98 pure gold. There are furthermore the Goajira and Rio Hacha alluvial deposits, the Tiqui quartz reefs, and the Porcé Sinú, San Jorge, and Uré sands. The reason of the failure of the Sinú company is clearly explained by the fact that the apparatus was inappropriate for working the kind of gold-ore that is found there. In Antioquia the Porcé and Neclín rivers may be mentioned as rich in gold for a distance extending over twenty-three leagues in length by fifteen leagues in breadth, and here a cubic metre of earth has produced one pound in weight of gold, while at Dos Bocas on one occasion one pound in weight of gold was obtained from only fifteen pounds of sand.

The Panama Canal.—Two important events have occurred in the history of the Panama Canal since the last annual meeting was held in Paris on July 21, 1887—the change of the canal from one at the sea-level to one with locks, and the issuing of a loan. M. Ferdinand de Lesseps, president of the canal company, and the board of managers during the latter part of 1887 came to the conclusion that a total change of system had become imperative, if the canal was to be dug within a reasonable time, thereby keeping the expense of accomplishing the work within certain limits. A contract was consequently made on Dec. 10, 1887, with M. Gustave Eiffel, an engineer of note, constructor of the gigantic tower for the Paris Exhibition of 1889, who undertook to construct such locks as the company would approve, on his submission of plans, with their working machinery, and to do such excavation and like work as may be necessary for the work of construction. It was expected that ten locks would be required; still the company reserved the right to postpone its decision as to the number of locks till April, 1889, allowing to M. Eiffel an extension of time for the completion of the two upper locks if the decision thereupon be not announced by Jan. 1, 1889. M. Eiffel engages to finish all the work stipulated for by June 30, 1890. His contract does not include the control of the Chagres river, nor any part of the canal work not immediately connected with the building of the locks and their operation when completed. Allowances of 88,200,000 francs were made M. Eiffel to enable him to get into a position to build the first four locks, 6,000,000 francs, however, being applicable to the second four. An extraordinary meeting of shareholders was held at Paris in March, and on this occasion M. de Lesseps said: "The direction of the canal with locks does not differ from the direction of the sea-level canal. This canal will have, in all its length, in each lock the same width and depth of water as the final canal. The largest vessels—those 150 metres long, and having a draught of 8 metres—will be able to pass in 1890 from one ocean to another. All our efforts are concentrated on the necessity of opening the canal for universal navigation with the greatest rapidity by absolutely sure means. After the inauguration, the yield of the transit taxes alone being 125,218,750 francs and all the expenses 108,926,260 francs, there will be a margin in round numbers of 21,000,000 francs to be distributed among the shareholders after deducting the reserve funds and the tenure to the Colombian Government." Over 1,000 shareholders were in attendance at the meeting; M. de Lesseps's report was unanimously approved, together with the resolution to make a loan of 840,000,000 francs. The report estimated the amount requisite for finishing the canal at 654,000,000 francs, 254,000,000 being necessary to pay for excavation, 125,000,000 for locks and masonry,

15,000,000 for reservoirs for the feeding of the upper portion of the canal, 50,000,000 for material, and 210,000,000 for the covering of general expenses and the interest on bonds and shares. The French Chamber of Deputies passed the Panama Canal Lottery Loan Bill without Government guarantee early in May, and the Senate in June. The bill provided for the issue of 600,000,000 francs in bonds, the numbers to be drawn after the manner of a lottery twice a year, and the winners to receive premiums of various amounts. It also provided 20 per cent., or 120,000,000 francs, to be set aside in French *rentes* for the payment of prizes, and to serve as a sinking-fund. On June 27, 360,000,000 francs, being half the amount authorized, were offered for subscription with a lottery scheme including three annual prizes of 500,000 francs each, and three of 250,000 francs; furthermore six of 100,000 francs, there being six drawings per annum, distributing altogether 8,890,000 francs yearly till the year 1918, beginning with which 2,200,000 francs per annum will be drawn for in four drawings and embracing two prizes of 500,000 francs each, two of 250,000 and four of 100,000, the minor lots ranging between 1,000 and 10,000 francs. Bonds were issued having a face value of 400 francs, payable by lots or at 400 francs within 99 years by a special deposit of French *rentes*, and offered at 360 francs, bearing 15 francs per annum interest. Out of the 2,000,000 bonds offered, 860,000 were sold. At the first drawing the large prizes were taken by bonds that had not been sold, to the great disappointment of subscribers, the company therefore decided that at the October drawing all the prizes should be given to the 860,000 bonds that had been sold; it was compelled to take this course by the dissatisfaction of the bond-holders.

At the time of making the contract with M. Eiffel, the plan of eight locks was adopted. On their departure from the Atlantic Ocean the vessels would at first encounter two locks of 8 metres fall each, subsequently two of 11 metres each, the length of the lock-chambers being 180 metres. Hence the altitude overcome would be 88 metres. The difference between the latter and the total height of the mountain-range was to be overcome by excavations. On the west side three locks of 11 metres fall were to be built and one of 8 metres fall. The difference of 8 metres is necessary on account of the lower level of the Pacific Ocean at low tide. Subsequently, in May, it was deemed advisable to modify the plan by building ten locks instead of the eight alluded to, lock 1 to be located at Bohio Soldado; 2, at San Pablo; 3, at Matachin; 4, at Obispo; 5, at Emperador—all on the Atlantic side; 6, at Cucaracha; 7 and 8, at Paraiso; 9, at Pedro Miguel; and 10, at Miraflores—all on the Pacific side. There are to be three locks of 11 metres fall, and two locks of 8 metres fall on each end of the canal—that is, on the Atlantic and Pacific sides of the center of the canal.

The canal, through its entire length, is to have the same depth as the eventual sea-level canal, but through the adoption of the canal with locks, the excavation yet to be done is limited to from 34,000,000 to 40,000,000 cubic metres. But the construction of the locks alone will not suffice; the main point is the feeding of those works. For the latter purpose embankments have to be made in connection with the rivers Chagres, Obispo, and Rio Grande, the former of which alone is capable of furnishing per second 10 cubic metres of water, which it is estimated would suffice for the passage through the locks of ten vessels, of a joint tonnage of 20,000, per diem. The total amount of excavation actually accomplished in 1886 had been 11,727,000 cubic metres; during the first nine months of 1887 it was 9,877,000.

In August 250,000 hectares of land in Colombia were transferred to the canal company under the contract made by the company with the Government. Nathan Appleton, who was sent by the United States Government as a delegate to the international congress held in Paris, in 1879, to decide as to the route that should be adopted, and has been connected with the enterprise from its beginning, being asked his opinion about the change of plan, said the adoption of the lock system was the only thing that remained to assure success.

The Panama Canal Company, late in November, resolved to offer for public subscription on December 10 the 1,140,000 unsold lottery bonds; but the shares declined so rapidly that it became evident the subscription would result in failure. M. de Lesseps and his colleagues resigned, and at their request the Tribunal of the Seine appointed Messrs. Hue, Bancelot, and De Normandie to settle the company's affairs. On December 6 the company's shares had dropped to 175, and on December 17 they fell to 98.75 francs, recovering 12 francs next day.

Ice Monopoly at Panama.—On March 1 the sole right to manufacture, import, and sell ice in the Department of Panama was sold at Bogotá, at the Ministry of the Treasury, the buyers to pay \$45,000 a year in advance for the privilege, in silver coin of 0.885 fineness. The exclusive privilege thus granted runs fifteen years, but work must begin in ten months. At the expiration of the concession the manufactories will become Government property.

Registration of Companies.—The following law was signed by President Núñez on May 25:

ARTICLE I. All firms or companies formed outside of Colombia, which carry on a permanent business within its territory, shall register their deeds of partnership or charters in the notary's office of the district where they intend doing business.

ART. II. Such companies or firms will not be considered to have been legally established, nor will they be able to claim the protection of the law, if they have not previously been duly legalized by the Executive. For this reason those companies or firms will be considered to have been dissolved which, up to the present date, have not been legalized in the manner herein provided or do not obtain such legalization within six months from date.

Art. III. All firms and companies shall have a duly legalized representative, with a fixed place of abode.

Art. IV. Should any company not appoint a representative, then the President of the republic will appoint some one to represent the company, and such nominee will enjoy the rights and privileges appertaining to the place when filled by any one appointed by the firm or company.

Art. V. The present law in no way affects the Panama Inter-oceanic Canal Company, which will continue to be ruled solely by the existing treaties and contracts.

Foreign Relations.—The message of President Nuñez, delivered at the opening of Congress on July 20, said: "An extradition treaty has been signed with the United States; it had been rendered necessary by the exceptional state of affairs that now exists on the Isthmus of Panama in consequence of the extraordinary influx of foreigners to the Isthmus. The Cerruti question was submitted to arbitration, and was decided by the Government of Spain, which will also decide on the boundary question now pending with Venezuela. Until that decision is reached, Venezuela and Colombia will respect the *status quo* which has existed up to date. The boundary question with Costa Rica will also be decided by Spain, and thus a possible conflict between the two countries prevented. On Sept. 7, 1887, the Government declared its intention to abrogate clauses 10, 11, and 23 of the commercial treaty with Ecuador, the abrogation to take effect July 7, 1888, when those clauses providing for mutual concessions to imported produce of the two countries will become void."

The Extradition Treaty.—The extradition treaty referred to in President Nuñez's message was signed in Bogotá May 7 last by Señor Vicente Restrepo, Minister of Foreign Affairs of Colombia, and John G. Walker, *Chargé d'Affaires* of the United States, and received the sanction of the National Legislative Council on May 25.

which is stipulated in the request for his extradition. Article VII provides that if the accused is not proved guilty within three months he shall be set at liberty. Article X says that neither of the contracting parties undertakes to hand over its own citizens for trial by the other. By Article XI the fact that the accused may be liable to other charges shall not be held to debar him from extradition. One year's notice of the annulment of the convention must be given.

COLORADO. State Government.—The following were the State officers during the year: Governor, Alva Adams, Democrat; Lieutenant-Governor, Norman H. Meldrum, Republican; Secretary of State, James Rice, Republican; Treasurer, Peter W. Breene, Republican; Auditor, Darwin P. Kingsley, Republican; Attorney-General, Alvin Marsh, Republican; Superintendent of Public Instruction, Leonidas S. Cornell, Republican; Railroad Commissioner, A. D. Wilson; Chief-Justice of the Supreme Court, William E. Beck; Associate Justices, Joseph C. Helm and S. H. Elbert, who resigned in August. Gov. Adams appointed M. B. Gerry to hold the place made vacant by Judge Elbert until a successor should be elected in November, when Victor A. Elliot was chosen. At the same election Charles D. Hayt was chosen to succeed Chief-Justice Beck at the close of his term.

Population.—By the census of 1880 the number of people in the State was 194,827; in 1885 there were, according to the State census of that year, 243,910 people. Upon the basis of the school census of this year, it is estimated that there were 350,000 people in the State at the date of the census in April.

Education.—The following statistics, compiled by the Superintendent of Education, indicate the growth of the public schools during the past two years:

ITEMS.	1887.	1888.	Increase.
Number of districts.....	779	990	211
Total school population.....	63,216	76,212	11,229
Enrolled in high-schools.....	1,180	1,158	22
Enrolled in graded schools.....	24,471	27,986	3,515
Enrolled in ungraded schools.....	17,900	21,806	4,906
Enrolled in public schools.....	42,901	50,745	7,844
Average daily attendance.....	27,147	31,516	4,369
Number of school-houses.....	686	820	134
Value of property.....	\$2,492,701	\$3,238,021	\$745,320
Expended for buildings, sites, and furniture.....	\$193,257 39	\$304,771 16	\$111,488 27
Total expenditures.....	\$465,028 76	\$1,152,411 78	\$287,388 02
Expenditure per capita of school population.....	\$13 28	\$15 12	\$1 96
Expenditure per capita of enrollment.....	\$20 16	\$23 71	\$2 75

It provides for the extradition of persons accused of murder or attempt at murder, of counterfeiting, forgery, fraudulent disposal of public funds, robbery, burglary, where attended with violent entry of a public or private place, perjury or subornation of perjury, rape, arson, piracy, the destruction of railroads, tramways, or any construction the injury of which would involve danger to life. Article V provides that no one accused of political crimes shall be handed over on any other charge than that

The Capitol.—The Legislature of 1885 passed an act providing for the erection of a State capitol building at Denver, and creating a board of capitol managers to superintend the work. A contract was made by the board for constructing the foundation, and in July the work under this contract was substantially completed. Preparations were made during the latter part of the year for beginning the superstructure, which is to be largely of sandstone from quarries at Gunnison.

Railroads.—The following statistics show the mileage of railroads in the State in November:

	Miles.
Denver and Rio Grande	1,487
Union Pacific	1,273
Atchison, Topeka, and Santa Fé	471
Burlington and Missouri	845
Colorado Midland	250
Missouri Pacific	175
Denver, Texas, and Gulf	147
Denver, Utah, and Pacific	65
Denver and Santa Fé	6
Chicago, Rock Island, and Pacific (estimated) ..	250
Total	4,518

The Denver, Texas, and Gulf Road to Fort Worth, Tex., was completed early in the year, giving direct communication from Denver to the Gulf of Mexico. If the Federal Government can be induced to construct a suitable harbor on the coast, this line will prove of great value in the development of Colorado. Another road, completed later in the year, was the Rock Island and Pacific, to Colorado Springs. Various branch lines were also in process of construction.

Stock-Raising.—In Colorado, as in other parts of the Western plains, the cattle industry is gradually changing in character and methods. A Colorado journal says: "The plains in the eastern part of the State which, less than a dozen years ago, were covered with cattle, are being rapidly settled and only the poorest range is left. A striking illustration of this fact is found in Pueblo County. The range cattle are being shipped out of that section of the country, some to the ranges in the western part of the State and some east to Kansas and Nebraska. It is only a question of time when the ranges in the western part of the State will be settled also, and the herds compelled to move again. But it will only be changing the business from the control of a few into the control of many. There are large portions of the mountainous parts of the State that will be utilized as ranges, but they will accommodate a comparatively small number of cattle. The system will be entirely changed, and while the altitude in many parts of the State will prevent the raising of corn in such abundance as in Kansas and Nebraska, other fodder can be raised in as great abundance and so much cheaper that Colorado cattle-raisers can compete with those of any other portion of the country. That this can be done in Eagle County has been demonstrated, and land which, a few years ago, was deemed worthless for farming, because of the altitude, is now yielding large profits."

The Utes.—The people of the State have long desired to rid themselves of the presence of these Indians, who have several times threatened the public safety. By an early treaty with the United States, they were separated into three reservations, known as the White River, Uncompaghe, and Southern Ute reservations. In 1879, when the Meeker massacre occurred, the Government made a new treaty, which resulted in the removal of the White

River and Uncompaghe Utes to the Uintah Reservation in Utah. But the refusal of Colorado and his band to remain in Uintah, and their annual return to Colorado for fishing and hunting, finally led to trouble with his band last year, when they were driven back to Utah by the Colorado State troops.

As a consequence of this disturbance, and through the efforts of Colorado citizens, a bill was passed by Congress this year, providing for a commission to treat with the Southern Utes, the only remaining band in the State, and to procure their removal to southern Utah. The commissioners appointed in July under this act were T. C. Childs, of Washington, R. B. Weaver, of Arkansas, and J. Montgomery Smith, of Wisconsin. They reached the Ute reservation in August and spent several months in negotiation, during which, with several Ute leaders, they visited southern Utah with a view of selecting the proposed reservation. They were finally successful in the object of their mission, the Indians having consented to the removal. A tract of about 1,190,000 acres will be thereby opened to settlers in the State.

Insurance.—The sixth annual report of the Insurance Commissioner, for the year ending in May, estimates that new risks were taken during the year against fire amounting to \$50,619,776, and upon life amounting to over \$8,000,000. This business was done almost entirely by outside companies. "The record heretofore made by Colorado companies," says the commissioner, "has been indifferent, and in some cases positively bad. There has been bad faith in many of them from their very inception."

The Deep-Water Harbor Convention.—Early in July a convention, composed chiefly of Texans, with a few representatives from Colorado and Kansas, was held at Fort Worth, Tex., for the purpose of promoting a movement to secure a deep-water harbor on the Gulf coast. The convention adopted resolutions of which the following is an extract:

It is the sense of the convention that the commercial, agricultural, mining, and stock-raising interests, not only of Texas, but of all the territory north and west thereof, as well as the commerce and trade of the United States with other countries, demand a first-class port on the coast of Texas.

This convention believes that such a port ought to be selected by a board of competent engineers appointed by the United States Government.

The remainder of the resolutions urge upon Senators and Representatives in Congress the need of appropriations for this work. It was also voted to recommend a second convention to be held in Denver at an early date, which should include representatives from all the States and Territories west of the Mississippi. Pursuant to a proclamation by Gov. Adams, this convention assembled at Denver on August 28, and remained in session several days. Delegates were present from nearly all the States and Territories embraced in the call, except from the Pacific States. Gov. Thayer, of

Nebraska, was chosen permanent chairman, and ways and means of securing the objects of the meeting were discussed at length. A difference of opinion prevailed as to whether Galveston or some other port on the coast should be designated for improvement. Two reports were submitted by the committee on resolutions, of which the majority report, recommending no particular harbor, was adopted.

On October 17 a committee appointed by the convention met at Dallas, Tex., adopted a draft of a bill to be presented to Congress, and took measures to secure its early consideration by that body.

Political.—Both the Union Labor party and the Prohibition party met in State convention at Denver on September 1. A conference committee was selected by each convention to agree upon a fusion ticket, but the refusal of the Union Labor men to ratify the ticket so agreed upon, brought the plan to naught. The Union Labor men nominated a State ticket headed by De La Martyr.

The Prohibition nominees were: For Governor, W. C. Stover; Lieutenant-Governor, Warren R. Fowler; Secretary of State, W. W. Waters; Treasurer, Harry G. Schoock; Auditor, W. A. Rice; Attorney-General, J. H. Boughton; Superintendent of Schools, J. A. Smith; Supreme Court Judge (long term), A. W. Braze; Supreme Court Judge (short term), D. E. McCaskell; Regents of the State University, Isaac T. Keator, D. W. Robbins.

On September 4 the Republican State Convention met in Denver. There were five candidates for the gubernatorial nomination, each having upon the first formal ballot the following support: David H. Moore, 181 votes; Job A. Cooper, 122; Ex-Senator H. A. W. Tabor, 186; Wolfe Londoner, 84; Lieutenant-Governor Meldrum, 74. On the fifth ballot Job A. Cooper was nominated. The remainder of the ticket was completed as follows: For Lieutenant-Governor, William G. Smith; Secretary of State, James Rice; Treasurer, W. H. Brisbane; Auditor, Louis B. Schwanbeck; Attorney-General, Samuel W. Jones; Superintendent of Public Instruction, Fred Dick; Regents of the State University, Charles R. Dudley, S. A. Giffin; Supreme Court Judges (long term), Charles D. Hayt; (short term), Victor A. Elliott.

Resolutions were adopted ratifying the work of the National Convention and favoring liberal pensions, anti-Chinese legislation, a fair ballot, and free coinage of silver. On State questions the platform declares as follows:

We favor fair but stringent legislation respecting the railways in the State. We declare that pools, rebates, and all discriminations should be prohibited, and the prohibition rigidly enforced by heavy penalties. We also demand legislation that will prevent the charging of exorbitant rates. We also demand legislation prohibiting all officers, judicial, legislative, and executive, from accepting, directly or indirectly, railway-passes or free tickets.

We also declare in favor of stringent State and national legislation prohibiting trusts and combinations of every kind and nature.

While we uphold the National Government in all its endeavors to preserve the public domain for the benefit of honest settlers, we must earnestly condemn the course pursued by the present Administration in its wholesale attempt to cancel and annul pre-emption and homestead entries at the instance of land-agents, thereby tyrannically and dishonestly taking from poor but honest settlers their money and homes.

That the Legislature enact laws providing for the protection of the health and safety of those engaged in mining and other hazardous occupations.

That the lien-law of the State be so amended as to secure to the laborer wages earned by him, and prevent his being defrauded of them by dishonest practices at the hands of unscrupulous persons.

We favor a liberal appropriation by the State Legislature for the purposes of inducing immigration and advertising the resources of the State.

We urge our congressional delegation to continue their efforts to secure all legislation necessary to perfect a system of reservoirs in the Rocky Mountains for irrigation purposes.

A resolution was also passed urging such legislation as would permit the surplus of \$1,000,000 of current funds in the State treasury to be applied in payment of the State debt.

The Democratic State Convention assembled at Denver on September 19, and nominated the following ticket without a contest: For Governor, Thomas M. Patterson; Lieutenant-Governor, John A. Porter; Treasurer, Amos G. Henderson; Secretary of State, W. R. Earhart; Auditor, Leopold Meyer; Attorney-General, J. M. Abbott; Superintendent of Public Instruction, J. A. Hough; Regents of the University, F. A. Chavez, Charles Ambrook; Judges of the Supreme Bench (long term), M. B. Gerry; (short term), A. J. Rising.

The platform ratifies the acts of the National Convention, favors free coinage of silver, denounces trusts, and discusses State questions at length as follows:

We demand that all reservation of public lands in Colorado not absolutely necessary for the uses of the Government shall be thrown open for occupation and settlement; and we pledge ourselves to the people to use all available means to secure that end and to secure to all *bona-fide* settlers now on said reservations their rights.

The existing laws of the United States with regard to the public timber domain are emphatically condemned, and we charge the Republican party with responsibility for the same. By these laws, as construed and enforced by the courts, railway companies are given unlimited and unrestricted right to denude the public domain of its best timber, while the privileges given to private citizens with regard to taking timber for necessary purposes are so restricted as to practically deny them its use.

We deplore the evils of alien landlordism everywhere, and especially sympathize with those on the borders of our State who are suffering from its pernicious effects, and we demand the enactment of such Federal and State legislation as will give relief to our suffering fellow-citizens and prevent its further extension. We favor the passage of a law establishing a board of mediation and arbitration, with power to inquire into and adjust all disputes arising between employer and employé, to be created as is provided by the laws of the State of New York on that subject, and embodying the recommendations of President Cleveland to Congress on April 22, 1886.

We demand that the funds of the State Treasury, instead of being used to create perquisites for the Treasurer's office, shall be placed at interest, under

regulations and safeguard to be provided by law, whereby such interests shall be added to such funds and become a part thereof, and we pledge all of our candidates for the Legislature to the enactment of such a law.

Being opposed to all unnecessary taxation, either direct or indirect, we repudiate the proposed amendment to our State Constitution, which is intended to increase the rate of State taxation, and call upon the people to aid us in defeating it. The proposed increase results from Republican extravagance, continued by that party in disregard of its pledges, the expenses and appropriations for the last General Assembly having been above \$500,000 for each of the years 1887-'88, exclusive of appropriations for the capitol building.

We again denounce the payment of county, precinct, and court officers by a system of exorbitant fees, and again demand that their compensation shall be fixed by salary and paid at stated intervals.

We favor the passage of a law concerning elections which shall embody the best features of the Californian and Australian systems.

We reiterate the sentiments of our past platforms concerning the necessity of legislation which will more effectually regulate and restrain all lines of transportation, rebates, overcharges, discriminations against individuals and localities, fictitious capitalization, and disregard of constitutional checks, which will continue until such legislation and the establishment of a board of commissioners, with ample power to inquire into and correct abuses and to fix and enforce uniform maximum rates for freight and passenger traffic, and we pledge all our candidates on the State and legislative ticket to its enactment. We propose no legislation that can affect the rights of railway companies, to cripple or injure them, but we insist that the rights of individuals and localities must be protected and preserved. We denounce the majority of the Senate of the last General Assembly which defeated the will of the people by preventing such legislation, and we commend the House of Representatives for its gallant but ineffectual effort to protect and secure the rights of the people.

We heartily indorse the proceedings of the late Interstate Deep-Water Harbor Convention of Denver, and pledge the nominee of this convention for Congress to do all in his power, if elected, to secure the establishment of ample harbor facilities on the Texas coast.

The necessity of a reservoir system, by means of which our surplus waters can be stored and utilized for agricultural and kindred purposes, is constantly increasing, and we promise to labor for the ultimate accomplishment of this object.

We believe in the encouragement of free and intelligent immigration to this State, and favor the passage of a law creating a bureau of immigration to be composed of the Executive Department without additional salary.

Foreign contract labor and Chinese immigration are the product of Republican administrations. We denounce them both, and earnestly recommend the enactment of such further legislation as is essential for their complete destruction.

We are opposed to the further sale of our school-lands, and demand an investigation of the manner in which said lands have heretofore been disposed of.

After an energetic canvass, the Republican State and national ticket was successful in the November election, by pluralities ranging from 10,000 to 14,000. Only one of the forty-two counties in the State returned a Democratic plurality. A Republican Congressman was elected, and the next Legislature will be Republican. The people voted at the same election upon the question whether the rate of taxation

for State purposes for 1889 and 1890 should be increased from four to five mills, and also upon two amendments to the State Constitution—one permitting county indebtedness within certain limits, the other modifying the clause forbidding a State debt, and especially providing that a loan of \$600,000 may be contracted to meet obligations of the State outstanding on Dec. 31, 1888. All of these propositions were defeated.

CONGO FREE STATE, a country in equatorial Africa, constituted by the general act of the Congo Conference, which was signed at Berlin, Feb. 26, 1885. The boundaries of the state were defined by conventions made by the International Association of the Congo with Germany on Nov. 8, 1884, with Great Britain on Dec. 16, 1884, with the Netherlands on Dec. 27, 1884, with France on Feb. 5, 1885, and with Portugal on Feb. 14, 1885. The powers reserve for a period of twenty years the right of deciding whether freedom of entry shall be maintained or not. The navigation of the Congo is placed under an International Commission representing all the powers signing the act. By a vote of the Belgian Legislature, April 28 and 30, 1885, the Free State was placed under the sovereignty of King Leopold II individually, the Belgian Government having no power or responsibility in relation to it.

The Governor-General is M. Ledeganok, under whom are chiefs of provinces and other officials. There are four administrative divisions or provinces: the Lower Congo, Livingston Falls and the Pool, the district between the Pool and the equator, and the Upper Congo. The principal stations occupied are Banana, Boma, Matadi, Lukunga, Leopoldville, Bangala, Stanley Falls, and Luluabourg. Stanley Falls, which had been abandoned in consequence of Arab attacks, was reoccupied in 1888 by officers of the Free State. Tippoo Tib, who has been the most prosperous of the Arab slave raiders in this region, having his seat at Nyangwe, had for some time previous acted as temporary chief of the station, and received a salary for maintaining order. The Central Government at Brussels consists of the King of the Belgians, and three heads of Departments—Foreign Affairs and Justice, Finance, and the Interior.

Area and Population.—The state includes a small section on the north bank of the Congo, from its mouth to Manyanga, French territory intervening between this last station and the mouth of the Likona, whence the boundary extends northward to 4° north latitude, eastward to 30° east longitude, southward to Lake Bangweolo, 12° south latitude, westward to 24° east longitude, northward to 6° south latitude, then westward to the south bank of the Congo at Nokki. The area of the Free State is estimated at 1,056,200 square miles, with a population of about 27,000,000. There is an army of 2,000 native Africans.

Finance.—The revenue is derived from a subsidy granted by the King of the Belgians. The expenditures are estimated at \$850,000.

Commerce.—The chief articles of export are palm-oil, ivory, India-rubber, coffee, gum copal, peanuts, orchil, and cam-wood. The principal imports are cotton cloth, gunpowder, spirits, and tobacco. The rubber exported in 1887 was valued at 2,000,000 francs; ivory, 1,500,000 francs; coffee, 1,497,000 francs; peanuts, 701,870 francs; palm-oil, 648,560 francs. The total exports were about 7,000,000 francs, and the imports of equal value. By a decree that was published in November, 1888, the transport and sale of firearms and ammunition is prohibited on the Upper Congo and its tributaries. The survey for a railroad from the coast to Stanley Pool has been completed. The line is to run from Matadi to Stanley Pool, 350 kilometres, starting at a level of 7 metres above the sea, and gradually rising to 60 metres.

The French Possessions.—The French acquisitions in the Congo region, about 250,000 square miles in extent, have not yet been commercially developed. The frontier question between France and the Free State was finally settled in the summer of 1888 by the evacuation of the post of Kundja that the French occupied on Ubangi river.

CONGREGATIONALISTS. Statistics.—The following is a summary of the statistics of the Congregational churches in the United States, as they are given in the "Congregational Year-Book" for 1888. The additions, removals, and gains cover a period extending in several of the States to two years, and in others to various fractional parts of more than one year:

Churches, whole number.....	4,404
Members, whole number.....	457,584
Members added on confession.....	41,156
Members, gain (actual, comparing totals).....	31,305
Baptisms, adult.....	20,123
Baptisms, infant.....	11,966
Families reported.....	268,775
Sunday-schools, members.....	551,691
Sunday-schools, gain in members.....	29,704
Sunday-schools, average attendance.....	824,719
Sunday-schools, united with the Church from.....	18,399
Sunday-schools, benevolent contributions of.....	\$162,013

BENEVOLENT CONTRIBUTIONS OF THE CHURCHES.

For the year 1887 only.....	\$2,095,485
Of which for foreign missions.....	819,404
Of which for education.....	321,237
Of which for church building.....	122,590
Of which for home missions.....	456,577
Of which for A. M. A.....	151,698
Of which for Sunday-schools.....	23,986
Of which for New West.....	43,960
Of which for ministerial aid.....	9,133
Of which for other objects.....	737,731
Legacies paid.....	329,663
Home expenditures.....	5,078,950
Home expenditures, increase.....	1,169,755

The seven theological seminaries of Andover, Bangor, Chicago, Hartford, Oberlin, Pacific, and Yale, returned in all 46 professors, 21 instructors or lecturers, 23 advanced or graduate students, and 420 undergraduate students.

The American Congregational Association has for its object to preserve, improve, and

promote the best use of the Congregational Library; to care for the Congregational House (in Boston), and remove the incumbrances upon it; and to further the general interests of Congregationalism. It owns the Congregational House, which is valued at about \$425,000 and is liable in funded obligations of \$184,500. The Library includes 84,000 volumes and more than 140,000 pamphlets, and is housed in a fire-proof structure.

Educational Societies.—The receipts of the American College and Education Society for the year ending April 30, 1887, were \$57,994. Two hundred and ninety-one students were assisted during the year, and 7,237 since 1816. In both departments, of aid to colleges and assistance to students fitting for the ministry, the society had a large agency in social organization throughout the West.

The New West Education Commission seeks to promote Christian civilization in Utah and adjacent States and Territories by the education of children and youth and other kindred agencies. Its total income for the year ending July 1, 1887, was \$61,318, or \$3,956 more than the receipts of any previous year; and its indebtedness was returned at \$10,000, \$5,000 having been paid off during the year. It had sustained 28 schools of all grades, with which 59 teachers and 2,383 pupils were connected. It had erected four new buildings and had made additions to two others, at a total cost of \$30,475.

American Congregational Union.—The thirty-fourth annual meeting of the American Congregational Union was held in New York city, January 12. The Rev. Dr. William M. Taylor presided. The date of closing the financial year having been changed from April 30 to December 31, the report was for only eight months. The total receipts for this term had been \$81,200, which, with \$48,394 in the treasury on May 1, appropriated but not called for, made the total available resources for the year 1887 \$129,584. The total expenditures for eight months had been \$85,031; and there remained in the treasury, mostly of moneys appropriated but not paid, \$129,595. Grants of \$45,008 had been made to 59 churches, and loans of \$13,650 to 17 churches, 3 churches receiving both grants and loans; 35 parsonages had been added, at an average cost to the Union of \$347, making a total of 140 parsonages completed under the auspices of the Union, while 19 more were in building. The report of the treasurer showed that \$102,223 had been contributed back by the churches that had been aided by the Union during its career, and \$76,704 had been returned on loans, insurance on buildings burned, and houses sold. It was thus shown that "the only difference between a loan and a grant is the time allowed for payment." All aid from the Union is in the form of temporary relief. The aided churches reported additions by profession of 8,213 members.

American Home Missionary Society.—The sixty-second annual meeting of the American Home Missionary Society was held at Saratoga Springs, N. Y., June 5. The Rev. Dr. Julius H. Seelye presided. The entire resources of the society for the year had been \$550,886, and the whole amount paid to missionaries had been \$511,641. There were still due to missionaries for labor performed \$1,559, and the appropriations already made and daily becoming due amounted to \$78,895, making the total amount of pledges \$79,955. Twenty State organizations of women, with 1,100 local auxiliaries, were co-operating with the society. Fifteen hundred and eighty-four ministers had been employed during the year, or some part of it, in the supply of 3,084 congregations, of whom five had preached to colored people, and 144 in foreign languages, viz., to Welsh, German, Scandinavian, Bohemian, Spanish, Chinese, Indian, French, and Mexican congregations. These missionaries reported that 180 churches had been organized, and 59 had become self-supporting; that 116 houses of worship had been completed, 15 chapels built, 38 parsonages provided, and 6,310 members had been added on confession of faith during the year. Eighty-seven persons connected with the missionary churches were preparing for the ministry. The number of Sunday-schools under the care of the missionaries was 2,205, and with these were connected about 180,000 pupils. Two hundred and eighty-eight new schools had been organized. The contributions to benevolent objects reported by 786 missionaries amounted to \$35,641.

American Missionary Association.—The forty-seventh annual meeting of the American Missionary Association was held in Providence, R. I., beginning October 25. The Rev. William M. Taylor, D. D., presided. The total receipts, including the balance from the previous year, had been \$328,147, and the expenditures had been \$328,788. The whole number of schools sustained by the association was 93, 20 of which were normal schools. It was estimated that of the 15,000 negro teachers in the South, educating 800,000 pupils, 13,500 had become teachers from missionary schools, and more than 7,000 of them from the schools of this association. The normal schools are situated at Wilmington, N. C., Charleston and Greenwood, S. C., Atlanta, Macon, Savannah, Thomasville, and McIntosh, Ga., Mobile, Athens, and Marion, Ala., Memphis, Jonesboro', Grand View, and Pleasant Hill, Tenn., Lexington and Williamsburg, Ky., Santee Agency, Neb., and Oahe and Fort Berthold, Dakota. The association provides also the teaching-force at the Ramona Indian school, Santa Fé, New Mexico, and normal departments were connected with six of the colleges. Four new churches had been organized during the year. The following are the statistics of the schools, exclusive of the normal schools, and of church work:

SCHOOLS.

ITEMS.	In the South.	Indian schools.	Total.
Number of schools.....	58	18	76
Number of instructors.....	266	50	316
Number of pupils.....	9,896	560	10,476
Theological students.....	87	..	87
Law students.....	73	..	73
College students.....	68	..	68
Preparatory-college students....	105	..	165
Normal students.....	836	10	846
Grammar-grade students.....	1,996	48	2,039
Intermediate-grade students....	2,995	108	3,106
Primary pupils.....	3,881	419	4,300

There are, in addition, 17 Chinese schools on the Pacific coast, with 39 teachers.

CHURCH WORK.

ITEMS.	In the South.	Indian schools.	Total.
Number of churches.....	131	5	136
Number of missionaries.....	102	13	115
Number of church-members.....	8,065	397	8,462
Added by profession of faith.....	721	30	750
Scholars in Sunday-schools.....	16,093	1,091	17,114

Thirteen woman's State organizations were co-operating with the association. A gift of one million dollars to the work of the association, from Daniel Hand, of Clinton, Conn., was announced and acknowledged with an expression of thanks. The fitness of the colored people of America to carry on missionary work in Africa was discussed affirmatively by the Rev. Dr. Strieby, secretary of the association, in a paper on "American Freedmen and African Colonization." Among the other papers read was one on "The Hopefulness of Indian Missions," by Secretary Beard.

American Board.—The seventy-ninth annual meeting of the American Board of Commissioners for Foreign Missions was held at Cleveland, Ohio, beginning October 2. The Rev. Richard S. Storrs, D. D., presided, and was re-elected president for the ensuing year. The receipts of the year from gifts had been \$894,568, being \$27,610 more than the like receipts of the previous year, and \$9,687 more than the average for the past five years. Of this amount \$152,510 had been contributed through the four Woman's Boards (Woman's Board of Missions, Woman's Board of the Interior, Woman's Board of the Pacific, and Woman's Board of the Pacific Isles). The receipts from legacies had been \$146,353. Adding to these two classes of receipts the income from permanent funds, \$11,258, the total income of the society for the year had been \$552,179, or \$73,735 more than the total income of the previous year. The sum of \$62,500 had been appropriated from the "Swett fund," which had been set apart to meet special calls, chiefly for use in China and Japan, and \$51,082 from the "Otis bequest," set apart for new missions, for the work in West Central and East Central Africa, Hong-Kong, northern Japan, and North Mexico. The total expenditures, including these appropriations, had been \$666,-

899: There had also been received and expended for the relief of suffering, occasioned chiefly by famine in central Turkey, \$31,695. The following is the General Summary of the Missions of the Board in Asia Minor, China, Africa, the Pacific Islands, Mexico, Spain, Austria, European Turkey, India, Ceylon, and Japan:

GENERAL SUMMARY, 1867-1888.

Missions.....	23
Stations.....	90
Out-stations.....	980
Places for stated preaching.....	1,126
Average congregations.....	61,188
Adherents.....	100,914
Ordained missionaries (11 being physicians).....	167
Physicians not ordained.....	14
Other male assistants.....	11
Women.....	283
Whole number of laborers sent from this country.....	473
Native pastors.....	166
Other native helpers.....	1,909
Whole number of laborers.....	2,607
Pages printed.....	18,650,000
Churches.....	386
Church-members.....	30,546
Added during the year.....	4,388
Whole number from the first, as nearly as can be learned.....	105,477
Theological seminaries and station-classes.....	17
Pupils.....	251
Colleges and high-schools.....	50
Boarding-schools for girls.....	50
Common schools.....	892
Whole number under instruction.....	42,738
Native contributions.....	\$124,274

Among the incidents showing advance in the various mission fields were the gradual elevation of the standards in the theological seminaries at Marsovan, Harpoot, and Marash, Asiatic Turkey, for adaptation to the growing needs of the field and to the better class of candidates furnished by the colleges; the proclamations that had been issued in many provinces of China describing the missionaries as teachers of virtue, and their influence as helpful to the state, and enjoining upon the people to refrain from violence and live with them as hosts and guests; the restoration of the rights of the missionaries in Micronesia, which had been disturbed by the Spanish occupation—while the German occupation of the Marshall Islands had but slightly affected the condition of the work there; the dedication of a church at Sofia, Bulgaria; and the discussion of a proposition for a union of the Congregational and Presbyterian churches in Japan. The Home for missionary children at Auburndale, Mass., had a fund of \$18,500, and had accommodated several missionary families for longer or shorter periods, as well as missionary children not otherwise provided for.

A report from the committee on the codification of the rules and by-laws of the board, which had been appointed in the preceding year, was received and adopted. Included in it were various propositions of amendments, which were arranged in two classes: first, such as were necessary to make the by-laws conform to law and usage; and, second, such as experience had indicated for convenient working. Among those of the latter class

were one making the number of corporate members 250 instead of "200 active members," and striking out the word "active"; one making all nominations, except the appointment of the nominating committee, subject to the approval of the board; and others, fixing the number of members of the Prudential Committee at ten; designating three corresponding and recording, and assistant recording secretaries, instead of "secretaries" simply; providing for the appointment by the Prudential Committee of an editorial secretary; and changing the number of corporate members who may demand a special meeting from seven to twenty-five. A committee of fifteen was appointed.

To consider the relation of the board to the churches and individuals who make the board their missionary agent, and the expediency, in view of the facts which they may ascertain, of securing a closer union between them, and especially including the subject of the selection of corporate members, and that this committee be instructed to report such action, if any, as they may deem wise in this direction, at a subsequent annual meeting of the board.

Ordination of William H. Noyes, and the Doctrine of Future Probation.—The points of doctrine involved in what is called the "Andover Case" (see "Annual Cyclopædia" for 1886 and 1887, article "Congregationalists") was again made a subject of public attention in October by the action of a council held with the Berkeley Street Church, Boston, in ordaining the Rev. William H. Noyes to be a missionary. Mr. Noyes was one of the young men who had offered their services to the American Board in 1886, and had been rejected on account of his views respecting "future probation." Twenty-two churches were invited to participate in the council that was called to deliberate on the subject of the ordination, four of which failed to respond. The council met October 22, and was presided over by the Rev. Joseph T. Duryea, D. D. After the council had decided, in the face of adverse motions made by opponents of the contemplated measure, to proceed with the business for which it had been called, Mr. Noyes offered a statement of belief, in which he said respecting "future probation":

Regarding future things, I believe that the supreme fact revealed is the coming of our Lord Jesus Christ in glory to the judgment. Christ's judgment will not be arbitrary, but in righteousness, according to his Gospel. This judgment, I believe, is final. The wicked shall forever depart from God, but the righteous shall forever live with God. I believe that we shall all stand before the judgment-seat of God and each one of us shall give an account of himself to God, whose servant each one is, and before whom each standeth or falleth. Of the intermediate state I hold no positive doctrine. I do not know what effect physical death will have upon character. What I dread for my fellow-men is spiritual death. The spirit of God will not strive with men forever. Then woe is me if I preach not the Gospel at once! With the gospel message I believe there go decisive opportunity and obligation to repent. We simply should so present his message that men will be saved by it and not lost. Those who do not bear the message in this life, I trustfully leave with God. I do not claim to know God's method of dealing with them, but I do

not refuse to think of them. I entertain in their behalf what I conceive to be a reasonable hope that somehow, before their destinies are fixed, there shall be revealed to them the love of God in Christ Jesus. In this, as in other questions in which God has given no decisive answer, I merely claim the liberty of the Gospel.

In reply to the questioning by members of the council, he said that his faith was more vital to him now than when he offered himself to the board, but that he had not intentionally changed the form of his expression of belief regarding future probation. He had intended to convey the same impression to the board as now. He had found the doctrine neither taught nor forbidden in the Scriptures. The council expressed its satisfaction with the examination, and advised the Berkeley Street Church to endeavor to secure an arrangement by which he could work under the same direction as the other missionaries of the Congregational churches; and that, in case such an arrangement could not be made, the church itself assume the responsibility of his direction and support. Mr. Noyes was then ordained. Application was afterward made to the Prudential Committee of the American Board to accept the candidate as a missionary to Japan. This the committee declined to do in a letter in which its own action and the action of the American Board at the annual meetings in 1886 and 1887 approving its course were reviewed. Respecting the present situation of the case, the committee had hoped, when the new application was presented, that experience and further study had so far modified Mr. Noyes's previously expressed views, that he could withdraw his former statements, and so express himself that he could be approved without violation of the instructions of the board. But in this particular it had been disappointed. Had he been able to withdraw or modify his statements previously made, his case might possibly be considered simply on the basis of a new statement. But he had repeatedly assured the committee in conference that he had not consciously altered his opinions or his expression of them. All of his statements taken together made it plain that he was to be included among those candidates "who accept, under some form of statement, the hypothesis of a probation after death," and in relation to whom the board had given instructions adverse to their appointment. The committee had therefore voted:

That inasmuch as the Rev. William H. Noyes declines to withdraw the statements made by him to the committee at the time of his previous applications for appointment which favor the hypothesis of a probation after death—this hypothesis being, as he there states, "in harmony with Scripture," and one which "honors Christ in giving completeness to his work," and which is to him "a necessary corollary" to a belief in the universality of the atonement; and inasmuch as he has now emphatically stated to the committee that he knows of no change in his feelings or his expression of them, nor in his position, since he first presented them to the Prudential Committee in

1866, except that his faith has become "more vital"; therefore, in accordance with the instructions given to the committee by the board at its annual meeting in 1886, which were reaffirmed with emphasis in 1887, when this particular case was under review, the committee has no option but to decline to appoint the applicant so long as he holds these views.

Congregational Union of England and Wales.—The Congregational Union of England and Wales met in London, May 7. The Rev. Dr. Bruce presided, and the Rev. Griffith John was chosen president for the ensuing year. The financial statement showed that the income of the Union for the year had been £10,122, and the expenditure, £11,092. The secretary's report represented that the proposed conference between the Congregational and Baptist churches had been postponed, but not without hope that the aim of preventing denominational overlapping would presently be accomplished. The decision of the Tooting case in favor of the Congregationalists was mentioned, with an expression of regret that such a cause of contention with the Presbyterians should have existed. A plan had been prepared for the celebration of the bicentenary of the revolution of 1688, with addresses and lectures, and by making the subject a special feature of the autumnal meetings of the body. The proposed celebration was approved of by the Union. The formation of church-guilds had been encouraged. Measures had been taken for the Union becoming its own publisher of books, etc. The committee had supported the bill for legalization of marriage with a deceased wife's sister; had abstained from taking action in reference to the early closing bill; had arranged for presentation to the Union of a memorial of the Band of Hope Union, in reference to the use of non-alcoholic liquors at the sacrament; and had devised plans by which the time of the Union should not be so much encroached on as heretofore by deputations. They had not acceded to Rev. Foster Lepine's suggestion that arrangements should be made by which party politics would be avoided at the representative meetings of the Union. The Jubilee fund had been closed with total receipts recorded at £434,470, and total disbursements at £248,875. The Welsh churches had raised £100,000 for the extinction of debts, and £93,236 had been contributed toward metropolitan church extension. The working expenses of the scheme for seven years had amounted to £2,201, no part of which had come out of the contributions. A protest was adopted against the management of Holloway College, an institution, it was held, which, while the founder had intended it should be undenominational, appeared to have fallen too much under the influence of the established Church. A letter of commendation was ordered sent to the Australian and Canadian churches. A resolution was adopted protesting against fresh legislation which should provide for supporting denominational schools out of the rates.

The receipts of the Church Aid Society had been £38,712, and its expenditures about £30,000. It had aided during the year 1,101 congregations, under the care of 474 pastors and 109 missionaries.

The thirty-fourth annual meeting of the English Congregational Chapel Building Society was held in Bristol, April 10. The total resources for the year had been £7,258. The payments had been £4,241. The total receipts from the beginning of the society's operations had been £178,855, and the disbursements £165,811.

London Missionary Society.—The annual meeting of the London Missionary Society was held May 10. Lord Brassey presided. The income of the society had been £125,000, and its expenditures, £128,000. The 184 men and women missionaries were aided in their work by 1,500 native pastors and 5,000 native preachers. Progress was reported of the missions in China, India, Madagascar, where, notwithstanding a critical stage had been reached, there were signs of advance, and a concentration of missionaries near the capital was needed; South Africa, where the conditions were not encouraging; New Guinea, where advance was making; and Samoa, where the society had 27,000 adherents, who built their own churches, supported their own pastors, and contributed £1,000 a year to the parent society.

Autumnal Meeting of the Union.—The Congregational Union met in its autumnal session at Nottingham, October 9. The Rev. Dr. Robert Bruce presided, and spoke in his opening address in criticism of the proposals in the educational report of the Royal Commissioners. A resolution was adopted disapproving the policy embodied in the recommendations of the majority of the commission, as distinctly reactionary in character, and thereby confirming the forebodings which the Union had expressed at its meeting in May. Objection was made in particular to the proposed appropriation of local rates to schools under private management, and to the removal of restrictions on sectarian teaching; and the opinion expressed in former resolutions was reiterated, that no system of education will be satisfactory under which national funds are appropriated to schools or training-colleges which are under the control of denominational managers. Papers were read on "The Work of Congregational Churches in England—in Villages," by the Rev. A. D. Phillips; "in Urban Congregations," by the Rev. H. H. Huffodine; "Among the Working-Classes in Towns," Rev. F. W. Neuland; "Church Extension in Large and Growing Centers," Mr. W. H. Conyers; "Efforts among Special Classes, such as Canalmen and Navvies," Rev. T. Gascoigne; "The Need of a System of Christian Economics," Rev. F. W. Stead; "Pentateuchal Criticism," Prof. O. C. Whitehouse; and on other subjects of interest to the churches. A

public meeting was held in celebration of the revolution of 1688. The consideration of a resolution denouncing the coercive policy of the Government in Ireland was declined by the assembly as such; but opportunity was given at adjournment for holding a special meeting of ministers and delegates to entertain it. The resolution as adopted by this meeting placed its action on the ground that the question was one of national righteousness "far away from and above every question of party and politics." Seventy-five ministers and delegates protested against the suspension of the sessions for holding this meeting. It was shown at a meeting in behalf of the Irish Evangelical Society that there are 27 Congregational churches in Ireland, 9 of which are self-supporting, with 85 out-stations, 17 ministers, 24 lay preachers, one evangelist, 2,686 adherents, and more than a thousand pupils in Sunday-schools.

The Tooting Case.—The "Tooting case," the decision of which in favor of the Congregationalists is mentioned in the account of the proceedings of the Congregational Union, arose from a controversy with the Presbyterian Church respecting the title to the old meeting-house at Tooting-Graveney, which had been put in trust by Emma Mills in 1786, as a "place for Protestant Dissenters of the Presbyterian or Independent denomination." The place had been used under this trust till 1879 as an Independent chapel. In that year a resolution was passed by the congregation, at the request of the pastor, to apply for admission to the Presbyterian Church. The application was granted by the Presbyterian Synod, and a representative of the Presbyterian Church of England was delegated to preside over a meeting of the society. Suit was brought in behalf of the Congregationalists to test the title to the meeting-house. The decision of the court was given in March. It declared the action by which the transfer to the Presbyterian Church was made to be invalid—first, for want of unanimity in the application by the congregation, the presence of one dissensionist when the vote was taken showing that it was opposed; and, second, because the affiliation of the society with the English Presbyterian Church as now constituted must be regarded as in contravention of the original trust. Although "Presbyterians" are mentioned in the deed, the present rules of the Presbyterian Church as contained in the "Book of Order," are quite inconsistent with the Independency of 1786; for, the court declared, Independency consists in each particular church "standing alone" and being "self-governed"; while the "Book of Order" is directly contrary to that position. The decision was applied only to the external relations of the Church, and was not held to affect either the title of the pastor or the right of the existing congregation to regulate its own internal affairs in its own way.

CONGRESS OF THE UNITED STATES. The Fiftieth Congress assembled for its first session Dec. 5, 1887. It was composed as follows :

SENATE.

President, John J. Ingalls.
Secretary, Anson G. McCook.

<i>Alabama.</i>	<i>Mississippi.</i>
1889. John T. Morgan, D.	1889. E. C. Walthall, D.
1891. James L. Pugh, D.	1893. James Z. George, D.
<i>Arkansas.</i>	<i>Missouri.</i>
1889. James H. Berry, D.	1891. George G. Vest, D.
1891. James K. Jones, D.	1893. Francis M. Cockrell, D.
<i>California.</i>	<i>Nebraska.</i>
1891. Leland Stanford, R.	1889. C. F. Manderson, R.
1893. George Hearst, D.	1893. A. S. Paddock, R.
<i>Colorado.</i>	<i>Nevada.</i>
1889. Thomas M. Bowen, R.	1891. John P. Jones, R.
1891. Henry M. Teller, R.	1893. William M. Stewart, R.
<i>Connecticut.</i>	<i>New Hampshire.</i>
1891. Orville H. Platt, R.	1889. Wm. E. Chandler, R.
1893. Joseph R. Hawley, R.	1891. Henry W. Blair, R.
<i>Delaware.</i>	<i>New Jersey.</i>
1889. Eli Saulsbury, D.	1889. John B. McPherson, D.
1893. George Gray, D.	1893. Rufus Blodgett, D.
<i>Florida.</i>	<i>New York.</i>
1891. Wilkinson Call, D.	1891. William M. Everts, R.
1893. Samuel Pasco, D.	1893. Frank Hiscock, R.
<i>Georgia.</i>	<i>North Carolina.</i>
1889. Alfred H. Colquitt, D.	1889. Matt. W. Ransom, D.
1891. Joseph E. Brown, D.	1891. Zebulon B. Vance, D.
<i>Illinois.</i>	<i>Ohio.</i>
1889. Shelby M. Cullom, R.	1891. Henry B. Payne, D.
1891. Charles B. Farwell, R.	1893. John Sherman, R.
<i>Indiana.</i>	<i>Oregon.</i>
1891. Daniel W. Voorhees, D.	1889. Joseph N. Dolph, R.
1893. David Turpie, D.	1891. John H. Mitchell, R.
<i>Iowa.</i>	<i>Pennsylvania.</i>
1889. James F. Wilson, R.	1891. J. D. Cameron, R.
1891. William B. Allison, R.	1893. Matthew S. Quay, R.
<i>Kansas.</i>	<i>Rhode Island.</i>
1889. Preston B. Plumb, R.	1889. Jonathan Chace, R.
1891. John J. Ingalls, R.	1893. Nelson W. Aldrich, R.
<i>Kentucky.</i>	<i>South Carolina.</i>
1889. James B. Beck, D.	1889. Matthew C. Butler, D.
1891. J. C. S. Blackburn, D.	1891. Wade Hampton, D.
<i>Louisiana.</i>	<i>Tennessee.</i>
1889. Randall L. Gibson, D.	1889. Isham G. Harris, D.
1891. James B. Eastland, D.	1893. William B. Bate, D.
<i>Maine.</i>	<i>Texas.</i>
1889. William P. Frye, R.	1889. Richard Coke, D.
1893. Eugene Hale, R.	1893. John H. Reagan, D.
<i>Maryland.</i>	<i>Vermont.</i>
1891. Ephraim K. Wilson, D.	1891. Justin S. Morrill, R.
1893. Arthur P. Gorman, D.	1893. G. F. Edmunds, R.
<i>Massachusetts.</i>	<i>Virginia.</i>
1889. George F. Hoar, R.	1889. H. H. Riddleberger, R.
1893. Henry L. Dawes, R.	1893. John W. Daniel, D.
<i>Michigan.</i>	<i>West Virginia.</i>
1889. Thomas W. Palmer, R.	1889. John E. Kenna, D.
1893. F. B. Stockbridge, R.	1893. C. J. Faulkner, D.
<i>Minnesota.</i>	<i>Wisconsin.</i>
1889. Dwight M. Sabin, R.	1891. John O. Spooner, R.
1893. Cushman K. Davis, R.	1893. Philletus Sawyer, R.

Whole number of Senators, 76. Republicans, 39, and Democrats, 37.

: Seat contested by Daniel B. Lucas, Dem., who was appointed by the Governor of West Virginia.

HOUSE OF REPRESENTATIVES.

Washington—Charles S. Voorhees, D.

Wyoming—Joseph M. Carey, R.

John D. Ingalls, of Kansas, was President *pro tempore* of the Senate; Anson G. McCook, Secretary; William P. Canaday, Sergeant-at-arms; J. G. Butler, Chaplain; and James W. Allen, Postmaster.

The House organized by electing John G. Carlisle, of Kentucky, Speaker, by the following vote: John G. Carlisle, 163; Thomas B. Reed, of Maine, 147; C. N. Brumm, of Pennsylvania, 2.

¹ Seth C. Moffatt, of the 11th Michigan district, died Dec. 23, 1861, and Henry W. Seymour (R.), was elected to fill the vacancy.

In the course of his address, on taking the Speaker's chair, Mr. Carlisle said:

"Gentlemen, there has scarcely ever been a time in our history when the continued prosperity of the country depended so largely upon legislation in Congress as now, for the reason that the dangers which at this time threaten the commercial and industrial interests of the people are the direct results of laws which Congress alone can modify or repeal. Neither the Executive Department of the General Government nor the local authorities of the several States can deal effectively with the situation which now confronts us. Whatever is done must be done here; and if nothing is done the responsibility must rest here.

"It must be evident to every one who has taken even a partial view of public affairs that the time has now come when a revision of our revenue laws and a reduction of taxation are absolutely necessary in order to prevent a large and dangerous accumulation of money in the Treasury. Whether this ought or ought not to have been done heretofore is a question which it would be useless now to discuss. It is sufficient for us to know that the financial condition of the Government and the private business of the people alike demand the prompt consideration of these subjects and a speedy enactment of some substantial measure of relief.

"Unfortunately, gentlemen, we are menaced by dangers from opposite directions. While a policy of non-action must inevitably, sooner or later, result in serious injury to the country, we can not be unmindful of the fact that hasty and inconsiderate legislation upon subjects more or less affecting great financial and industrial interests might produce, temporarily at least, disturbances and embarrassments which a wise and prudent course would entirely avoid. Investments made and labor employed in the numerous and valuable industries which have grown up under our present system of taxation ought not to be rudely disturbed by sudden and radical changes in the policy to which they have adjusted themselves, but the just demands of an overtaxed people and the obvious requirements of the financial situation can not be entirely ignored without seriously imperiling much greater and more widely extended interests than any that could possibly be injuriously affected by a moderate and reasonable reduction of duties.

"No part of our people are more immediately and vitally interested in the continuance of financial prosperity than those who labor for wages: for upon them and their families must always fall the first and most disastrous consequences of a monetary crisis; and they, too, are always the last to realize the benefit resulting from a return to prosperous times. Their wages are the first to fall when a crisis comes, and the last to rise when it passes away. Our effort should be to afford the necessary relief to all without injury to the interests of any; and it seems to me that course of legisla-

tion should be pursued which will guarantee the laboring-people of the country against the paralyzing effects of a general and prolonged financial depression, and at the same time not interfere with their steady employment, or deprive them of any part of the just rewards of their toil. If this can be done—and I believe it can, if our deliberations are conducted with the wisdom and patriotism which the gravity of the situation demands—this Congress will have cause to congratulate itself upon an achievement which promises peace and prosperity to the country for many years to come."

The following officers of the House were chosen: Chaplain, Rev. W. H. Milburn; Chief Clerk, Thomas O. Towles; Sergeant-at-Arms, John P. Leedom; Postmaster, Lycurgus Dalton; Doorkeeper, A. B. Hurt.

The President's Message.—Dec. 6, 1887, the President's Message was sent in. It was as follows:

To the Congress of the United States:

You are confronted at the threshold of your legislative duties with a condition of the national finances which imperatively demands immediate and careful consideration. The amount of money annually exacted through the operation of present laws from the industries and necessities of the people largely exceeds the sum necessary to meet the expenses of the Government.

When we consider that the theory of our institutions guarantees to every citizen the full enjoyment of all the fruits of his industry and enterprise, with only such deduction as may be his share toward the careful and economical maintenance of the Government which protects him, it is plain that the exaction of more than this is indefensible extortion and a culpable betrayal of American fairness and justice. This wrong, inflicted upon those who bear the burden of national taxation, like other wrongs, multiplies a brood of evil consequences. The public Treasury, which should only exist as a conduit conveying the people's tribute to its legitimate objects of expenditure, becomes a hoarding place for money needlessly withdrawn from trade and the people's use, thus crippling our national energies, suspending our country's development, preventing investment in productive enterprise, threatening financial disturbance, and inviting schemes of public plunder.

This condition of our Treasury is not altogether new; and it has more than once of late been submitted to the people's representatives in the Congress, who alone can apply a remedy. And yet the situation still continues, with aggravated incidents, more than ever presaging financial convulsion and widespread disaster. It will not do to neglect this situation because its dangers are not now palpably imminent and apparent. They exist none the less certainly, and await the unforeseen and unexpected occasion when suddenly they will be precipitated upon us.

On the 30th day of June, 1885, the excess of revenues over public expenditures after complying with the annual requirement of the sinking-fund act was \$17,859,735.84. During the year ended June 30, 1886, such excess amounted to \$49,406,545.20, and during the year ended June 30, 1887, it reached the sum of \$55,567,849.54. The annual contributions to the sinking fund during the three years above specified, amounting in the aggregate to \$188,058,320.94 and deducted from the surplus as stated, were made by calling in for that purpose outstanding three-per-cent. bonds of the Government. During the six months prior to June 30, 1887, the surplus revenue had grown so large by repeated accumulation and it was feared the withdrawal of this great sum of money needed by

the people would so affect the business of the country, that the sum of \$79,864,100 of such surplus was applied to the payment of the principal and interest of the three-per-cent. bonds still outstanding, and which were then payable at the option of the Government.

The precarious condition of financial affairs among the people still needing relief, immediately after the 30th day of June, 1887, the remainder of the three-per-cent. bonds then outstanding, amounting with principal and interest to the sum of \$18,877,500, were called in and applied to the sinking-fund contribution for the current fiscal year. Notwithstanding these operations of the Treasury Department, representations of distress in business circles not only continued but increased, and absolute peril seemed at hand. In these circumstances the contribution to the sinking fund for the current fiscal year was at once completed by the expenditure of \$27,684,283.55 in the purchase of Government bonds not yet due, bearing four and four and one half per cent. interest, the premium paid thereon averaging about twenty-four per cent. for the former and eight per cent. for the latter.

In addition to this the interest accruing during the current year upon the outstanding bonded indebtedness of the Government was to some extent anticipated, and banks selected as depositories of public money were permitted to somewhat increase their deposits.

While the expedients thus employed, to release to the people the money lying idle in the Treasury, served to avert immediate danger, our surplus revenues have continued to accumulate, the excess for the present year amounting on the 1st day of December to \$55,258,701.19, and estimated to reach the sum of \$118,000,000 on the 30th of June next, at which date it is expected that this sum, added to prior accumulations, will swell the surplus in the Treasury to \$140,000,000.

There seems to be no assurance that, with such a withdrawal from use of the people's circulating medium, our business community may not in the near future be subjected to the same distress which was quite lately produced from the same cause. And while the functions of our national Treasury should be few and simple, and while its best condition would be reached, I believe, by its entire disconnection with private business interests, yet when, by a perversion of its purposes, it idly holds money uselessly subtracted from the channels of trade, there seems to be reason for the claim that some legitimate means should be devised by the Government to restore in an emergency, without waste or extravagance, such money to its place among the people.

If such an emergency arises there now exists no clear and undoubted Executive power of relief. Heretofore the redemption of three-per-cent. bonds, which were payable at the option of the Government, has afforded a means for the disbursement of the excess of our revenues; but these bonds have all been retired, and there are no bonds outstanding the payment of which we have the right to insist upon. The contribution to the sinking fund which furnishes the occasion for expenditure in the purchase of bonds has been already made for the current year, so that there is no outlet in that direction.

In the present state of legislation the only pretense of any existing Executive power to restore, at this time, any part of our surplus revenues to the people by its expenditure, consists in the supposition that the Secretary of the Treasury may enter the market and purchase the bonds of the Government not yet due, at a rate of premium to be agreed upon. The only provision of law from which such a power could be derived is found in an appropriation bill passed a number of years ago; and it is subject to the suspicion that it was intended as temporary and limited in its application, instead of conferring a continuing discretion and authority. No condition ought to exist which would justify the grant of power to a single official, upon his judgment of its necessity, to with-

hold from or release to the business of the people, in an unusual manner, money held in the Treasury, and thus affect, at his will, the financial situation of the country; and if it is deemed wise to lodge in the Secretary of the Treasury the authority in the present juncture to purchase bonds, it should be plainly vested, and provided as far as possible, with such checks and limitations as will define this official's right and discretion, and at the same time relieve him from undue responsibility.

In considering the question of purchasing bonds as a means of restoring to circulation the surplus money accumulating in the Treasury, it should be borne in mind that premiums must, of course, be paid upon such purchase, that there may be a large part of these bonds held as investments which can not be purchased at any price, and that combinations among holders, who are willing to sell, may unreasonably enhance the cost of such bonds to the Government.

It has been suggested that the present bonded debt might be refunded at a less rate of interest, and the difference between the old and new security paid in cash, thus finding use for the surplus in the Treasury. The success of this plan, it is apparent, must depend upon the volition of the holders of the present bonds; and it is not entirely certain that the inducement which must be offered them would result in more financial benefit to the Government than the purchase of bonds, while the latter proposition would reduce the principal of the debt by actual payment, instead of extending it.

The proposition to deposit the money held by the Government in banks throughout the country, for use by the people, is, it seems to me, exceedingly objectionable in principle, as establishing too close a relationship between the operations of the Government Treasury and the business of the country, and too extensive a commingling of their money, thus fostering an unnatural reliance in private business upon public funds. If this scheme should be adopted it should only be done as a temporary expedient to meet an urgent necessity. Legislative and Executive effort should generally be in the opposite direction, and should have a tendency to divorce, as much and as fast as can safely be done, the Treasury Department from private enterprise.

Of course it is not expected that unnecessary and extravagant appropriations will be made for the purpose of avoiding the accumulation of an excess of revenue. Such expenditure, besides the demoralization of all just conceptions of public duty which it entails, stimulates a habit of reckless improvidence not in the least consistent with the mission of our people or the high and beneficent purposes of our Government.

I have deemed it my duty to thus bring to the knowledge of my countrymen, as well as to the attention of their representatives charged with the responsibility of legislative relief, the gravity of our financial situation. The failure of the Congress heretofore to provide against the dangers which it was quite evident the very nature of the difficulty must necessarily produce, caused a condition of financial distress and apprehension since your last adjournment, which taxed to the utmost all the authority and expedients within Executive control; and these appear now to be exhausted. If disaster results from the continued inaction of Congress, the responsibility must rest where it belongs.

Though the situation thus far considered is fraught with danger which should be fully realized, and though it presents features of wrong to the people as well as peril to the country, it is but a result growing out of a perfectly palpable and apparent cause, constantly reproducing the same alarming circumstances—a congested national Treasury and a depleted monetary condition in the business of the country. It need hardly be stated that while the present situation demands a remedy, we can only be saved from a like predicament in the future by the removal of its cause.

Our scheme of taxation, by means of which this needless surplus is taken from the people and put into the public Treasury, consists of a tariff or duty levied upon importations from abroad, and internal revenue taxes levied upon the consumption of tobacco and spirituous and malt liquors. It must be conceded that none of the things subjected to internal revenue taxation are, strictly speaking, necessities; there appears to be no just complaint of this taxation by the consumers of these articles, and there seems to be nothing so well able to bear the burden without hardship to any portion of the people.

But our present tariff laws, the vicious, inequitable, and illogical source of unnecessary taxation, ought to be at once revised and amended. These laws, as their primary and plain effect, raise the price to consumers of all articles imported and subject to duty, by precisely the sum paid for such duties. Thus the amount of the duty measures the tax paid by those who purchase for use these imported articles. Many of these things, however, are raised or manufactured in our own country, and the duties now levied upon foreign goods and products are called protection to these home manufactures, because they render it possible for those of our people who are manufacturers to make these taxed articles and sell them for a price equal to that demanded for the imported goods that have paid customs duty. So it happens that while comparatively a few use the imported articles, millions of our people, who never used and never saw any of the foreign products, purchase and use things of the same kind made in this country, and pay therefor nearly or quite the same enhanced price which the duty adds to the imported articles. Those who buy imports pay the duty charged thereon into the public Treasury, but the great majority of our citizens, who buy domestic articles of the same class, pay a sum at least approximately equal to this duty to the home manufacturer. This reference to the operation of our tariff laws is not made by way of instruction, but in order that we may be constantly reminded of the manner in which they impose a burden upon those who consume domestic products as well as those who consume imported articles, and thus create a tax upon all our people.

It is not proposed to entirely relieve the country of this taxation. It must be extensively continued as the source of the Government's income; and in a readjustment of our tariff the interests of American labor engaged in manufacture should be carefully considered, as well as the preservation of our manufacturers. It may be called protection, or by any other name, but relief from the hardships and dangers of our present tariff laws, should be devised with especial precaution against imperiling the existence of our manufacturing interests. But this existence should not mean a condition which, without regard to the public welfare or a national exigency, must always insure the realization of immense profits instead of moderately profitable returns. As the volume and diversity of our national activities increase, new recruits are added to those who desire a continuation of the advantages which they conceive the present system of tariff taxation directly affords them. So stubbornly have all efforts to reform the present condition been resisted by those of our fellow-citizens thus engaged, that they can hardly complain of the suspicion, entertained to a certain extent, that there exists an organized combination all along the line to maintain their advantage.

We are in the midst of centennial celebrations, and with becoming pride we rejoice in American skill and ingenuity, in American energy and enterprise, and in the wonderful natural advantages and resources developed by a century's national growth. Yet when an attempt is made to justify a scheme which permits a tax to be laid upon every consumer in the land for the benefit of our manufacturers, quite beyond a reasonable demand for governmental regard, it suits the purposes of advocacy to call our manufactures infant

industries, still needing the highest and greatest degree of favor and fostering care that can be wrung from Federal legislation.

It is also said that the increase in the price of domestic manufactures resulting from the present tariff is necessary in order that higher wages may be paid to our workmen employed in manufactories, than are paid for what is called the pauper labor of Europe. All will acknowledge the force of an argument which involves the welfare and liberal compensation of our laboring-people. Our labor is honorable in the eyes of every American citizen; and as it lies at the foundation of our development and progress, it is entitled, without affectation or hypocrisy, to the utmost regard. The standard of our laborers' life should not be measured by that of any other country less favored, and they are entitled to their full share of all our advantages.

By the last census it is made to appear that of the 17,892,099 of our population engaged in all kinds of industries 7,670,493 are employed in agriculture, 4,074,288 in professional and personal service (2,984,876 of whom are domestic servants and laborers), while 1,810,256 are employed in trade and transportation, and 3,837,119 are classed as employed in manufacturing and mining.

For present purposes, however, the last number given should be considerably reduced. Without attempting to enumerate all, it will be conceded that there should be deducted from those which it includes 375,143 carpenters and joiners, 285,401 milliners, dressmakers, and seamstresses, 172,726 blacksmiths, 133,756 tailors and tailoresses, 103,473 masons, 76,241 butchers, 41,309 bakers, 22,063 plasterers, and 4,891 engaged in manufacturing agricultural implements, amounting in the aggregate to 1,214,023, leaving 2,623,089 persons employed in such manufacturing industries as are claimed to be benefited by a high tariff.

To these the appeal is made to save their employment and maintain their wages by resisting a change. There should be no disposition to answer such suggestions by the allegation that they are in a minority among those who labor, and therefore should forego an advantage, in the interest of low prices for the majority; their compensation, as it may be affected by the operation of tariff laws, should at all times be scrupulously kept in view; and yet with alight reflection they will not overlook the fact that they are consumers with the rest; that they, too, have their own wants and those of their families to supply from their earnings, and that the price of the necessities of life, as well as the amount of the wages, will regulate the measure of their welfare and comfort.

But the reduction of taxation demanded should be so measured as not to necessitate or justify either the loss of employment by the workingman nor the lessening of his wages; and the profits still remaining to the manufacturer, after a necessary readjustment, should furnish no excuse for the sacrifice of the interests of his employes either in their opportunity to work or in the diminution of their compensation. Nor can the worker in manufactures fail to understand that while a high tariff is claimed to be necessary to allow the payment of remunerative wages, it certainly results in a very large increase in the price of nearly all sorts of manufactures, which, in almost countless forms, he needs for the use of himself and his family. He receives at the desk of his employer his wages, and perhaps before he reaches his home is obliged, in a purchase for family use of an article which embraces his own labor, to return in the payment of the increase in price which the tariff permits, the hard-earned compensation of many days of toil.

The farmer and the agriculturist who manufacture nothing, but who pay the increased price which the tariff imposes, upon every agricultural implement, upon all he wears, and upon all he uses and owns, except the increase of his flocks and herds and such things as his husbandry produces from the soil, is

invited to aid in maintaining the present situation; and he is told that a high duty on imported wool is necessary for the benefit of those who have sheep to shear, in order that the price of their wool may be increased. They of course are not reminded that the farmer who has no sheep is by this scheme obliged, in his purchases of clothing and woolen goods, to pay a tribute to his fellow-farmer as well as to the manufacturer and merchant; nor is any mention made of the fact that the sheep-owners themselves and their households must wear clothing and use other articles manufactured from the wool they sell at tariff prices, and thus as consumers must return their share of this increased price to the tradesman.

I think it may be fairly assumed that a large proportion of the sheep owned by the farmers throughout the country are found in small flocks numbering from twenty-five to fifty. The duty on the grade of imported wool which these sheep yield, is ten cents each pound if of the value of thirty cents or less, and twelve cents if of the value of more than thirty cents. If the liberal estimate of six pounds be allowed for each fleece, the duty thereon would be sixty or seventy-two cents, and this may be taken as the utmost enhancement of its price to the farmer by reason of this duty. Eighteen dollars would thus represent the increased price of the wool from twenty-five sheep and thirty-six dollars that from the wool of fifty sheep; and at present values this addition would amount to about one third of its price. If upon its sale the farmer receives this or a less tariff profit, the wool leaves his hands charged with precisely that sum, which in all its changes will adhere to it, until it reaches the consumer. When manufactured into cloth and other goods and material for use, its cost is not only increased to the extent of the farmer's tariff profit, but a further sum has been added for the benefit of the manufacturer under the operation of other tariff laws. In the mean time the day arrives when the farmer finds it necessary to purchase woolen goods and material to clothe himself and family for the winter. When he faces the tradesman for that purpose he discovers that he is obliged not only to return in the way of increased prices, his tariff profit on the wool he sold, and which then perhaps lies before him in manufactured form, but that he must add a considerable sum thereto to meet a further increase in cost caused by a tariff duty on the manufacture. Thus in the end he is aroused to the fact that he has paid upon a moderate purchase, as a result of the tariff scheme, which, when he sold his wool seemed so profitable, an increase in price more than sufficient to sweep away all the tariff profit he received upon the wool he produced and sold.

When the number of farmers engaged in wool-raising is compared with all the farmers in the country, and the small proportion they bear to our population is considered; when it is made apparent that, in the case of a large part of those who own sheep, the benefit of the present tariff on wool is illusory; and, above all, when it must be conceded that the increase of the cost of living caused by such tariff, becomes a burden upon those with moderate means and the poor, the employed and unemployed, the sick and well, and the young and old, and that it constitutes a tax which, with relentless grasp, is fastened upon the clothing of every man, woman, and child in the land, reasons are suggested why the removal or reduction of this duty should be included in a revision of our tariff laws.

In speaking of the increased cost to the consumer of our home manufactures, resulting from a duty laid upon imported articles of the same description, the fact is not overlooked that competition among our domestic producers sometimes has the effect of keeping the price of their products below the highest limit allowed by such duty. But it is notorious that this competition is too often strangled by combinations quite prevalent at this time, and frequently called trusts, which have for their object the regulation of the supply and price of commodities made and sold

by members of the combination. The people can hardly hope for any consideration in the operation of these selfish schemes.

If, however, in the absence of such combination, a healthy and free competition reduces the price of any particular dutiable article of home production, below the limit which it might otherwise reach under our tariff laws, and if, with such reduced price, its manufacture continues to thrive, it is entirely evident that one thing has been discovered which should be carefully scrutinized in an effort to reduce taxation.

The necessity of combination to maintain the price of any commodity to the tariff point, furnishes proof that some one is willing to accept lower prices for such commodity, and that such prices are remunerative; and lower prices produced by competition prove the same thing. Thus where either of these conditions exists a case would seem to be presented for an easy reduction of taxation.

The considerations which have been presented touching our tariff laws are intended only to enforce an earnest recommendation that the surplus revenues of the Government be prevented by the reduction of our customs duties, and, at the same time, to emphasize a suggestion that in accomplishing this purpose, we may discharge a double duty to our people by granting to them a measure of relief from tariff taxation in quarters where it is most needed and from sources where it can be most fairly and justly accorded.

Nor can the presentation made of such considerations be, with any degree of fairness, regarded as evidence of unfriendliness toward our manufacturing interests, or of any lack of appreciation of their value and importance.

These interests constitute a leading and most substantial element of our national greatness and furnish the proud proof of our country's progress. But if in the emergency that presses upon us our manufacturers are asked to surrender something for the public good and to avert disaster, their patriotism, as well as a grateful recognition of advantages already afforded, should lead them to willing co-operation. No demand is made that they shall forego all the benefits of governmental regard; but they can not fail to be admonished of their duty, as well as their enlightened self-interest and safety, when they are reminded of the fact that financial panic and collapse, to which the present condition tends, afford no greater shelter or protection to our manufactures than to our other important enterprises. Opportunity for safe, careful, and deliberate reform is now offered; and none of us should be unmindful of a time when an abused and irritated people, heedless of those who have resisted timely and reasonable relief, may insist upon a radical and sweeping rectification of their wrongs.

The difficulty attending a wise and fair revision of our tariff laws is not underestimated. It will require on the part of the Congress great labor and care, and especially a broad and national contemplation of the subject, and a patriotic disregard of such local and selfish claims as are unreasonable and reckless of the welfare of the entire country.

Under our present laws more than four thousand articles are subject to duty. Many of these do not in any way compete with our own manufactures, and many are hardly worth attention as subjects of revenue. A considerable reduction can be made in the aggregate, by adding them to the free list. The taxation of luxuries presents no features of hardship; but the necessities of life used and consumed by all the people, the duty upon which adds to the cost of living in every home, should be greatly cheapened.

The radical reduction of the duties imposed on raw material used in manufactures, or its free importation, is of course an important factor in any effort to reduce the price of these necessities; it would not only relieve them from the increased cost caused by the tariff on such material, but the manufactured product being thus cheapened, that part of the tariff now laid

upon such product as a compensation to our manufacturers for the present price of raw material could be accordingly modified. Such reduction, or free importation, would serve, beside, to largely reduce the revenue. It is not apparent how such a change could have any injurious effect upon our manufacturers. On the contrary it would appear to give them a better chance in foreign markets with the manufacturers of other countries, who cheapen their wares by free material. Thus our people might have the opportunity of extending their sales beyond the limits of home consumption, saving them from the depression, interruption to business, and loss caused by a glutted domestic market and affording their employes more certain and steady labor with its resulting quiet and contentment.

The question thus imperatively presented for solution should be approached in a spirit higher than partisanship and considered in the light of that regard for patriotic duty which should characterize the action of those entrusted with the weal of a confiding people. But the obligation to declared party policy and principle is not wanting to urge prompt and effective action. Both great political parties now represented in the Government have by repeated and authoritative declarations condemned the condition of our laws which permits the collection from the people of unnecessary revenue, and have in the most solemn manner, promised its correction, and neither as citizens nor partisans are our countrymen in a mood to condone the deliberate violation of these pledges.

Our progress toward a wise conclusion will not be improved by dwelling upon the theories of protection and free trade. This savors too much of bandying epithets.

It is a condition which confronts us—not a theory. Relief from this condition may involve a slight reduction of the advantages which we award our home productions, but the entire withdrawal of such advantages should not be contemplated. The question of free trade is absolutely irrelevant; and the persistent claim, made in certain quarters, that all efforts to relieve the people from unjust and unnecessary taxation are schemes of so called "Free Traders" is mischievous and far removed from any consideration for the public good. The simple and plain duty which we owe the people is to reduce taxation to the necessary expenses of an economical operation of the Government, and to restore to the business of the country the money which we hold in the Treasury through the perversion of governmental powers. These things can and should be done with safety to all our industries, without danger to the opportunity for remunerative labor which our workmen have, and with benefit to them and all our people, by cheapening their means of subsistence and increasing the measure of their comforts.

The Constitution provides that the President "shall from time to time give to the Congress information of the state of the Union." It has been the custom of the Executive, in compliance with this provision, to annually exhibit to the Congress, at the opening of its session, the general condition of the country, and to detail with some particularity the operation of the different Executive Departments. It would be especially agreeable to follow this course at the present time and to call attention to the valuable accomplishments of these departments during the fiscal year. But I am so much impressed with the paramount importance of the subject to which this communication has thus far been devoted, that I shall forego the addition of any other topic, and only urge upon your immediate consideration the "state of the Union" as shown in the present condition of our Treasury and our general fiscal situation, upon which every element of our safety and prosperity depends.

The reports of the heads of departments, which will be submitted, contain full and explicit information touching the transaction of the business intrusted to them, and such recommendations relating to

legislation in the public interest as they deem advisable. I ask for these reports and recommendations the deliberate examination and action of the legislative branch of the Government. There are other subjects not embraced in the departmental reports demanding legislative consideration and which I should be glad to submit. Some of them, however, have been earnestly presented in previous messages, and as to them I beg leave to repeat prior recommendations.

As the law makes no provision for any report from the Department of State a brief history of the transactions of that important department together with other matters which it may hereafter be deemed essential to commend to the attention of Congress, may furnish the occasion for a future communication.

Washington, Dec. 6, 1887. GROVER CLEVELAND.

Revenue Reform.—The great question of the session was revenue reform, as the Democratic majority of the House of Representatives undertook to carry out the policy outlined in the President's message. For this purpose the Democratic members of the Ways and Means Committee set to work and drafted the Mills Bill, so called after the chairman of the committee, Roger Q. Mills, of Texas. April 2, 1888, that gentleman reported this measure as one "to reduce taxation, and simplify the laws in relation to the collection of revenue"; and it was referred to the committee of the whole, and ordered to be printed with the accompanying majority report and the minority report submitted by Mr. McKinley, of Ohio. The bill was taken up for discussion April 17, and the debate was opened by Mr. Mills in support of the measure and Mr. Kelley, of Pennsylvania, in opposition to it. On May 19 the general debate was closed with speeches by Speaker Carlisle and Mr. Reed, of Maine; on May 31 the debate under the five-minute rule was begun, and July 19 it closed. Mr. Springer, of Illinois, on that occasion said: "The debate on the pending bill began on the 17th day of April last; since that time the committee has been occupied in general debate twenty-three day and eight evening sessions. There were consumed in the general debate one hundred and eleven hours and fifty-four minutes—fifty-six hours and eighteen minutes by Democrats, and fifty-five hours and thirty-six minutes by Republicans or those opposed to the bill. In all, one hundred and fifty-one speeches were made during the general debate on this bill. The debate upon the bill by paragraphs began May 31, since which time there have been occupied twenty-eight days, or one hundred and twenty-eight hours and ten minutes, including the time that will be consumed to-day. The whole number of days devoted to the debate and consideration of the bill has been fifty-one, and the number of hours two hundred and forty. This debate will perhaps be known as the most remarkable that ever occurred in our parliamentary history. It has awakened an interest not only throughout the length and breadth of our own country, but throughout the civilized world; and henceforth, as long as our Government shall endure, it shall be known as 'The Great Tariff Debate of 1888.'"

In his opening speech, Mr. Mills urged a reduction of the revenue on the ground that it exceeds the needs of the Government, and is produced by a system of taxation adopted to meet the emergencies of the civil war: "Mr. Chairmap, during our late civil war the expenditures required by an enormous military establishment made it necessary that the burdens of taxation should be laid heavily in all directions authorized by the Constitution. The internal-revenue and direct taxes were called into requisition to supplement the revenues arising from customs, to aid the Treasury to respond to the heavy demands which were being daily made upon it. The duties on imports were raised from an average on dutiable goods of 18·84 per cent. in 1861 to an average of 40·29 per cent. on dutiable goods during the five years from 1863 to 1866, inclusive. This was recognized at the time as an exceptionally heavy burden. It was stated by the distinguished gentleman who then presented to the House the bill so largely increasing the duties, and which to-day bears his honored name, that it was demanded by the exigencies of war, and must cease on the return of peace. In his own words, he said: 'This is intended as a war measure, a temporary measure, and we must as such give it our support.' More than twenty years have elapsed since the war ended. A generation has passed away and a new generation has appeared on the stage since peace has returned to bless our common country; but these war taxes still remain; and they are heavier to-day than they were on an average during the five years of the existence of hostilities. The average rate of duty during the last five years, from 1863 to 1867, inclusive, on dutiable goods amounts to 44·51 per cent., and during the last year the average is 47·10 per cent. Instead of the rate of taxation being reduced to meet the wants of an efficient administration of government in time of peace, it continues to grow and fill the coffers of the Government with money not required for public purposes, and which rightfully should remain in the pockets of the people."

But, in the opinion of Mr. Mills, excessive taxation is not the greatest evil of the existing tariff: "The greatest evil that is inflicted by it is in the destruction of the values of our exports. Remember that the great body of our exports are agricultural products. It has been so through our whole history. From 75 to over 80 per cent. of the exports of this country year by year are agricultural products. Cotton is first, then bread-stuffs, pork, beef, butter, cheese, lard. These are the things that keep up our foreign trade, and when you put on or keep on such duties as we have now—war duties which were regarded as so enormous even in the very midst of hostilities that they were declared to be temporary—when you put on or retain those duties, they limit and prohibit importation and that limits or prohibits exportation. It takes two to make

a trade. All the commerce of all the countries of the world is carried on by an exchange of commodities — commodities going from the country where they are produced at the least cost to seek a market in those countries where they can either not be produced at all or where they can be produced only at the highest cost of production. We are the great agricultural country of the world, and we have been feeding the people of Europe, and the people of Europe have got to give us in exchange the products of their labor in their shops; and when we put on excessive duties for the purpose of prohibiting the importations of their goods, as a necessary result we put an excessive duty upon the exportation of our own agricultural products. And what does that do? It throws our surplus products upon our own markets at home, which become glutted and oversupplied, and prices go down. So it is with the people of Europe who are manufacturing and producing things that we can not produce, but which we want. Their products are thrown upon their home markets, which are glutted and oversupplied, and their prices likewise go down. And whenever, from any cause, prices start up in Europe, our tariff being levied mainly by specific duties upon quantity, not upon value, the tariff goes down, and then we see large importation and, as a result, large exportation. Then we see a rise in agricultural products; then we see the circulation of money all through the whole of our industrial system; we see our people going to work, our manufactories starting up, and prosperity in every part of the land."

Mr. Mills also argued that the protective system, while of advantage to particular manufacturers, tends to cripple our production: "We are the greatest agricultural people in the world. We exceed all others in the products of manufacture, but we export next to nothing of our product. Why should we not export the three hundred and seventy-five millions of cotton goods which England is now exporting? She buys her cotton from us, pays the cost of transportation to her factories, makes the goods, and sends them all over the world. That trade, at least the most of it, is ours whenever we get ready to take it. Why should we not make and send out the hundred millions of woolen goods which she is annually exporting? We have the advantage of her in almost everything except cost of materials. Why should we not make and export the hundred millions of iron and steel which she is making and sending away annually? There is no reason except that high tariffs and trusts and combinations are in our way, and they muster all their forces to prevent us from taking the place which our advantages entitle us to take. We are the greatest people in the world. We have the highest standard of civilization; we have the highest and best diffusion of knowledge among our people. We utilize the power of machinery more than any

people in the world. We produce by our labor more than any people in the world. We have everything to command success in any contest over any rival. We are the first cotton-producing country. We have wool, flax, hemp; our country is full of coal and ores and lumber, and yet with all these advantages over all others we have pursued a suicidal policy of protection, which has closed the markets of the world against us; and not content to stop here, we have plundered the great body of our agricultural people out of a large part of their wealth. We must make a departure. Instead of laying the burdens of taxation upon the necessities of life, instead of destroying our foreign commerce, we should encourage it as we would encourage our home commerce. We should remove every unnecessary burden. We should lay taxes to obtain revenue, but not restrict importation. We should place every material of manufacture on the free list, start up our fires, put our wheels in motion, and put all our people to work at good wages."

After arguing that it is increased production that makes cheap goods and high wages, Mr. Mills said, in regard to the effect of the existing tariff on labor: "I have taken from the first annual report of the Commissioner of Labor and the report of the census on wages some figures given by manufacturers themselves of the total cost of the product and the labor cost of the articles they are making. I have put the tariff duty by the side of them to show whether in the little reductions we are asking in this bill we have gone beyond that pledge we as a party have made that we would not reduce taxation so low as to injure our laborers, or as not to cover the difference in cost of labor between American and foreign products. This will show, and I ask your attention to it, that the tariff is not intended to and does not benefit labor. It will show that the benefit of the tariff never passes beyond the pocket of the manufacturer, and to the pockets of his workmen.

"I find in this report one pair of five-pound blankets. The whole cost, as stated by the manufacturer, is \$2.51. The labor cost he paid for making them is 35 cents. The present tariff is \$1.90. Now, here is \$1.55 in this tariff over and above the entire labor cost of these blankets. Why did not that manufacturer go and give that money to the laborer? He is able to do it. Here is a tariff that gives him \$1.90 on that pair of blankets for the benefit of his laborer, but notwithstanding that the tariff was imposed for the benefit of American labor and to preserve high wages, every dollar of that tariff went into the manufacturer's pocket. The poor fellow who made the blankets got 35 cents and the manufacturer kept the \$1.90.

"Here is one yard of flannel, weighing four ounces; it cost 18 cents, of which the laborer got 3 cents; the tariff on it is 8 cents. How is it that the whole 8 cents did not get into the

pockets of the laborer? Is it not strange that those who made the tariff and fastened upon the people these war rates in a time of profound peace, and who are now constantly assailing the Democratic party because it is untrue to the workingman, did not make some provision by which the generous bounty they gave should reach the pocket of him for whom they said it was intended? They charge that we are trying to strike down the labor of the country. Why do they not see that the money they are taking out of the hard earnings of the people is delivered in good faith to the workman? One yard of cassimere, weighing 16 ounces, cost \$1.88; the labor cost is 29 cents; the tariff duty is 80 cents. One pound of sewing-silk costs \$5.66; the cost for labor is 85 cents; the tariff is \$1.69. One gallon of linseed-oil costs 46 cents; the labor cost is 2 cents; the tariff cost is 25 cents. One ton of bar-iron costs \$81; the labor cost is \$10; the tariff fixes several rates for bar-iron. I give the lowest rate, \$17.92. One ton of foundry pig-iron costs \$11; the labor costs \$1.64; the tariff is \$6.72."

After continuing the discussion of this point in detail, Mr. Mills said: "Now, Mr. Chairman, I have gone through with a number of articles taken from these official reports made by the manufacturers themselves, and I have shown that the tariff was not framed for the benefit of the laborer, or that if it was so intended by those who framed it, the benefit never reaches the laborer, not a dollar of it. The working-people are hired in the market at the lowest rates at which their services can be had, and all the 'boodle' that has been granted by these tariff bills goes into the pockets of the manufacturers. It builds up palaces; it concentrates wealth; it makes great and powerful magnates; but it distributes none of its beneficence in the homes of our laboring poor."

As to the spirit of the protective system which is sometimes called the American policy, Mr. Mills said: "I repel it, sir; it is not American. It is the reverse of American. That policy is American which clings most closely to the fundamental idea that underlies our institutions and upon which the whole superstructure of our Government is erected, and that idea is freedom—freedom secured by the guarantees of government; freedom to think, to speak, to write; freedom to go where we please, select our own occupations; freedom to labor when we please and where we please; freedom to receive and enjoy all the results of our labor; freedom to sell our products, and freedom to buy the products of others, and freedom to markets for the products of our labor, without which the freedom of labor is restricted and denied; freedom from restraints in working and marketing the products of our toil, except such as may be necessary in the interest of the Government; freedom from all unnecessary bur-

dens; freedom from all exactions upon the citizen except such as may be necessary to support an honest, efficient, and economical administration of the Government that guarantees him protection to 'life, liberty, and the pursuit of happiness'; freedom from all taxation except that which is levied for the support of the Government; freedom from taxation levied for the purpose of enriching favored classes by the spoliation and plunder of the people; freedom from all systems of taxation that do not fall with 'equal and exact justice upon all'—that do not raise the revenues of government in the way that is least burdensome to the people and with the least possible disturbance to their business. That, sir, is the American policy."

Mr. McKinley, of Ohio, who spoke May 18, conceded the necessity of reducing the revenue of the Government, but denied that the reduction should be made, as proposed in the Mills Bill. He said: "It will be freely confessed by our political opponents that this bill is but the beginning of a tariff policy marked out by the President, and is a partial response only to his message, to be followed up with additional legislation until our system of taxation shall be brought back to the ancient landmarks of the Democratic party, to a purely revenue basis; that is, that the tariff or duty put upon foreign importations shall hereafter look to revenue and revenue only, and discard all other considerations."

"This brings us face to face, therefore, with the two opposing systems, that of a revenue as distinguished from a protective tariff, and upon their respective merits they must stand or fall. Now, what are they? First, what is a revenue tariff? Upon what principle does it rest? It is a tariff or tax placed upon such articles of foreign production imported here as will produce the largest revenue with the smallest tax."

"To secure larger revenue from lower duties necessitates largely increased importations, and if these compete with domestic products the latter must be diminished or find other and distant and I may say impossible markets or get out of the way altogether. A genuine revenue tariff imposes no tax upon foreign importations the like of which are produced at home, or, if produced at home, in quantities not capable of supplying the home consumption, in which case it may be truthfully said the tax is added to the foreign cost and is paid by the consumer."

"A revenue tariff seeks out those articles which domestic production can not supply, or only inadequately supply, and which the wants of our people demand, and imposes the duty upon them, and permits as far as possible the competing foreign product to be imported free of duty. This principle is made conspicuous in the bill under consideration; for example, wool, a competing foreign product, which our own flock-masters can fully supply for domes-

tic wants, is put upon the free list, while sugar, with a home product of only one eleventh of the home consumption, is left dutiable."

"What is a protective tariff? It is a tariff upon foreign imports so adjusted as to secure the necessary revenue, and judiciously imposed upon those foreign products the like of which are produced at home or the like of which we are capable of producing at home. It imposes the duty upon the competing foreign product; it makes it bear the burden or duty, and, as far as possible, luxuries only excepted, permits the non-competing foreign product to come in free of duty. Articles of common use, comfort, and necessity which we can not produce here it sends to the people untaxed and free from custom-house exactions. Tea, coffee, spices, and drugs are such articles, and under our system are upon the free list. It says to our foreign competitor, if you want to bring your merchandise here, your farm products here, your coal and iron ore, your wool, your salt, your pottery, your glass, your cottons and woollens, and sell alongside of our producers in our markets, we will make your product bear a duty; in effect, pay for the privilege of doing it. Our kind of a tariff makes the competing foreign article carry the burden, draw the load, supply the revenue; and in performing this essential office it encourages at the same time our own industries and protects our own people in their chosen employments. That is the mission and purpose of a protective tariff. That is what we mean to maintain, and any measure which will destroy it we shall firmly resist, and if beaten on this floor we will appeal from your decision to the people, before whom parties and policies must at last be tried. We have free trade among ourselves throughout thirty-eight States and the Territories and among sixty millions of people. Absolute freedom of exchange within our own borders and among our own citizens is the law of the republic. Reasonable taxation and restraint upon those without is the dictate of enlightened patriotism and the doctrine of the Republican party. Free trade in the United States is founded upon a community of equalities and reciprocities. It is like the unrestrained freedom and reciprocal relations and obligations of a family. Here we are one country, one language, one allegiance, one standard of citizenship, one flag, one Constitution, one nation, one destiny. It is otherwise with foreign nations, each a separate organism, a distinct and independent political society organized for its own, to protect its own, and work out its own destiny. We deny to those foreign nations free trade with us upon equal terms with our own producers. The foreign producer has no right or claim to equality with our own. He is not amenable to our laws. There are resting upon him none of the obligations of citizenship. He pays no taxes. He performs no civil duties; is subject to no demands for military service. He is exempt

from State, county, and municipal obligations. He contributes nothing to the support, the progress, and glory of the nation. Why should he enjoy unrestrained equal privileges and profits in our markets with our producers, our labor, and our tax-payers? Let the gentleman who follows me answer. We put a burden upon his productions, we discriminate against his merchandise, because he is alien to us and our interests, and we do it to protect our own, defend our own, preserve our own, who are always with us in adversity and prosperity, in sympathy and purpose, and, if necessary, in sacrifice. That is the principle which governs us. I submit it is a patriotic and righteous one. In our own country, each citizen competing with the other in free and unresentful rivalry, while with the rest of the world all are united and together in resisting outside competition as we would foreign interference."

Mr. McKinley denied that the Mills Bill, though it professed to aim at a reduction of the revenue, would have that result so far as its tariff changes were concerned: "Take from this bill its internal-revenue features, its reduction of twenty-four and a half million dollars from tobacco and from special licenses to dealers in spirits and tobacco, eliminate these from the bill, and you will not secure a dollar of reduction to the Treasury under its operation. Your \$27,000,000 of proposed reduction by the free list will be more than offset by the increased revenues which shall come from your lower duties; and I venture the prediction here to-day that if this bill should become a law, at the end of the fiscal year 1889 the dutiable list under it will carry more money into the Treasury than is carried into the Treasury under the present law, because with every reduction of duties upon foreign imports you stimulate and increase foreign importations; and to the extent that you increase foreign importations, to that extent you increase the revenue."

Mr. McKinley criticised certain inconsistencies in the details of the bill, and then denounced one of the main features of it: "Now, there is one leading feature of this bill, which is not by any means the most objectionable feature, but which, if it stood alone, ought to defeat this entire measure; and that is the introduction of the ad-valorem system of assessment to take the place of the specific system now generally in force. You all know the difference between the ad-valorem system and the specific mode of levying duties. One is based upon value, the other upon quantity. One is based upon the foreign value, difficult of ascertainment, resting on the judgment of experts, all the time offering a bribe to undervaluation; the other rests upon quantity, fixed and well known the world over, always determinable and always uniform. The one is assessed by the yard-stick, the ton, and the pound-weight of commerce, and the other is assessed by the foreign value, fixed by the for-

ign importer or his agent in New York or elsewhere; fixed by the producer, fixed by anybody at any price to escape the payment of full duties."

Of the value of a home market and the diffusion of profits under a protective system, Mr. McKinley said: "Why, the establishment of a furnace or factory or mill in any neighborhood has the effect at once to enhance the value of all property and all values for miles surrounding it. They produce increased activity. The farmer has a better and a nearer market for his products. The merchant, the butcher, the grocer, have an increased trade. The carpenter is in greater demand; he is called upon to build more houses. Every branch of trade, every avenue of labor, will feel almost immediately the energizing influence of a new industry. The truck-farm is in demand; the perishable products, the fruits, the vegetables, which in many cases will not bear exportation, and for which a foreign market is too distant to be available, find a constant and ready demand at good paying prices. What the agriculturist of this country wants more than anything else, after he has gathered his crop, are consumers—consumers at home, men who do not produce what they eat, who must purchase all they consume; men who are engaged in manufacturing, in mining, in cotton-spinning, in the potteries, and in the thousands of productive industries which command all their time and energy, and whose employments do not admit of their producing their own food. The agriculturist further wants these consumers near and convenient to his field of supply."

After arguing that a protective system maintains high wages for the laborer, Mr. McKinley asserted that it also tends to reduce prices of commodities, and he illustrated his position as follows: "Blankets are numbered according to grade and according to weight. There are several grades of five-pound blankets numbered 1, 2, 3, 4, and 5. A No. 1 five-pound blanket made in the city of Philadelphia sells for \$1.72. The labor represented in the blanket is 87½ cents; the duty is \$1.02. Of a scarlet blanket, five pounds, the price is \$2.27; the labor is 87½ cents; the duty is \$3.17. Of the white all-wool Falls of Schuylkill blanket, the price is \$3.62; the labor, \$1.05; the duty, \$2.60. Of the Gold-Medal blanket the price is \$4.53; the labor, \$1.05; the duty, \$3.50.

"Now, Mr. Chairman, if the duty was added to the cost, what would the American manufacturers get for these blankets? They should get for the first blanket \$2.74. How much do they get? They get only \$1.72. They should get for the second blanket, duty added, \$3.77. How much do they get? They get \$2.27. They should get for the third \$5.12. How much do they get? They get \$3.17. They should get, duty added, for the fourth class \$6.22. How much do they get? They get \$4.35. They should get, duty added, for the highest grade \$8.03. How much do they get? They get \$4.05.

"Now, Mr. Chairman, what did these same blankets cost in 1860 under a revenue tariff, under the free-trade domination of this country by the Democratic party? What did we pay for the same blankets that year, as contrasted with what we pay now? The blanket that sells to-day for \$1.02 sold in 1860 for \$2. The blanket that sells now for \$1.45 sold in 1860 for \$2.50. The blanket that sells now for \$1.81 sold in 1860 for \$2.25. The blanket that sells now for \$1.90 sold in 1860 for \$3.50. The blanket that sells now for \$2.58 sold for \$3.75 in 1860. The blanket that sells now for \$4.35 sold for \$7.50 in 1860. The blanket that sells for \$5.85 now sold for \$10 in 1860. The blanket that sells now for \$6.80 sold for \$18 in 1860."

After appealing to the experience of the country in support of a protective system, and citing its prosperity as a result of such a system, Mr. McKinley said: "Who is objecting to our protective system? From what quarter does the complaint come? Not from the enterprising American citizen; not from the manufacturer; not from the laborer, whose wages it improves; not from the consumer, for he is fully satisfied, because under it he buys a cheaper and a better product than he did under the other system; not from the farmer, for he finds among the employes of the protected industries his best and most reliable customers; not from the merchant or the tradesman, for every hive of industry increases the number of his customers and enlarges the volume of his trade. Few, indeed, have been the petitions presented to this House asking for any reduction of duties upon imports. None, that I have seen or heard of, and I have watched with the deepest interest the number and character of these petitions that I might gather from them the drift of public sentiment—I say I have seen none asking for the passage of this bill, or for any such departure from the fiscal policy of the Government so long recognized and followed, while against this legislation there has been no limit to petitions, memorials, prayers, and protests, from producer and consumer alike."

"This measure is not called for by the people; it is not an American measure; it is inspired by importers and foreign producers, most of them aliens, who want to diminish our trade and increase their own; who want to decrease our prosperity and augment theirs, and who have no interest in this country except what they can make out of it. To this is added the influence of the professors in some of our institutions of learning, who teach the science contained in books and not that of practical business. I would rather have my political economy founded upon the every-day experience of the puddler or the potter than the learning of the professor, the farmer and factory hand than the college faculty. Then there is another class who want protective tariffs overthrown. They are the men of independent

wealth, with settled and steady incomes, who want everything cheap but currency; the value of everything clipped but coin—cheap labor but dear money. These are the elements which are arrayed against us."

Mr. Randall, in a speech delivered May 18, advocated reducing the revenue by a repeal of the internal-revenue taxes: "These taxes have always been the last to be levied and the first to be repealed when no longer needed. It was the boast of Jefferson that he had given the death-blow to the excise tax, 'that most vexatious of all taxes,' at the commencement of his administration; and among other things for which he received the thanks of the Legislature of his native State on his retirement from office was for 'internal taxes abolished.'"

"The first tax also to be repealed after the war of 1812 was the excise tax, which was recommended by Madison, and was the first law enacted under the administration of Monroe."

"The Democratic Convention of 1864 declared that 'the system of direct taxation known as the internal revenue is a 'war tax,' and this declaration, taken in connection with other declarations in the platform which I will quote further on, clearly establishes the fact that the opinion of the convention was that the internal-revenue 'war' taxes should first go, and should all go whenever a sufficient sum was realized from custom-house taxes to meet the expenses of the Government, economically administered. We are practically in such condition now, and a true response to these instructions warrants the repeal of the internal laws to the extent the bill proposes."

"I favor now, as I have always done, a total repeal of the internal-revenue taxation. In the bill which I introduced I proposed to sweep all these taxes off the statute-book except fifty cents on whisky, and I would transfer the collection of that tax to the customs officials, if, upon examination and reflection, it was found to be practicable."

Mr. Randall argued that the amount of protective duty is not added to the price paid by a consumer for an article except in cases where home production can not supply the market and so let competition fix prices; he held, too, that a tariff tax is not a bounty paid by one class to another, as there is an equalization of profits among all who partake of the benefits of an industrial system; and he argued against the notion that farmers could sell their products in dear markets and buy commodities in cheap ones under a free-trade system: "If the farmer ceases to buy the products of the manufacturers, he will certainly cease to sell to them, and must sell his products in the market where he buys what he consumes himself. Suppose last year we had manufactured a thousand millions' worth less than we did and had gone abroad for these products, expecting to pay for them with agricultural products; could a thousand millions more of agricultural products have been sold abroad at the price such

products brought here? We sold all the wheat and corn and meat products that Europe would take at the prices that prevailed. Who can tell at what prices Europe would have taken even five hundred millions or one hundred millions more of our agricultural products than she did take? The mere statement of the proposition is enough to disclose the error on which it is founded, and shows the importance of uniting manufactures with agriculture, or, as Jefferson states it, putting the manufacturer by the side of the farmer. In fact, both must, in our country, depend almost exclusively on our home market. It is folly, if not a crime, to attempt a change in these respects. It would bring ruin and bankruptcy without the possibility of having such a result accomplished. The greater the diversity of industries in any country, the greater the wealth-producing power of the people, and the more there is for labor and capital to divide, and the more independent that country becomes."

Mr. Randall criticised the Mills Bill severely in detail. He said: "Notwithstanding these facts, we have before us the bill of the committee, which is not in any proper sense a revision of the tariff, but consists of amendments constituting, I might say, a patchwork upon the existing law, perpetuating and multiplying its numerous infirmities of phraseology; its ambiguities and inequalities, which have perplexed and vexed the executive officers in its administration, have been the subject of volumes of Treasury decisions year by year, and have embroiled the Government and merchants in untold litigation, making it necessary to create new courts for the special trial of customs cases, which are increasing in number month by month, and involve unknown millions of demands upon the Government—a constant menace to the Treasury. Not only have the committee ignored the recommendations of Secretaries Manning and Fairchild and of the customs officers at the various ports for the adoption of specific duties, but have actually, in a large number of cases, substituted ad-valorem rates for existing specific duties, thus showing preference for a system which has been abandoned by all the civilized commercial nations on the globe, and which has been characterized as a system under 'which thieves prosper and honest traders are driven out of business.'

"A declared purpose of this bill is to secure 'free raw materials, to stimulate manufactures.' In execution of this idea the bill places on the free list a large number of articles which are really articles of manufacture, such as salt, sawed and dressed lumber, laths and shingles, hackled and dressed flax, burlaps, machinery, terne or galvanized plates, glue, glycerine, soap, certain proprietary articles, extracts of hemlock, oils of various kinds, including hemp-seed and rape-seed, olive and fish oils, refined sulphur, various coal-tar prep-

arations, earth-paints, distilled oils, alkalies, and various other chemical compounds; various manufactured mineral substances, prepared China clay, quicksilver, bricks of all kinds except fire-brick, prepared meats, lime, plaster of Paris, ground and calcined, various prepared drugs and chemicals, and many other articles of like character. These constitute the products of large and useful industries throughout the United States, in which many millions of capital are invested and employing many thousands of working people.

"At the same time the bill leaves or puts upon the dutiable lists such articles as lead ore, iron ore, zinc ores, nickel ore, and coal, which might be called raw materials, if that term can be properly applied to anything involving the expenditure of labor in its production. Further than this, the bill not only makes the so-called 'raw materials' free, such, for example, as flax, jute, hemp, hemp-seed and rape-seed, crude borax, opium, and hair of animals, but places on the free-list the manufactured products of these materials, namely, burlaps (for bagging, etc.), hemp-seed and rape-seed oil, boracic acid, codein and other salts and compounds of opium, and curled hair for mattresses, etc. Thus the manufacture of such articles is made impossible in this country, except by reducing American labor to a worse condition than that of labor in Europe. It goes even further, and places or leaves dutiable certain so-called raw materials, as, for example, iron ore, lead, coal, paper, paints, caustic soda and other alkalies, and sulphate of ammonia, while placing on the free list articles made from these materials, such as hoop-iron and cotton-ties, iron or steel sheets or plates or taggers iron coated with tin or lead, known as tin-plates, terne-plates, and taggers tin, sulphate of iron or copperas, machinery, books and pamphlets, paintings, soap, and alum. In other words, the bill leaves or makes dutiable the raw material and puts on the free list the article manufactured from it, thus not only placing an insurmountable barrier in the way of making such articles here, but actually protecting the foreign manufacturer and laborer against our own, and imposing for their benefit a burden upon the consumer in this country.

"Again, the bill places lower rates on some manufactured articles than on the materials used in making them, as, for instance, manufactures of paper, 15 per cent., and the paper to produce it at 25 per cent.

"It leaves an internal-revenue tax of more than 300 per cent. on alcohol used in the arts, amounting, according to a fair estimate, to as much as the entire amount of duty collected on raw wool, which alcohol enters as a material in a vast number of important and needful articles, which the committee have either made free or have so reduced the rates thereon that the duty would be less than the tax on the alcohol consumed in their manufacture.

"In some cases the difference between the

duty imposed by the bill on the so-called raw materials and the articles made from them is so small as to destroy these industries, except upon the condition of leveling the wages of home labor to that of Europe.

"In a large number of articles throughout the schedules not already named, the reductions proposed by the bill are so large that the effect must be to destroy or restrict home production and increase enormously foreign importations, thus largely increasing customs revenue instead of reducing it.

"It is claimed by the committee that the bill will reduce the customs revenue about \$54,000,000. On the contrary, I assert that it is fair to estimate that its effect would be to largely increase the revenue instead of reducing it; while the amount of material wealth it would destroy is incalculable.

"Those supporting the bill hold themselves out as the champions of the farmer while they take from him the protective duties on his wool, hemp, flaxseed, meats, milk, fruits, vegetables, and seeds. And what do they give him in return?

"They profess to give the manufacturer better rates than they now have. If this be so, how is the farmer to be benefited, or where does he get his compensation for the loss of his protective duties?

"Much has been said about removing taxes upon 'necessaries,' and imposing them upon 'luxuries.' What does this bill propose in that direction? It gives free olive-oil to the epicure, and taxes castor-oil 97 per cent.; it gives free tin-plate to the Standard Oil Company, and to the great meat-canning monopolies, and imposes a duty of 100 per cent. on rice; it gives the sugar trust free bone-black, and proposes prohibitory duties on grocery grades of sugar; it gives free license to the tobacco-manufacturer while retaining prohibitive duties on manufactured tobacco; it imposes a duty of 40 per cent. on the 'poor man's blanket' and only 30 per cent. on the Axminster carpet of the rich. It admits free of duty fine animals imported by the gentlemen of the turf, and makes free the paintings and the statuary of the railway millionaire and the coal baron."

Mr. Reed, of Maine, in closing the debate on the Republican side, May 19, said: "The revenue-reform argument is either a false pretense or covers the whole ground. Protection is either in its essence a benefit or a curse. You can not dilute a curse and make it a blessing. Ratsbane and water are no more food than ratsbane pure. Incidental protection is a sham. Tariff for revenue only goes down before the same arguments which are used against protection.

"If protection be a tax for manufacturers' benefit then it is the same tax if it be the result of even a revenue tariff. Incidental protection is of all the most inexcusable. It is an accident which ought to be avoided like a railway disaster. If when you take one dollar

from the citizen for the Treasury and four for the manufacturer, is it any the less robbery that you call it a revenue tariff?

"If you gentlemen on the other side believe what you say, you ought to be as furious against the rapine and plunder of the Mills Bill as you profess to be against those of the present law."

In answer to the argument that protection increases the price of articles consumed by the amount of duty, Mr. Reed said: "Why do men with such beliefs so plain, and so distinct, hesitate to do their duty? It is because every wind that blows, every sight that strikes their eyes, every sound that resounds in their ears, shows the folly of their theories, the absurdity of their logic. What use is it to tell the people of this empire that they have been robbed and plundered one thousand millions of dollars every year, during the very time when over 8,500 miles of distance cities have been springing up like magic, richer in a decade than the Old World cities have grown in centuries; when 120,000 miles of railroad have been built, which compress the broad expanse of a continent into a week of time; when the commerce of its inland lakes has grown to rival the commerce between the two worlds; when from every land under the sun the emigrants have been flocking to its happy shores, drawn there by the peace and prosperity which shine on all its borders and sweep from circumference to center. There are no eyes so dull that can not see the ever-rising glories of this republic except those which are bandaged by the prejudices of long ago."

In vindication of the theory of protection, he argued: "Man derives his greatest power from his association with other men, his union with his fellows. Whoever considers the human being as a creature alone, by himself, isolated and separated, and tries to comprehend mankind by mathematically adding these atoms together, has utterly failed to comprehend the human race and its tremendous mission.

"Sixty millions even of such creatures without association are only so many beasts that perish. But sixty millions of men welded together by national brotherhood, each supporting, sustaining, and buttressing the other, are the sure conquerors of all those mighty powers of nature which alone constitute the wealth of this world. The great blunder of the Herr Professor of political economy is that he treats human beings as if every man were so many foot-pounds, such and such a fraction of a horse-power. All the soul of man he leaves out.

"Think for a moment of the foundation principles involved in this question, which I now ask, Where does wealth come from? It comes from the power of man to let loose and yet guide those elemental forces the energy of which is infinite. It comes from the power of man to force the earth to give her increase, to

hold in the bellying sail the passing breeze, to harness the tumbling waterfall, to dam up the great rivers, to put bits in the teeth of the lightning. Foot-pounds and fractions of a horse-power will never do this. It takes brains and the union of foot-pounds and fractions of a horse-power working harmoniously together.

"For a nation to get out of itself or out of the earth all the wealth there is in both, it is not necessary for the nation to buy cheap or sell dear. That concerns individuals alone. What concerns the nation is how to utilize all the work there is in men, both of muscle and brain, of body and of soul, in the great enterprise of setting in motion the ever-gratuitous forces of nature.

"There is only one way to get the best work out of men, and that is to give each the work he can do best. You can only accomplish this by diversifying industry. To diversify industry completely in a country such as ours there is but one way given under Heaven among men. To enable the American people themselves to supply all their wants, you must give and assure to the American people the American markets. What does this phrase mean in practical life? It means that we, the nation, say to capital, 'Embark yourself in the manufacture of such and such articles and you shall have a market to the extent of the wants of the American people.'

"Capital then says to labor, 'Go with me into this new field, all of you who like this work best, and we will share the results.' Then begins a new industry. Multiply this by hundreds and you have a community where every man honestly minded will get what on the whole suits him best, and the nation will get the greatest amount of work from the greatest number."

Maintaining that the protective tariffs of the world have really cheapened production, Mr. Reed said: "Tariff taxes! How men like to fool themselves with phrases! Because the taxing power is used not only for revenue but as the barrier, and taxes are odious, therefore the barrier must be odious also. How can taxes produce? This is only mere word-trifling. Can you keep cattle out of the cornfield by sticking wood into the ground? Yes, if you make a fence.

"Do you mean to tell me, said the wise bumpkin to the engineer on the banks of the Merrimac, do you mean to tell me that you can make that stream useful by putting rocks into it? Yes, said the engineer, as he proceeded to build his dam and set in motion the water-wheels of mighty Lowell."

Alluding to the promise held out by free trade for a share in the business of the markets of the world, Mr. Reed said: "To hear these rhetoricians declaim, you would imagine the markets of the world a vast vacuum, waiting till now for American goods to break through, rush in, and fill the yearn-

ing void. Will your goods go to Austria, to Italy, Germany, Russia, or France? Around all these benighted countries are the 'Chinese' walls of tariff taxes. Britain herself is protected by vast capital, accumulated through ages, the spoils of her own and other lands, by a trade system as powerful as it is relentless. All these nations will contest with you the other countries which they already overflow.

"Does your mouth water over the prospect? What market do you give up for all this? Where is the best market in the world? Where the people have the most money to spend. Where have the people the most money to spend? Right here in the United States of America after twenty-seven years of protectionist rule. And you are asked to give up such a market for the markets of the world! Why, the history of such a transaction was told twenty-four hundred years ago. It is a classic. You will find it in the works of *Æsop*, the fabulist.

"Once there was a dog. He was a nice little dog. Nothing the matter with him except a few foolish free-trade ideas in his head. He was trotting along happy as the day, for he had in his mouth a nice shoulder of succulent mutton. By and by he came to a stream bridged by a plank. He trotted along, and, looking over the side of the plank, he saw the markets of the world and dived for them. A minute after he was crawling up the bank the wettest, the sickest, the nastiest, the most muttonless dog that ever swam ashore!"

Mr. Carlisle, of Kentucky, in closing the debate on the Democratic side, May 19, dwelt on the financial condition of the country: "It appears from the last official statement that there was in the Treasury at the close of the last month, including subsidiary and minor coins, the sum of \$186,143,357.95 over and above all the current liabilities of the Government. This was \$56,676,662.65 more than the surplus on hand on the 1st day of December, 1887, and shows that there has been since that date an average monthly increase of \$11,385,382.15. The surplus accumulation each month under the existing system of taxation is more than the total cost of the Government during the first two years of Washington's administration, while the aggregate sum is considerably in excess of the whole expenditure of the Government during the first eighteen years of its existence under the Constitution, including civil and miscellaneous expenses, war, navy, Indians, pensions, and interest on the public debt.

"Every dollar of this enormous sum has been taken by law from the productive industries and commercial pursuits of the people at a time when it was sorely needed for the successful prosecution of their business and under circumstances which afford no excuse whatever for the exaction. There is not a monarchical government in the world, however absolute its form or however arbitrary its power, that

would dare to extort such a tribute from its subjects in excess of the proper requirements of the public service; and the question which Congress is now compelled to determine is whether such a policy can be longer continued here in this country, where the people are supposed to govern in their own right and in their own interest."

In reference to the efforts made by the Treasury Department to employ the surplus on hand, Mr. Carlisle said: "On the 17th day of last month the Secretary of the Treasury, in pursuance of authority conferred upon him by the law of March, 1881, as interpreted by the two Houses of Congress, issued a circular inviting proposals for the sale of bonds to the Government. The first purchase was made under this invitation on the 18th day of April, and between that date and the close of business yesterday, a period of one month, he has purchased on account of the Government four-per-cent. bonds to the amount of \$18,456,500, upon which interest had accrued at the date of the purchase to the amount of \$53,172.07. For these bonds he was compelled to pay the sum of \$17,046,186.06, which was \$3,586,464 more than the principal and accrued interest, or a premium of 26½ per cent. During the same time and under the same authority he purchased 4½-per-cent. bonds to the amount of \$12,404,450, upon which interest had accrued to the amount of \$108,086.55. For these bonds he paid the sum of \$13,379,188.37, which was \$866,652.87 in excess of the principal and interest. The premium paid upon this class of bonds was nearly seven per cent.

"This is the situation into which the Government has been forced by the failure of Congress in past years to make provision for a reduction of taxation. Millions of dollars which ought to have remained in the hands of the people who earned the money by their labor and by their skill in the prosecution of business have been taken away from them by law to be paid out to the bondholders in excess of their legal demands against the Government. And, sir, if the present Congress shall adjourn without applying a remedy, this unjust process must go on for an indefinite length of time. In the presence of such a situation we can not afford to quarrel about trivial details. A reduction of the revenue—not by increasing taxation, as some propose, but by diminishing taxation in such manner as will afford the largest measure of relief to the people and their industries—should be the great and controlling object to which everything else should be subordinated. I do not mean that every interest, however small and insignificant, should not be carefully considered in a friendly spirit, but I do mean that the general interests of the many should not be subordinated to the special interests of the few."

In reference to the theoretical question underlying the issue of tariff reduction, Mr. Carlisle

said: "Although the question now presented is purely a practical one, it necessarily involves, to some extent, a discussion of the conflicting theories of taxation which have divided the people of this country ever since the organization of the Government. There is a fundamental and irreconcilable difference of opinion between those who believe that the power of taxation should be used for public purposes only, and that the burdens of taxation should be equally distributed among all the people according to their ability to bear them, and those who believe that it is the right and duty of the Government to promote certain private enterprises and increase the profits of those engaged in them by the imposition of higher rates than are necessary to raise revenue for the proper administration of public affairs; and so long as this difference exists, or at least so long as the policy of the Government is not permanently settled and acquiesced in, these conflicting opinions will continue to embarrass the representatives of the people in their efforts either to increase or reduce taxation.

"While no man in public life would venture to advocate excessive taxation merely for the purpose of raising excessive revenue, many will advocate it, or at least excuse it, when the rates are so adjusted or the objects of taxation are so selected as to secure advantages, or supposed advantages, to some parts of the country or to some classes of industries over other parts and other classes; and this, Mr. Chairman, is the sole cause of the difficulties we are now encountering in our efforts to relieve the people and reduce the surplus. It is the sole cause of the unfortunate delay that has already occurred in the revision of our revenue laws, and if the pending bill shall be defeated and disaster in any form shall come upon the country by reason of overtaxation and an accumulation of money in the Treasury, this unjust feature in our present system will be responsible for it.

"Whenever an attempt is made to emancipate labor from the servitude which an unequal system of taxation imposes upon it, whenever it is proposed to secure as far as possible to each individual citizen the full fruits of his own earnings, subject only to the actual necessities of the Government, and whenever a measure is presented for the removal of unnecessary restrictions from domestic industries and international commerce, so as to permit freer production and freer exchanges, the alarm is sounded and all the cohorts of monopoly are assembled to hear their heralds proclaim the immediate and irretrievable ruin of the country."

Mr. Carlisle cited cases in which business prosperity had followed tariff reduction; and conceding that a general movement toward higher wages and lower prices for manufactures had prevailed for years here and elsewhere, he held that the result was due to other causes than protection in cases where it accompanied

protection: "Mr. Chairman, it has been stubbornly contended all through this debate that high rates of duty upon imported goods are beneficial to the great body of consumers, because such duties, instead of increasing the price of the domestic articles of the same kind, actually reduce the prices. If this be true, all the other arguments in support of the existing system are not only superfluous, but manifestly unsound. The proposition that a high tariff enables the producer to pay higher wages for his labor, and the proposition that it also reduces the prices of the articles he has to sell, which are the products of that labor, are utterly inconsistent with each other, and no ingenuity of the casuist can possibly reconcile them. Labor is paid out of its own product, and unless that product can be sold for a price which will enable the employer to realize a reasonable profit and pay the established rates of wages, the business must cease or the rates of wages must be reduced. When the price of the finished product is reduced by reason of the increased efficiency of labor, or by reason of the reduced cost of the raw material, the employer may continue to pay the same or even a higher rate of wages and still make his usual profits. But the tariff neither increases the efficiency of labor nor reduces the cost of the raw material.

"I do not deny that prices have greatly fallen during the last fifty years, not only in this country, but all over the civilized world—in free-trade countries as well as in protectionist countries. Nor do I deny that during the same time the general tendency has been toward an increase in the rates of wages; and this is true also of all civilized countries, free-trade and protection alike. It is not possible for me now to enumerate, much less discuss, all the causes that have contributed to these results. One of the most efficient causes, in fact the most efficient cause, is the combination of skilled labor with machinery in the production of commodities. The introduction and use of improved machinery has wrought a complete revolution in nearly all our manufacturing industries, and in many cases has enabled one man to do the work which it required one hundred men to do before. Here is a statement furnished by the United States Commissioner of Labor to the chairman of the Committee on Ways and Means, showing the value of the product of a week's labor in spinning cotton yarn by hand and the value of the product of a week's labor combined with machinery in the same industry: In 1813, one man working sixty hours by hand could turn out three pounds of cotton yarn, worth \$2.25, or seventy-five cents per pound; now the same man, if he were living, could turn out in sixty hours with the use of machinery 8,000 pounds of cotton yarn of the same character, worth \$450, or fifteen cents per pound. The cotton-spinner now receives as wages for his week's work more than three times as much as the

total value of the product of a week's work, including the value of the material, in 1813; and yet labor is far cheaper to the employer now than it was then. Although the employer now receives only one fifth as much per pound for his cotton yarn as he did in 1813, he realizes from the sale of the products of a week's labor just two hundred times as much as he did then.

"I have also a statement prepared by the same official, showing the relative production and value of product of a weaver using hand and power machinery, from which it appears that a weaver by hand turned out in seventy-two hours in 1813 45 yards of cotton goods (shirting), worth \$17.91, while a weaver now, using machinery, turns out in sixty hours 1,440 yards, worth \$108. Substantially the same exhibit could be made in regard to a very large number of our manufacturing industries.

"It is strange, Mr. Chairman, in view of these facts, that the prices of manufactured goods have fallen or that the wages of the laborers who produce them have risen? Is it not, on the contrary, remarkable that there has not been a greater fall in prices and a greater increase in wages? Undoubtedly there would have been a greater reduction in prices and a greater increase in wages if there had been a wider market for the products and a lower cost for the material.

"The tremendous productive forces at work all over the world in these modern times, and the small cost of manual labor in comparison with the value of the products of these combined forces, can not be realized from any general statement upon the subject. In order to form some idea of the magnitude of these natural and mechanical forces, and the efficiency of manual labor and skill when connected with them, let us look at the situation in six of our own manufacturing industries. In the manufacture of cotton goods, woolen goods, iron and steel, sawed lumber, paper, and in our flouring and grist mills, there were employed, according to the latest statistics, 517,299 persons, not all men, but many of them women and children. This labor was supplemented by steam and water power equal to 2,496,299 horse-power. This is equal to the power of 14,977,794 men; and thus we find that a little over 517,000 persons of all ages and sexes are performing, in connection with steam and water power, the work of 15,495,098 adult and healthy men.

"The railroad, the steam-vessel, the telegraph, the improved facilities for the conduct of financial transactions, and many other conveniences introduced into our modern systems of production and distribution and exchange have all contributed their share toward the reduction of prices, and it would be interesting to inquire what their influence has been, but I can not pursue this particular subject further without occupying too much time."

Touching upon the necessity for foreign markets for our agricultural products, Mr. Carlisle said: "Of course our home market has been constantly improving, and under any system of taxation will continue to improve to a greater or less extent with the increase of population and wealth, the extension of the use of machinery, which reduces the cost of production, and the multiplication of facilities for communication and transportation, which reduces the cost of distribution. But how long, Mr. Chairman, are our farmers to be compelled to pay tribute to other industries and wait for the creation of a home market that will take all their own products at fair prices? Among our greatest agricultural products are wheat and cotton. They constitute the main reliance of millions of our people for a profitable use of their lands, and many hundred million dollars are invested in the soil and buildings and machinery devoted to their production. Taking the average crop of wheat in this country for several years past, and assuming that there shall be no increase whatever in production, and that the domestic consumption per capita shall remain just at what it now is, there would still be no sufficient home market for this great agricultural staple until our population had reached nearly one hundred million.

"The official statistics of the domestic production, exportation, and home consumption of raw cotton show that it would require three times as much machinery and three times as many operatives as we now have to convert this material into commercial fabrics here at home; in other words, we are now compelled to export two thirds of our product to be manufactured in foreign countries, while one third only is manufactured at home by all the machinery and labor now employed. In 1880 there were \$219,505,000 invested in cotton manufactures, and there were employed in that industry 172,554 hands. To work up our present production of raw cotton would require an investment in this manufacture of \$660,000,000 and the employment of 517,662 hands. If we have been more than one hundred years, part of the time under very high tariffs, in so developing our cotton manufactures as to enable them to take one third of our product at European prices, how many more centuries will be required to enable them to consume the whole product at prices fixed by competition here at home? When gentlemen have solved this problem to the satisfaction of the American cotton-grower, he may be able to listen with patience to the arguments by which they attempt to convince him of the immense advantages of a home market that will never exist. What is to be done with these great agricultural products, and with many others which are now exported, while the farmers are waiting for the home market which the advocates of restrictive legislation have been promising them for so many years? Are the farmers and planters of

the North and South to abandon their wheat and cotton lands or cultivate crops not suited to their soil or climate while gentlemen are making experiments to ascertain whether or not a home market may not be created by legislation? No, sir. No matter what gentlemen may predict or what they may promise, these great industries must go on, and the American farmer must sell his products in any market he can reach and at any price he can get."

It would be impossible to follow the whole course of the debate or to take up the discussion of particular points; but these extracts from the speeches of acknowledged leaders may serve to indicate the general character of the arguments. The Mills Bill passed the House of Representatives, July 21, by the following vote:

YEAS—Abbott, Allen of Mississippi, Anderson of Iowa, Anderson of Mississippi, Anderson of Illinois, Bacon, Bankhead, Barnes, Barry, Biggs, Blanchard, Bland, Blount, Breckinridge of Arkansas, Breckinridge of Kentucky, Brower, Bryce, Buckalew, Burnes, Burnett, Bynum, F. Campbell of New York, Campbell of Ohio, T. J. Campbell of New York, Candler, Carlton, Caruth, Catchings, Chipman, Clardy, Clements, Cobb, Cockran, Collins, Compton, Cothran, Cowles, Cox, Crain, Crisp, Culberson, Cummings, Dargan, Davidson of Alabama, Davidson of Florida, Dibble, Dockery, Dougherty, Dunn, Elliott, Enloe, Ermentrout, Fisher, Fitch, Ford, Forney, French, Gay, Gibson, Glass, Grimes, Hall, Hare, Hatch, Hayes, Heard, Hemphill, Henderson of North Carolina, Herbert, Holman, Hooker, Hopkins of Virginia, Howard, Hudd, Hutton, Johnston of North Carolina, Jones, Kilgore, Laffoon, Lagan, Landes, Lane, Latham, Latham, Lawler, Lee, Lynch, Macdonald, Mahoney, Maish, Mansur, Martin, Matson, McAdoo, McClammy, McCreary, McKinney, McMillin, McRae, McShane, Mills, Montgomery, Moore, Morgan, Morse, Neal, Nelson, Newton, Norwood, Oates, O'Ferrall, O'Neill of Indiana, O'Neill of Missouri, Outhwaite, Peel, Penington, Phelan, Pidcock, Rayner, Rice, Richardson, Robertson, Rogers, Rowland, Russell of Massachusetts, Rusk, Sayers, Scott, Seney, Shaw, Shively, Simmons, Smith, Snyder, Spinoia, Springer, Stahlnecker, Stewart of Texas, Stewart of Georgia, Stockdale, Stone of Kentucky, Stone of Missouri, Taraney, Taulbee, Thompson of California, Tillman, Tracey, Townshend, Turner of Georgia, Vance, Walker, Washington, Weaver, Wheeler, Whitthorne, Wilkins, Wilkinson, Wilson of Minnesota, Wilson of West Virginia, Wise, Yoder, Carlisle, Speaker—162.

NAYS—Adams, Allen of Massachusetts, Allen of Michigan, Anderson of Kansas, Arnold, Atkinson, Baker of New York, Baker of Illinois, Bayne, Belden, Bingham, Bliss, Boothman, Bound, Boutelle, Bowden, Bowen, Brewer, T. H. B. Browne of Virginia, Brown of Ohio, J. R. Brown of Virginia, Brumm, Buchanan, Bunnell, Burrows, Butler, Butterworth, Cannon, Caswell, Cheadle, Clark, Cogswell, Conger, Cooper, Crouse, Cutcheon, Dalzell, Darlington, Davis, De Lano, Dingley, Dorsey, Dunham, Farquhar, Felton, Finley, Flood, Fuller, Funston, Gains, Gallinger, Gear, Gest, Goff, Greenman, Grosvenor, Grout, Guenther, Harmer, Haugen, Hayden, Henderson of Iowa, Henderson of Illinois, Hermann, Hires, Hitt, Holmes, Hopkins of Illinois, Hopkins of New York, Houk, Hovey, Hunter, Jackson, Johnston of Indiana, Kean, Kelley, Kennedy, Kerr, Ketcham, La Follette, Laidlaw, Laird, Lehlbach, Lind, Lodge, Long, Lyman, Mason, McComas, McCormick, McCulloch, McKenna, McKinley, Merriman, Milliken, Moffitt, Morrill, Morrow, Nichols, Nutting, O'Donnell, O'Neill of Pennsylvania, Osborne, Owen, Parker, Patton, Payson, Per-

kins, Peters, Phelps, Plumb, Post, Pugsley, Reed, Rockwell, Romeis, Russell of Connecticut, Ryan, Sawyer, Scull, Seymour, Sherman, Sowden, Steele, Stephenson, Stewart of Vermont, Struble, Symes, E. B. Taylor of Ohio, J. D. Taylor of Ohio, Thomas of Kentucky, Thomas of Illinois, Thomas of Wisconsin, Thompson of Ohio, Turner of Kansas, Vandever, Wade, Warner, Weber, West, White of Indiana, White of New York, Whiting of Massachusetts, Wickham, Wilber, Williams, Yardley, Yost—149.

Not Voting—Belmont, Browne of Indiana, Davenport, Foran, Glover, Granger, Hiestand, Hogg, Moffatt, Perry, Randall, Spooner, Whiting of Michigan, Woodburn—14.

The only Republicans who voted for the bill were Brower of North Carolina, Fitch of New York, and Nelson of Minnesota. The only Democrats who voted against it were Bliss, Greenman, and Merriman of New York, and Sowden of Pennsylvania. Randall of Pennsylvania was paired against the bill with a Democrat who favored it.

The text of the Mills Bill, which formed the main issue in the Presidential canvass, is given as a matter of record:

Be it enacted, &c., That on and after the 1st day of October, 1888, the following articles mentioned in this section, when imported, shall be exempt from duty:

Timber, hewed and sawed, and timber used for spars and in building wharves.

Timber squared or sided.

Wood unmanufactured, not specially enumerated or provided for.

Sawed boards, planks, deals, and all other articles of sawed lumber.

Hubs for wheels, posts, last-blocks, wagon-blocks, car-blocks, gun-blocks, heading-blocks, and all like blocks or sticks, rough, hewed, or sawed only.

Staves of wood.

Pickets and palings.

Laths.

Shingles.

Clapboards, pine or spruce.

Logs.

Provided, That if any export duty is laid upon the above-mentioned articles, or either of them, by any country whence imported, all said articles imported from said country shall be subject to duty as now provided by law.

Salt, in bags, sacks, barrels, or other packages, or in bulk, when imported from any country which does not charge an import duty upon salt exported from the United States.

Flax straw.

Flax, not hackled or dressed.

Tow of flax, or hemp.

Hemp, manila, and other like substitutes for hemp.

Jute-butts.

Jute.

Sunn, sisal-grass, and other vegetable fibers.

Burlaps, not exceeding 60 inches in width, of flax, jute, or hemp, or of which flax, jute, or hemp, or either of them, shall be the component material of chief value.

Bags of jute for grain.

Machinery designed for the conversion of jute or jute-butts into cotton-bagging, to wit, cards, roving-frames, winding-frames, and softeners.

Iron or steel sheets, or plates, or taggers iron, coated with tin or lead, or with a mixture of which these metals is a component part, by the dipping or any other process, and commercially known as tin-plates,terne-plates, and taggers tin.

Beeswax.

Glycerine, crude, brown, or yellow, of the specific

gravity of 1.25 or less at a temperature of 60° Fahr., not purified by refining or distilling.

Phosphorus.

Soap-stocks, fit only for use as such.

Soap, hard and soft, all which are not otherwise specially enumerated or provided for.

Sheep-dip.

Extract of hemlock, and other bark used for tanning.

Indigo, extracts of, and carmined.

Iodine, resublimed.

Oil, croton.

Hemp-seed and rape-seed oil.

Petroleum.

Alumina—alum, patent alum, alum substitute, sulphate of alumina, and aluminous cake, and alum in crystals or ground.

All imitations of natural mineral waters, and all artificial mineral waters.

Baryta, sulphate of, or barytes, unmanufactured.

Boracic acid, borate of lime, and borax.

Copper, sulphate of, or blue vitriol.

Iron, sulphate of, or copperas.

Potash, crude, carbonate of, or fused, and caustic potash.

Chlorate of potash and nitrate of potash, or saltpeter crude.

Sulphate of potash.

Sulphate of soda, known as salt-cake, crude or refined, or niter-cake, crude or refined, and Glauber's salt.

Nitrate of soda.

Sulphur, refined, in rolls.

Wood-tar.

Coal-tar, crude.

Aniline oil and its homologues.

Coal-tar, products of, such as naphtha, benzine, benzole, dead oil, and pitch.

All preparations of coal-tar not colors or dyes, and not acids of colors and dyes.

Log-wood and other dyewoods, extracts and decoctions of.

Alizarine, natural or artificial.

Spirits of turpentine.

Ocher and ochery earths, umber and umber earths.

Olive-oil, salad-oil, cottonseed-oil, whale-oil, seal-oil and neat's-foot oil.

All barks, beans, berries, balsams, buds, bulbs, bulbous roots, and excrescences, such as nut-galls, fruits, flowers, dried fibers, grains, gums, and gum-resins, herbs, leaves, lichens, mosses, nuts, roots, and stems, vegetables, seeds, and seeds of morbid growth, weeds, woods used expressly for dyeing, and dried insects, any of the foregoing which are not edible and not specially enumerated or provided for.

All non-diatable crude minerals, but which have been advanced in value or condition by refining or grinding, or by other process of manufacture, not specially enumerated or provided for.

All earths or clays unwrought or unmanufactured.

Glass plates or disks unwrought, for use in the manufacture of optical instruments, spectacles, and eyeglasses.

Opium, crude and not adulterated, containing 9 per cent. and over of morphia, for medicinal purposes.

Iron and steel cotton ties for hoops, for baling or other purposes, not thinner than No. 20 wire gauge.

Needles, sewing, darning, knitting, and all others not specially enumerated or provided for in this act.

Copper, imported in the form of ores, regulus of, and black or coarse copper and copper cement, old copper fit only for remanufacture.

Antimony, as regulus or metal.

Quicksilver.

Chromate of iron or chromic ore.

Mineral substances in a crude state and metals unwrought not specially enumerated or provided for.

Brick, other than fire-brick.

German looking-glass plates, made of blown glass and silvered.

Vegetables in all their natural state or in salt or brine, not specially enumerated or provided for.

Chicory-root, ground or unground, burned or prepared.

Acorns and dandelion-root, raw or prepared, and all other articles used, or intended to be used, as coffee or substitutes therefor, not specially enumerated or provided for.

Cocoa, prepared or manufactured.

Dates.

Currants, Zante or other.

Figs.

Meats, game and poultry.

Milk, fresh.

Egg-yolks.

Beans, peas, and split peas.

Bibles, books, and pamphlets, printed in other languages than English, and books and pamphlets and all publications of foreign governments, and publications of foreign societies, historical or scientific, printed for gratuitous distribution.

Bristles.

Hulbs and bulbous roots, not medicinal.

Feathers of all kinds, crude or not dressed, colored, or manufactured.

Finishing powder.

Grease.

Grindstones, finished or unfinished.

Curled hair, for beds or mattresses.

Human hair, raw, uncleaned and not drawn.

Hemp and rape seed, and other oil-seeds of like character.

Garden seeds.

Osier or willow, prepared for basket-makers' use.

Broom-corn.

Brush-wood.

Rags, of whatever material composed.

Rattans and reeds, manufactured but not made up into finished articles.

Stones, manufactured or undressed, freestone, granite, sandstone, and all building or monumental stone.

All strings of gut or any other like material.

Tallow.

Waste, all not specially enumerated or provided for. Sec. 2. That on the 1st day of October, 1888, in lieu of the duties heretofore imposed on the articles hereinafter mentioned, there shall be levied, collected, and paid the following rates of duty on said articles severally:

Glycerine, refined, 3 cents per pound.

Acid, acetic, aceticus, or pyroligneous acid, exceeding the specific gravity of 1.047, 5 cents per pound.

Castor beans or seeds, 25 cents per bushel of 50 pounds.

Castor-oil, 40 cents per gallon.

Flaxseed or linseed oil, 15 cents per gallon.

Licorice, paste or rolls, 5 cents per pound.

Licorice-juice, 85 per cent. ad valorem.

Baryta, sulphate of, or barytes, manufactured, one eighth of 1 cent per pound.

Chromate of potash, 24 cents per pound.

Bichromate of potash, 24 cents per pound.

Acetate of lead, brown, 2 cents per pound.

Acetate of lead, white, 3 cents per pound.

White lead, when dry or in pulp, or when ground or mixed in oil, 2 cents per pound.

Orange mineral, and red lead, 14 cent per pound.

Litharge, 14 cent per pound.

Nitrate of lead, 2 cents per pound.

Magnesia, medicinal, carbonate of, 3 cents per pound.

Magnesia, calcined, 7 cents per pound.

Magnesia, sulphate of, or Epsom salts, one fourth of 1 cent per pound.

Prussiate of potash, red, 7 cents per pound.

Prussiate of potash, yellow, 8 cents per pound.

Nitrate of potash, refined, or refined saltpeter, 1 cent per pound.

Sal-soda, or soda crystals, one eighth of 1 cent per pound.

Bicarbonate of or supercarbonate of soda, and saleratus, calcined or pearlash, three-fourths of 1 cent per pound.

Hydrate or caustic soda, one half of 1 cent per pound.

Soda silicate or other alkaline silicate, one fourth of 1 cent per pound.

Sulphur, sublimed or flowers of, \$12 per ton.

Ultramarine, 3 cents per pound.

Paris green, 12½ per cent. ad valorem.

Colors and paints, including lakes, whether dry or mixed, or ground with water or oil, not specially enumerated or provided for, 20 per cent. ad valorem.

Zinc, oxide of, when dry, 1 cent per pound; when ground in oil, 14 cent per pound.

All medicinal preparations known as cerates, conserves, decoctions, emulsions, extracts, solid or fluid, infusions, juices, liniments, lozenges, mixtures, mucilages, ointments, oleo-resins, pills, plasters, powders, resins, suppositories, sirups, vinegars, and waters, of any of which alcohol is not a component part, which are not specially enumerated or provided for, 20 per cent. ad valorem.

All ground or powdered spices not specially enumerated or provided for, 3 cents per pound.

Proprietary preparations, to wit: All cosmetics, pills, powders, troches or lozenges, sirups, cordials, bitters, anodynes, tonics, plasters, liniments, salves, ointments, pastes, drops, waters, essences, spirits, oils, or preparations or compositions recommended to the public as proprietary articles or prepared according to some private formula as remedies or specifics for any disease or diseases or affections affecting the human or animal body, including all toilet preparations whatever used as applications to the hair, mouth, teeth, or skin, not specially enumerated or provided for, 30 per cent. ad valorem.

Morphia or morphine and all salts thereof, 50 cents per ounce.

Acid, tannic or tannin, 50 cents per pound.

China, porcelain, parian, and bisque, earthen, stone, or crockery ware composed of earthy or mineral substance, including plaques, ornaments, charms, vases, and statuettes, painted, printed, enameled, or gilded, or otherwise decorated in any manner, 50 per cent. ad valorem.

China, porcelain, parian, and bisque ware not decorated in any manner, 40 per cent. ad valorem.

White granite, common ware, plain white or cream-colored, lustered or printed under glaze in a single color; sponged, dipped, or edged ware, 35 per cent. ad valorem.

Brown earthenware, common stoneware, gas-reports, and roofing-tiles, not specially enumerated or provided for, and not decorated in any manner, 20 per cent. ad valorem.

All other earthen, stone, and crockery ware, white, colored, or bisque, composed of earthy or mineral substances, not specially enumerated or provided for in this act, and not decorated in any manner, 35 per cent. ad valorem.

Paving-tiles, not encaustic, 20 per cent. ad valorem.

Encaustic tiles, not glazed or enameled, 30 per cent. ad valorem.

All glazed or enameled tiles, 40 per cent. ad valorem.

Slates, slate-pencils, slate chimney-pieces, mantels, slabs for tables, and all other manufactures of slate, 20 per cent. ad valorem.

Green and colored glass bottles, vials, demijohns, and carboys (covered or uncovered), pickle or preserve jars, and other plain, molded, or pressed green and colored bottle-glass, not cut, engraved, or painted, and not specially enumerated or provided for, 1 cent per pound; if filled, and not otherwise provided for, and the contents are subject to an ad valorem duty, or to a rate of duty based on their value, the value of such bottles, vials, or other vessels shall be added to the value of the contents for the ascertainment of the dutiable value of the latter; but if filled and not otherwise provided for, and the contents are not subject to

an ad valorem duty or to a rate of duty based on their value, they shall pay a duty of 1 cent per pound in addition to the duty, if any, on their contents.

Cylinder and crown glass, polished, above 24 by 30 inches square and not exceeding 24 by 60 inches square, 20 cents per square foot; all above that 30 cents per square foot.

Unpolished cylinder, crown, and common window-glass, not exceeding 10 by 15 inches square, 1½ cent per pound; above that, and not exceeding 16 by 24 inches square 1½ cents per pound; above that, and not exceeding 24 by 30 inches square, 2 cents per pound; all above that 2½ cents per pound: *Provided*, That unpolished cylinder, crown, and common window-glass, imported in boxes containing 50 square feet as nearly as sizes will permit, now known and commercially designated as 50 feet of glass, single thick and weighing not to exceed 55 pounds of glass per box, shall be entered and computed as 50 pounds of glass only; and that said kinds of glass imported in boxes containing, as nearly as sizes will permit, 50 feet of glass, now known and commercial y designated as 50 feet of glass, double thick and not exceeding 90 pounds in weight, shall be entered and computed as 30 pounds of glass only; but in all other cases the duty shall be computed according to the actual weight of glass.

Cast polished plate-glass, silvered, or looking-glass plates, above 24 by 30 inches square and not exceeding 24 by 60 inches square, 25 cents per square foot; all above that, 45 cents per square foot.

Porcelain and Bohemian glass, chemical glassware, painted glassware, stained glass, and all other manufactures of glass, or of which glass shall be the component material of chief value, not specially enumerated or provided for, 40 per cent. ad valorem.

Iron in pigs, iron kentledge, \$6 per ton.
Iron railway bars, weighing more than 25 pounds to the yard, \$11 per ton.

Steel railway bars and railway bars made in part of steel, weighing more than 25 pounds to the yard, \$11 per ton.

Bar-iron, rolled or hammered, comprising flats not less than 1 inch wide nor less than three eighths of 1 inch thick, seven tenths of 1 cent per pound; comprising round iron not less than three fourths of 1 inch in diameter, and square iron not less than three fourths of 1 inch square, and flats less than 1 inch wide or less than three eighths of 1 inch thick, round iron less than three fourths of 1 inch and not less than seven sixteenths of 1 inch in diameter, and square iron less than three fourths of 1 inch square, 1 cent per pound: *Provided*, That all iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig-iron, except castings, shall be rated as iron in bars, and pay a duty accordingly; and none of the above iron shall pay a less rate of duty than 35 per cent. ad valorem: *Provided further*, That all iron bars, blooms, billets, or sizes or shapes of any kind, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of not less than \$20 per ton.

Iron or steel T-rails, weighing not over 25 pounds to the yard, \$14 per ton; iron or steel flat rails, punched, \$15 per ton.

Round iron, in coils or rods, less than seven sixteenths of 1 inch in diameter, and bars or shapes of rolled iron, not specially enumerated or provided for, 1 cent per pound.

Iron or steel, flat with longitudinal ribs, for the manufacture of fencing, four tenths of 1 cent per pound.

Sheet-iron, common or black, thinner than 1 inch and not thinner than No. 20 wire gauge, 1 cent per pound; thinner than No. 20 wire gauge and not thinner than No. 25 wire gauge, one and one tenth of 1 cent per pound; thinner than No. 25 wire gauge and not thinner than No. 29 wire gauge, one and one fourth of 1 cent per pound; thinner than No. 29 wire gauge, and all iron commercially known as common

or black taggers iron, whether put up in boxes or bundles or not, 30 per cent. ad valorem: *Provided*, That on all such iron and steel sheets or plates aforesaid, excepting on what are known commercially as tin-plates,terne-plates, and taggers tin, when galvanized or coated with zinc or spelter, or other metals, or any alloy of those metals, one fourth of 1 cent per pound additional when not thinner than No. 20 wire gauge; thinner than No. 20 wire gauge and not thinner than No. 25 wire gauge, one half cent per pound additional, and when thinner than No. 25 wire gauge, three fourths of 1 cent per pound additional.

Hoop or band or scroll or other iron, 8 inches or less in width, and not thinner than No. 10 wire gauge, 1 cent per pound; thinner than No. 10 wire gauge and not thinner than No. 20 wire gauge, 1½ cent per pound; thinner than No. 20 wire gauge, 1¾ cent per pound: *Provided*, That all articles not specially enumerated or provided for, whether wholly or partly manufactured, made from sheet, plate, hoop, band, or scroll iron herein provided for, or of which such sheet, plate, hoop, band, or scroll iron shall be the material of chief value, shall pay one fourth of 1 cent per pound more duty than that imposed on the iron from which they are made, or which shall be such material of chief value.

Cast-iron pipe, six tenths of 1 cent per pound.

Cut nails and spikes, of iron or steel, 1 cent per pound.

Cut tacks, brads, or sprigs, 35 per cent. ad valorem.
Iron or steel railway fish-plates or splice-bars, eight tenths of 1 cent per pound.

Wrought-iron or steel spikes, nuts, and washers, and horse, mule, or ox shoes, 1½ cent per pound.

Anvils, anchors, or parts thereof, mill-irons and mill-cranks, of wrought-iron, and wrought-iron for ships, and forgings of iron and steel, for vessels, steam-engines, and locomotives, or parts thereof, weighing each 25 pounds or more, 1½ cent per pound.

Iron or steel rivets, bolts, with or without threads or nuts, or bolt-blanks, and finished hinges or hinge-blanks, 1½ cent per pound.

Iron or steel blacksmiths' hammers and sledges, track-tools, wedges, and crowbars, 1½ cent per pound.

Iron or steel axles, parts thereof, axle-bars, axle-blanks, or forgings for axles, without reference to the stage or state of manufacture, 1½ cent per pound.

Horseshoe-nails, hob-nails, and wire nails, and all other wrought-iron or steel nails, not specially enumerated or provided for, 2½ cents per pound.

Boiler-tubes or other tubes or flues or stays, of wrought-iron or steel, 1½ cent per pound.

Chain or chains, of all kinds, made of iron or steel, less than three fourths of 1 inch in diameter, 1½ cent per pound; less than three fourths of 1 inch and not less than three eighths of 1 inch in diameter, 1½ cent per pound; less than three eighths of 1 inch in diameter, 2 cents per pound.

Hand, back, and all other saws, not specially enumerated or provided for, 30 per cent. ad valorem.

Files, file-blanks, rasps, and floats of all cuts and kinds, 35 per cent. ad valorem.

Iron or steel beams, girders, joists, angles, channels, car-truck channels, TT columns and posts, or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, six tenths of 1 cent per pound.

Steel wheels and steel-tired wheels for railway purposes, whether wholly or partly finished, and iron or steel locomotive, car, and other railway tires, or parts thereof, wholly or partly manufactured, 2 cents per pound; iron or steel ingots, cogged ingots, blooms or blanks for the same without regard to the degree of manufacture, 1½ cent per pound.

Iron and steel wire and iron and steel wire galvanized, and all manufactures of iron and steel wire and of iron and steel wire galvanized shall pay the duties now provided by law: *Provided*, That no such duty shall be in excess of 60 per cent. ad valorem.

Clippings from new copper, fit only for manufacture, 1 cent per pound.

Copper in plates, bars, ingots, Chili or other pigs, and in other forms, not manufactured, 2 cents per pound; in rolled plates, called braziers' copper, sheets, rods, pipes, and copper bottoms, 30 per cent. ad valorem.

Lead-ore and lead-dross, three fourths of 1 cent per pound.

Lead, in pigs and bars, molten and old refuse lead run into blocks, and bars and old scrap lead fit only to be remanufactured, 14 cent per pound. Lead in sheets, pipes, or shot, 24 cents per pound.

Sheathing or yellow metal, 30 per cent. ad valorem.

Nickel, in ore or matte, 10 cents per pound on the nickel contained therein.

Zinc-ores, 20 per cent. ad valorem.

Zinc-spelter, or tuteneague, in blocks or pigs, and old worn-out zinc fit only to be remanufactured, 14 cent per pound; zinc, spelter, or tuteneague, in sheets, 2 cents per pound.

Hollowware, coated, glazed, or tinned, 24 cents per pound.

Needles for knitting and sewing-machines, 20 per cent. ad valorem.

Pens, metallic, 35 per cent. ad valorem.

Type metal, 15 per cent. ad valorem.

New type for printing, 15 per cent. ad valorem.

Manufactures, articles, or wares, not specially enumerated or provided for, composed wholly or in part of copper, 35 per cent. ad valorem; manufactures, articles, or wares, not specially enumerated or provided for, composed of iron, steel, lead, nickel, pewter, tin, zinc, gold, silver, platinum, or any other metal, or of which any of the foregoing metals may be the component material of chief value, and whether partly or wholly manufactured, 40 per cent. ad valorem.

Cabinet and house furniture of wood, finished, 30 per cent. ad valorem.

Manufactures of cedar wood, granadilla, ebony, mahogany, rosewood, and satinwood, 30 per cent. ad valorem.

Manufactures of wood, or of which wood is the chief component part, not specially enumerated or provided for, 30 per cent. ad valorem.

All sugars not above No. 18 Dutch standard in color shall pay duty on their polariscopic test as follows, namely:

All sugars not above No. 18 Dutch standard in color, all tank-bottoms, sirups of cane-juice or of beet-juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, shall pay a duty of 1.15 cent per pound, and for every additional degree or fraction of a degree shown by the polariscopic test they shall pay thirty-two thousandths of 1 cent per pound additional.

All sugars above No. 18 Dutch standard in color shall be classified by the Dutch standard of color, and pay duty as follows, namely:

All sugars above No. 18 and not above No. 16 Dutch standard, 2 20 cents per pound.

All sugars above No. 16 and not above No. 20 Dutch standard, 2.40 cents per pound.

All sugars above No. 20 Dutch standard, 2.80 cents per pound.

Molasses testing not above fifty-six degrees by the polariscope shall pay a duty of 24 cents per gallon; molasses testing above fifty-six degrees shall pay a duty of 6 cents per gallon: *Provided*, That if an export duty shall hereafter be laid upon sugar or molasses by any country whence the same may be imported, such sugar or molasses so imported shall be subject to duty as provided by law at the date of the passage of this act.

Sugar-candy, not colored, 5 cents per pound.

All other confectionery, 40 per cent. ad valorem.

Potato or corn starch, rice-starch, and other starch, 1 cent per pound.

Rice, cleaned, 2 cents per pound; uncleaned, or rice free of the outer hull and still having the inner cuticle on, 14 cent per pound.

Rice-flour and rice-meal, 15 per cent. ad valorem.

Paddy, or rice having the outer hull on, 1 cent per pound.

Raisins, 14 cent per pound.

Peanuts or ground-beans, three fourths of 1 cent per pound; shelled, 1 cent per pound.

Mustard, ground or preserved, in bottles or otherwise, 6 cents per pound.

Cotton thread, yarn, warps, or warp yarn, whether single or advanced beyond the condition of single by twisting two or more single yarns together, whether on beams or in bundles, skeins, or cops, or in any other form, valued at not exceeding 40 cents per pound, 35 per cent. ad valorem; valued at over 40 cents per pound, 40 per cent. ad valorem.

On all cotton cloth, 40 per cent. ad valorem.

Spool-thread of cotton, 40 per cent. ad valorem.

Flax, hackled, known as dressed line, \$10 per ton.

Brown and bleached linens, ducks, canvas, paddings, cot-bottoms, diapers, crash, huckabacks, handkerchiefs, lawns, or other manufactures of flax, jute, or hemp, or of which flax, jute, or hemp shall be the component material of chief value, not specially enumerated or provided for, 25 per cent. ad valorem: *Provided*, That cuffs, collars, shirts, and other manufactures of wearing apparel, made in whole or in part of linen, and not otherwise provided for, and hydraulic hose, 35 per cent. ad valorem.

Flax, hemp, and jute yarns, and all twines of hemp, jute, jute-butts, sunn, sisal-grass, ramie, and China-grass, 15 per cent. ad valorem.

Flax or linen thread, twine, and packed thread and all manufactures of flax, or of which flax shall be the component material of chief value, not specially enumerated or provided for, 25 per cent. ad valorem.

Oil-cloth foundations or floor-cloth canvas or bur-laps, exceeding 60 inches in width, made of flax, jute, or hemp, or of which flax, jute, or hemp, or either of them, shall be the component material of chief value, 25 per cent. ad valorem.

Oil-cloths for floors, stamped, painted, or printed, and on all other oil-cloth (except silk oil-cloth), and on water-proof cloth, not otherwise provided for, 25 per cent. ad valorem.

Gunny-cloth, not bagging, 15 per cent. ad valorem.

Bags and bagging, and like manufactures, not specially enumerated or provided for, including bagging for cotton composed wholly or in part of flax, hemp, jute, gunny-cloth, gunny-bags, or other material, three eighths of 1 cent per pound.

Tarred cables or cordage, 25 per cent. ad valorem.

Untarred manila cordage, 25 per cent. ad valorem.

All other untarred cordage, 25 per cent. ad valorem. Seines and seine and gilling twine, 25 per cent. ad valorem.

Sail-duck, or canvas for sails, 25 per cent. ad valorem. Russia and other sheetings of flax or hemp, brown or white, 25 per cent. ad valorem. All other manufactures of hemp or manila, or of which hemp or manila shall be a component material of chief value, not specially enumerated or provided for, 35 per cent. ad valorem.

Grass-cloth and other manufactures of jute, ramie, China and sisal-grass, not specially enumerated or provided for, 25 per cent. ad valorem: *Provided*, That as to jute, jute-butts, sunn, and sisal-grass, and manufactures thereof, except burlaps, not exceeding sixty inches in width, this act shall take effect Jan. 1, 1889; and as to flax, hemp, manila, and other like substitutes for hemp, and the manufactures thereof, upon July 1, 1889.

SEC. 8. On and after Oct. 1, 1888, there shall be admitted, when imported, free of duty: All wools, hair of the alpaca, goat, and other like animals. Wools on the skin. Woolen rags, shoddy, mungo, waste, and flocks.

And on and after Jan. 1, 1889, in lieu of the duties

heretofore imposed on the articles hereinafter mentioned in this section, there shall be levied, collected, and paid the following rates of duty on said articles severally: Woolen and worsted cloths, shawls, and all manufactures of wool of every description, made wholly or in part of wool or worsted, not specially enumerated or provided for, 40 per cent. ad valorem.

Flannels, blankets, hats of wool, knit goods, and all goods made on knitting-frames, balmorals, woolen and worsted yarns, and all manufactures of every description, composed wholly or in part of wool or worsted, the hair of the alpaca, goat, or other animals, not specially enumerated or provided for, 40 per cent. ad valorem: *Provided*, That from and after the passage of this act, and until the 1st day of October, 1889, the Secretary of the Treasury be, and he is hereby, authorized and directed to classify as woolen cloth all imports of worsted cloth, whether known under the name of worsted cloth or under the name of "worsted" or "diagonals," or otherwise.

Bunting, 40 per cent. ad valorem. Women's and children's dress-goods, coat-linings, Italian cloths, and goods of like description, composed in part of wool, worsted, the hair of the alpaca, goat, or other animals, 40 per cent. ad valorem.

Clothing, ready-made, and wearing apparel of every description, not specially enumerated or provided for, and balmoral skirts and skirting, and goods of similar description or used for like purposes, composed wholly or in part of wool, worsted, the hair of the alpaca, goat, or other animals, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, except knit goods, 45 per cent. ad valorem.

Cloaks, dolmans, jackets, talmas, ulsters, or other outside garments for ladies' and children's apparel, and goods of similar description or used for like purposes, composed wholly or in part of wool, worsted, the hair of the alpaca, goat, or other animals, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer (except knit goods), 45 per cent. ad valorem.

Webbings, gorings, suspenders, braces, beltings, bindings, braids, galloons, fringes, gimps, cords, cords and tassels, dress-trimmings, head-nets, buttons, or barrel buttons, or buttons of other forms for tassels or ornaments wrought by hand or braided by machinery, made of wool, worsted, the hair of the alpaca, goat, or other animals, or of which wool, worsted, the hair of the alpaca, goat, or other animals is a component material, 50 per cent. ad valorem.

Hemp and jute carpeting 6 cents per square yard.

Floor-matting and floor-mats exclusively of vegetable substances 20 per cent. ad valorem.

"All other carpets and carpetings, druggets, bookings, mats, rugs, screens, covers, hassocks, bed-sides of wool, flax, cotton or parts of either or other material, 40 per cent. ad valorem."

Endless belts or felts for paper or printing machines, 30 per cent. ad valorem.

Sec. 4. That on and after the 1st day of October, 1888, in lieu of the duties heretofore imposed on the articles hereinafter mentioned, there shall be levied, collected, and paid the following rates of duty on said articles severally:

Paper, sized or glued, suitable only for printing paper, 15 per cent. ad valorem.

Printing paper, unsized, used for books and newspapers exclusively, 12 per cent. ad valorem.

Paper boxes, and all other fancy boxes, not otherwise provided for, 25 per cent. ad valorem.

Paper envelopes, 20 per cent. ad valorem.

Paper hangings, and paper for screens or fire-boards, surface-coated paper, and all manufactures of which surface-coated paper is a component material not otherwise provided for, and card-board, paper anti-quarian, demy, drawing, elephant, foolscap, imperial, letter, note, and all other paper not specially enumerated or provided for, 25 per cent. ad valorem.

Beads and bead ornaments of all kinds, except amber, 40 per cent. ad valorem.

Blackening of all kinds, 20 per cent. ad valorem.

Bonnets, hats, and hoods for men, women, and children, composed of hair, whalebone, or any vegetable material, and not specially enumerated or provided for, 30 per cent. ad valorem.

Brooms of all kinds, 20 per cent. ad valorem.

Brushes of all kinds, 20 per cent. ad valorem.

Canes and sticks, for walking, finished, 20 per cent. ad valorem.

Card clothing, 20 cents per square foot; when manufactured from tempered steel wire, 40 cents per square foot.

Carriages, and parts of, not specially enumerated or provided for, 30 per cent. ad valorem.

Dolls and toys, 30 per cent. ad valorem.

Fans of all kinds, except palm-leaf fans, of whatever material composed, 30 per cent. ad valorem.

Feathers of all kinds, when dressed, colored, or manufactured, including dressed and finished birds and artificial and ornamental feathers and flowers, or parts thereof, of whatever material composed, not specially enumerated or provided for, 35 per cent. ad valorem.

Friction and lucifer matches of all descriptions, 25 per cent. ad valorem.

Gloves of all descriptions, wholly or partially manufactured, 40 per cent. ad valorem: *Provided*, That gloves made of silk taffeta shall be taxed 50 per cent. ad valorem.

Gun wads of all descriptions, 25 per cent. ad valorem.

Gutta-percha, manufactured, and all articles of hard rubber not specially enumerated or provided for, 30 per cent. ad valorem.

Hair, human, if clean or drawn, but not manufactured, 20 per cent. ad valorem.

Bracelets, braids, chains, rings, curls, and ringlets composed of hair, or of which hair is the component material of chief value, and all manufactures of human hair, 25 per cent. ad valorem.

Hats, materials for: Braids, plaits, flats, willow sheets and squares, fit only for use in making or ornamenting hats, bonnets, and hoods, composed of straw, chip, grass, palm-leaf, willow, hair, whalebone, or any vegetable material, not specially enumerated or provided for, 20 per cent. ad valorem.

Hat-bodies of cotton, 30 per cent. ad valorem.

Hatters' plush, composed of silk or of silk and cotton, 15 per cent. ad valorem.

Inks of all kinds, and ink-powders, 20 per cent. ad valorem.

Japanned ware of all kinds not specially enumerated or provided for, 30 per cent. ad valorem.

Kaolin, crude, \$1 per ton.

China clay or wrought kaolin, \$2 per ton.

Marble of all kinds, in block, rough, or squared, 40 cents per cubic foot.

Marble, sawed, dressed, or otherwise, including marble slabs and marble paving-tiles, 85 cents per cubic foot.

All manufactures of marble not specially enumerated or provided for, 30 per cent. ad valorem.

Papier-maché, manufactures, articles, and wares of, 25 per cent. ad valorem.

Percussion caps, 30 per cent. ad valorem.

Philosophical apparatus and instruments, 25 per cent. ad valorem.

Umbrella and parasol ribs, and stretcher frames, tips, runners, handles, or other parts thereof, when made in whole or chief part of iron, steel, or any other metal, 30 per cent. ad valorem; umbrellas, parasols, and shades, when covered with silk or alpaca, 50 per cent. ad valorem; all other umbrellas, 30 per cent. ad valorem.

Watches, watch-cases, watch-movements, parts of watches, watch-glasses, and watch-keys, whether separately packed or otherwise, and watch materials not specially enumerated or provided for in this act, 25 per cent. ad valorem.

Webbing, composed of cotton, flax, or a mixture of

these materials, not specially enumerated or provided for in this act, 30 per cent. ad valorem.

Sec. 5. That the following amendments to and provisions for existing laws shall take effect on and after the passage and approval of this act:

Section 6 of the act of March 3, 1883, entitled "An act to reduce internal-revenue taxation, and for other purposes," providing a substitute for title 33 of the Revised Statutes of the United States, is hereby amended as to certain of the sections and parts of sections or schedules in such substituted title so that they shall be as follows, respectively:

"Sec. 2,499. Each and every imported article not enumerated or provided for in any schedule in this title, which is similar, either in material, quality, texture, or the use to which it may be applied, to any article enumerated in this title as chargeable with duty, shall pay the same rate of duty which is levied on the enumerated article which it most resembles in any of the particulars before mentioned; and if any non-enumerated article equally resembles two or more enumerated articles on which different rates of duty are chargeable, there shall be levied on such non-enumerated article the same rate of duty as is chargeable on the article which it resembles paying the highest rate of duty; and on articles, not otherwise provided for, manufactured from two or more materials, the duty shall be assessed at the rate at which the dutiable component material of chief value may be chargeable; and the words 'component material of chief value,' whenever used in this title, shall be held to mean that dutiable component material which shall exceed in value any other single component material found in the article; and the value of each component material shall be determined by the ascertained value of such material in its last form and condition before it became a component material of such article. If two or more rates of duty shall be applicable to any imported article, it shall pay duty at the highest of such rates: *Provided*, That any non-enumerated article similar in material and quality and texture and the use to which it may be applied to any article on the free list, and in the manufacture of which no dutiable materials are used, shall be free of duty."

Sec. 2,502. Schedule A—Chemical products.—By striking out from this schedule the words "distilled spirits containing 50 per cent. of anhydrous alcohol, \$1 per gallon"; also, by striking out the words "alcohol containing 94 per cent. anhydrous alcohol, \$2 per gallon."

THE FREE LIST.

Sec. 2,503. By striking out the clause in this section commencing with the words "articles the growth, produce, and manufacture of the United States," and inserting in lieu thereof the following:

"Articles the growth, produce, and manufacture of the United States, when returned after having been exported without having been advanced in value by any process of manufacture or by labor thereon; casks, barrels, carboys, bags, and other vessels of American manufacture exported filled with American products, or exported empty and returned filled with foreign products, including shooks when returned as barrels or boxes; but proof of the identity of such articles shall be made under general regulations to be prescribed by the Secretary of the Treasury; and if any of such articles are subject to internal tax at the time of exportation, such tax shall be proved to have been paid before exportation, and not refunded: *Provided*, That this clause shall not include any article upon which an allowance of drawback has been made, the reimportation of which is hereby prohibited except upon payment of duties equal to the drawbacks allowed."

The clause relating to "wearing apparel," etc. (tariff, paragraph 815), is hereby amended so that it shall read as follows:

"Wearing apparel, implements, instruments, and tools of trade, occupation, or employment, professional books, and other personal effects (not merchandise)

of persons arriving in the United States, not exceeding in value \$500, and not intended for the use of any other person or persons, nor for sale; but this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment or for sale: *Provided, however*, That the limitation in value above specified shall not apply to wearing apparel and other personal effects which may have been taken from the United States to foreign countries by the persons returning therefrom; and such last-named articles shall, upon production of evidence satisfactory to the collector or officer acting as such that they have been previously exported from the United States by such persons, and have not been advanced in value or improved in condition by any process of manufacture or labor thereon since so exported, be exempt from the payment of duty: *And provided further*, That all articles of foreign production or manufacture which may have been once imported into the United States and subjected to the payment of duty shall, upon reimportation, if not improved in condition, except by repairs, by any means, since their exportation from the United States, be entitled to exemption from duty upon their identity being established, under such rules and regulations as may be prescribed by the Secretary of the Treasury.

"Theatrical scenery and actors' and actresses' wardrobes brought by theatrical managers and professional actors and actresses arriving from abroad for their temporary use in the United States; works of art, drawings, engravings, photographic pictures, and philosophical and scientific apparatus brought by professional artists, lecturers, or scientists arriving from abroad for use by them temporarily for exhibition and in illustration, promotion, and encouragement of art, science, or industry in the United States; and wearing apparel and other personal effects of tourists from abroad visiting the United States shall be admitted to free entry under such regulations as the Secretary of the Treasury may prescribe; and bonds shall be given, whenever required by the Secretary of the Treasury, for the payment to the United States of such duties as may be imposed by law upon any and all such articles as shall not be exported within six months after such importation: *Provided, however*, That the Secretary of the Treasury may, in his discretion, extend such period for a further term of six months in cases where application therefor shall be made.

"Wearing apparel, old and worn, not exceeding \$100 in value, upon production of evidence satisfactory to the collector and naval officer (if any) that the same has been donated and imported in good faith for the relief or aid of indigent or needy persons residing in the United States, and not for sale."

Sec. 6. That section 7 of the act approved March 3, 1883, entitled "An act to reduce internal-revenue taxation, and for other purposes," is hereby amended so that it shall read as follows:

"Whenever imported merchandise is subject to an ad valorem rate of duty, or to a duty based upon or regulated in any manner by the value thereof, the duty shall be assessed upon the actual market value or wholesale price of such merchandise, at the time of exportation to the United States, in the principal markets of the country from whence imported, and in the condition in which such merchandise is there bought and sold for exportation to the United States or consigned to the United States for sale, including the value of all cartons, cases, crates, boxes, sacks, and coverings of any kind, and all other costs, charges, and expenses incident to placing the merchandise in condition packed, ready for shipment to the United States: *Provided*, That if there be used for covering or holding imported merchandise, whether dutiable or free, any material or article, other than the ordinary, usual, and necessary coverings used for covering or holding such merchandise, duty shall be levied and collected thereon at the rate to which such ma-

terial or article would be subject if imported separately": *Provided, further*, That so much of the foregoing as relates to boxes, sacks, or coverings shall not apply to boxes, sacks, or such other boxing or covering as may be the usual and necessary covering for machinery or parts thereof.

Sec. 7. That section 8 of the act of March 3, 1883, entitled "An act to reduce internal-revenue taxation, and for other purposes," amending section 2,841 of the Revised Statutes of the United States, is hereby further amended so that said section of the Revised Statutes shall be as follows:

"Sec. 2841. Whenever merchandise imported into the United States is entered by invoice, one of the following declarations, according to the nature of the case, shall be filed with the collector of the port, at the time of entry, by the owner, importer, consignee, or agent; which declaration so filed shall be duly signed by the owner, importer, consignee, or agent, before the collector, or before a notary public or other officer duly authorized by law to administer oaths and take acknowledgments, who may be designated by the Secretary of the Treasury to receive such declarations and to certify to the identity of the persons making them; and every officer so designated shall file with the collector of the port a copy of his official signature and seal: *Provided*, That if any of the invoices or bills of lading of any merchandise imported in any one vessel, which should otherwise be embraced in said entry, have not been received at the date of the entry, the declaration may state the fact, and thereupon such merchandise of which the invoices or bills of lading are not produced shall not be included in such entry, but may be entered subsequently.

"Declaration of consignee, importer, or agent.

"I, —, do solemnly and truly declare that the invoice and bill of lading now presented by me to the collector of — are the true and only invoice and bill of lading by me received of all the goods, wares, and merchandise imported in the —, whereof — is master, from —, for account of any person whomsoever for whom I am authorized to enter the same; that the said invoice and bill of lading are in the state in which they were actually received by me, and that I do not know nor believe in the existence of any other invoice or bill of lading of the said goods, wares, and merchandise; that the entry now delivered to the collector contains a just and true account of the said goods, wares, and merchandise, according to the said invoice and bill of lading; that nothing has been, on my part, nor to my knowledge on the part of any other person, concealed or suppressed, whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise; that the said invoice and the declaration therein are in all respects true, and were made by the person by whom the same purports to have been made; and that if at any time hereafter I discover any error in the said invoice, or in the account now rendered of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district. And I do further solemnly and truly declare that to the best of my knowledge and belief [insert the name and residence of the owner or owners] is [or are] the owner [or owners] of the goods, wares, and merchandise mentioned in the annexed entry; that the invoice now produced by me exhibits the actual cost [if purchased] or the actual market value or wholesale price [if otherwise obtained], at the time of exportation in the principal markets of the country where procured, of the said goods, wares, and merchandise, including the value of all cartons, cases, crates, boxes, sacks, and covering of any kind, and all other costs, charges, and expenses incident to placing said goods, wares, and merchandise in condition packed ready for shipment to the United States, and no other or different discount, bounty, or drawback, but such as has been actually allowed on the same."

"Declaration of owner in cases where merchandise has been actually purchased.

"I —, do solemnly and truly declare that the entry now delivered by me to the collector of — contains a just and true account of all the goods, wares, and merchandise imported by or consigned to me, in the —, whereof — is master, from —; that the invoice and entry which I now produce contain a just and faithful account of the actual cost of the said goods, wares, and merchandise, including the value of all cartons, cases, crates, boxes, sacks, and coverings of any kind, and all other costs, charges, and expenses incident to placing said goods, wares, and merchandise in condition packed, ready for shipment to the United States, and no other discount, drawback, or bounty but such as has been actually allowed on the same; that I do not know nor believe in the existence of any invoice or bill of lading other than those now produced by me, and that they are in the state in which I actually received them. And I further solemnly and truly declare that I have not in the said entry or invoice concealed or suppressed anything whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise; that the said invoice and the declaration thereon are in all respects true, and were made by the person by whom the same purports to have been made; and that if at any time hereafter I discover any error in the said invoice or in the account now produced of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district."

"Declaration of manufacturer or owner in cases where merchandise has not been actually purchased.

"I, —, do solemnly and truly declare that the entry now delivered by me to the collector of — contains a just and true account of all the goods, wares, and merchandise imported by or consigned to me in the —, whereof — is master, from —; that the said goods, wares, and merchandise were not actually bought by me, or by my agent, in the ordinary mode of bargain and sale, but that nevertheless the invoice which I now produce contains a just and faithful valuation of the same, at their actual market value or wholesale price at the time of exportation, in the principal markets of the country where procured for my account [or for account of myself or partners]; that the said invoice contains also a just and faithful account of all the cost of finishing said goods, wares, and merchandise to their present condition, including the value of all cartons, cases, crates, boxes, sacks, and coverings of any kind, and all other costs and charges incident to placing said goods, wares, and merchandise in condition packed, ready for shipment to the United States, and no other discount, drawback, or bounty but such as has been actually allowed on the said goods, wares, and merchandise; and the said invoice and the declaration thereon are in all respects true, and were made by the person by whom the same purports to have been made; that I do not know nor believe in the existence of any invoice or bill of lading other than those now produced by me, and that they are in the state in which I actually received them. And I do further solemnly and truly declare that I have not in the said entry or invoice concealed or suppressed anything whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise; and that if at any time hereafter I discover any error in the said invoice, or in the account now produced of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district."

Sec. 8. That any person who shall knowingly make any false or untrue statement in the declarations provided for in the preceding section, or shall aid or procure the making of any such false statement as to

any matter material thereto, shall, on conviction thereof, be punished by a fine of not exceeding \$5,000, or by imprisonment at hard labor not more than three years, or both, within the discretion of the court: *Provided*, That nothing in this section shall be construed to relieve imported merchandise from forfeiture for any cause elsewhere provided by law.

Sec. 9. That sections 2970 and 2983 of the Revised Statutes of the United States are hereby amended so that the same shall be, respectively, as follows:

"Sec. 2970. Any merchandise deposited in bond in any public or private bonded warehouse may be withdrawn for consumption within three years from the date of original importation, on payment of the duties and charges to which it may be subject by law at the time of such withdrawal: *Provided*, That nothing herein shall affect or impair existing provisions of law in regard to the disposal of perishable or explosive articles."

"Sec. 2983. In no case shall there be any abatement of the duties or allowance made for any injury, damage, or deterioration sustained by any merchandise while deposited in any public or private bonded warehouse: *Provided*, That the duty assessed on merchandise withdrawn from any such warehouse shall be assessed on the quantity withdrawn therefrom at the time of such withdrawal; but no greater allowance for leakage or evaporation of wines, liquors, and distilled spirits shall be made than is or may be allowed by law on domestic spirits or wines in bond: *And provided further*, That nothing in this section as amended shall restrict or in any way affect the liability of the proprietors of bonded warehouses on their bonds: *And provided further*, That nothing herein shall restrain or limit the exercise of the authority conferred on the Secretary of the Treasury by section 2984 of the Revised Statutes."

Sec. 10. That sections 2803 and 3058 of the Revised Statutes be amended to read as follows:

"Sec. 2803. Any baggage or personal effects arriving in the United States in transit to any foreign country may be delivered by the parties having it in charge to the collector of the proper district, to be by him retained, without the payment or exaction of any import duty, or to be forwarded by such collector to the collector of the port of departure, and to be delivered to such parties on their departure for their foreign destination, under such rules, regulations, and fees as the Secretary of the Treasury may prescribe."

"Sec. 3058. All merchandise imported into the United States shall, for the purpose of this title, be deemed and held to be the property of the person to whom the merchandise may be consigned; but the holder of any bill of lading consigned to order and properly indorsed shall be deemed the consignee thereof; and in case of the abandonment of any merchandise to the underwriters, the latter may be recognized as the consignee."

Sec. 11. That authority is hereby given to the Secretary of the Treasury, in his discretion to dispense whenever expedient with the triplicate invoices and consular certificates now required by sections 2853, 2854, 2855 of the Revised Statutes of the United States; and triplicate invoices and consular certificates shall in no case be required when the value of the merchandise shipped by any one consignor, in any one vessel, at one and the same time does not exceed \$100; and the Secretary of the Treasury, with the concurrence of the Secretary of State, is hereby authorized to make such general regulations in regard to invoices and consular certificates as in his judgment the public interest may require.

Sec. 12. That all fees exacted and oaths administered by officers of the customs, under or by virtue of existing laws of the United States, upon the entry of imported goods and the passing thereof through the customs, and also upon all entries of domestic goods, wares, and merchandise for exportation, be, and the same are hereby, abolished; and in case of entry of

merchandise for exportation, a declaration, in lieu of an oath, shall be filed, in such form and under such regulations as may be prescribed by the Secretary of the Treasury; and the penalties for false statements in such declaration provided in the fourth section of this act shall be applicable to declarations made under this section: *Provided*, That where such fees, under existing laws, constitute, in whole or in part, the compensation of any officer, such officer shall receive, from and after the passage of this act, a fixed sum for each year equal to the amount which he would have been entitled to receive as fees for such services.

Sec. 13. That section 2900 of the Revised Statutes be, and hereby is, amended so as to read as follows:

"Sec. 2900. The owner, consignee, or agent of any imported merchandise which has been actually purchased may at the time, and not afterward, when he shall make and verify his written entry of his merchandise, make such addition in the entry to the cost or value given in the invoice, or *pro forma* invoice, or statement in form of an invoice, which he shall produce with his entry, as in his opinion may raise the same to the actual market value or wholesale price of such merchandise, at the period of exportation to the United States, in the principal markets of the country from which the same has been imported; and the collector within whose district any merchandise, whether the same has been actually purchased or procured otherwise than by purchase, may be imported or entered, shall cause such actual market value or wholesale price thereof to be appraised; and if such appraised value shall exceed by 10 per cent. or more the entered value, then, in addition to the duties imposed by law on the same, there shall be levied and collected a duty of 20 per cent. ad valorem on such appraised value. The duty shall not, however, be assessed upon an amount less than the invoice or entered value, except as elsewhere especially provided in this act."

Sec. 14. That all invoices of imported merchandise shall, at or before the shipment of the merchandise, be produced to the consul, vice-consul or commercial agent of the United States of the consular district from which the merchandise is imported to the United States, and if there be no consul, vice-consul, or commercial agent for said district, then said invoices shall be produced to the consul, vice-consul, or commercial agent of the district nearest thereto, and shall have indorsed thereon, when so produced, a declaration signed by the purchaser, manufacturer, owner, or agent, setting forth that the invoice is in all respects correct and true; that it contains, if the merchandise was obtained by purchase, a true and full statement of the time when, and the place where the same was purchased, and the actual cost thereof and of all charges thereon; and that no discounts, bounties, or drawbacks are contained in the invoice but such as have actually been allowed thereon; and when obtained in any other manner than by purchase, the actual market value or wholesale price thereof at the time of exportation to the United States in the principal markets of the country from whence exported; and that no different invoice of the merchandise mentioned in the invoice so produced, has been or will be furnished to any one. If the merchandise was actually purchased, the declaration shall also contain a statement that the currency in which such invoice is made out is the currency which was actually paid for the merchandise by the purchaser.

Sec. 15. That section 2,981 of the Revised Statutes be, and hereby is, amended so as to read as follows:

"Sec. 2,981. The decision of the collector of customs or officer acting as such at the port of importation and entry, as to the rate and amount of duties to be paid on any merchandise, and the dutiable costs and charges thereon, shall be final and conclusive against all persons interested in such merchandise unless the owner, importer, consignee, or agent of the merchandise, shall, within ten days after and not on any day before the ascertainment and liquidation of the duties

by the proper officers of the customs, as well in cases of merchandise entered in bond as for consumption, give notice in writing to the collector if dissatisfied with the aforesaid decision, setting forth therein, distinctly and specifically, and in respect to each entry, the reasons of his objection thereto, and shall also, within thirty days after the date of such ascertainment and liquidation, appeal therefrom to the Secretary of the Treasury, who, on receiving such appeal, shall forthwith call upon the collector for a report thereon; and the collector shall thereupon, if he adheres to his decision, set forth, specifically and in detail, to the Secretary, the reasons therefor; and the decision of the Secretary on such appeal shall be final and conclusive, and such merchandise, or costs and charges, shall be liable to duty accordingly, unless suit shall be brought, within ninety days after the decision of the Secretary of the Treasury on such appeal, for any duties which shall have been paid before the date of such decision on such merchandise, or costs any charges, or within ninety days after the payment of duties paid after the decision of the Secretary. No suit shall be begun or maintained for the recovery of any duties alleged to have been erroneously or illegally exacted, until the decision of the Secretary of the Treasury shall have been first had on such appeal, unless the decision of the Secretary shall be delayed more than ninety days from the date of such appeal. And when a suit shall be brought by the United States to recover the additional duties found due on any ascertainment and liquidation thereof, and not paid, the defendant or defendants shall not be permitted to set up any plea or matter in defense excepting such as shall have been set forth in a protest and appeal made as herein prescribed."

Sec. 16. That the section of the Revised Statutes numbered 3,012 shall be, and hereby is amended by adding at the end of said section the following words:

"And there shall be attached to the said bill of particulars, when served as aforesaid, a copy of each and every such protest or notice of dissatisfaction, and of every appeal relied upon by the plaintiff or plaintiffs in said suit; and the said bill of particulars shall declare the date of liquidation; and a bill of particulars, having been served as aforesaid, shall not thereafter be amended by the plaintiff, or by the court on the plaintiff's motion, so as to increase the total sum claimed therein as having been exacted in excess."

Sec. 17. That no suit which by this act, or by any law of the United States is permitted to be begun against a collector of customs to recover money alleged to have been illegally exacted by him on imported merchandise, shall hereafter be begun or maintained in any court of any State of the United States, but each and every such suit shall be begun in the circuit court of the United States for the district in which such alleged illegal action shall have been made.

Sec. 18. That section 3,012 of the Revised Statutes shall be, and hereby is, amended so as to read as follows:

"Whenever it shall be shown to the satisfaction of the Secretary of the Treasury (first) that, in any case of unascertained or estimated duties, more money has been paid to or deposited with a collector of customs than the law required to be paid or deposited; and also (second) whenever the Secretary of the Treasury shall have decided, on an appeal to him as herein provided, that more money has been paid to or deposited with a collector of customs than the law required; and also (third) whenever any judgment shall have been recovered and entered, in any court of the United States, against a collector of customs, for duties illegally exacted by him on imported merchandise, and a certificate of probable cause shall have been entered in said suit, in compliance with the provisions and requirements of section 989 of the Revised Statutes, from which judgment the Attorney-General shall certify, in conformity with the act of March 3, 1875 (Chapter CXXXVI), that no appeal or writ of error will be

taken by the United States, and from which judgment the Secretary of the Treasury shall also be satisfied that no such appeal or writ of error ought to be taken; and also (fourth) whenever any suit or suits have been begun against a collector of customs to recover money exacted by him and paid under protest, and an appeal, as required by law, and a bill of particulars has been served therein on the defendant or his attorney, as required by law, and when by the legal effect of any judgment of a court of the United States, satisfactory to the Attorney-General and the Secretary of the Treasury as aforesaid, the said exaction of such duties shall have been declared illegal, and protests, appeals, and bills of particulars have been made according to the law in force at the time of importation, and the proper officers of the customs shall, under the instructions of the Secretary of the Treasury, have re-liquidated the entries covered, by said suit or suits, and bill or bills of particulars, according to the principles and rules of law prescribed by said judgment, and the district attorney appearing of record for the defendant shall certify that such suits have been discontinued, the Secretary of the Treasury shall, in each and all of the before-mentioned cases, always excepting judgments or 'judgment cases' in suits commonly known as 'charges and commission' suits, which last named shall only be paid in pursuance of a specific appropriation therefor, draw his warrant upon the Treasurer in favor of the person or persons entitled to the overpayment, or the sum expressed in said judgment, or the sum thus found due on reliquidation of the entries in discontinued suits, including costs payable by law, directing the Treasurer to refund and pay the same out of any money in the Treasury not otherwise appropriated. The necessary moneys therefor are hereby appropriated, and this appropriation shall be deemed a permanent indefinite appropriation."

Sec. 19. That section 2,927 of the Revised Statutes is hereby amended by the addition of the following words thereto:

"No allowances for damages to goods, wares, and merchandise imported into the United States shall hereafter be made in the estimation and liquidation of duties thereon; but the importer thereof may abandon to the Government all or any portion of goods, wares, and merchandise included in any invoice, and be relieved from the payment of the duties on the portion so abandoned: *Provided*, That the portion so abandoned shall amount to 10 per cent. or over of the total value of the invoice."

Sec. 20. That any person who shall give or offer to give or promise to give, excepting for such duties or fees as have been levied or required according to the forms of law, any money or thing of value, directly or indirectly, to any officer or servant of the customs or of the United States, in connection with or pertaining to the importation, or appraisement, or entry, or examination, or inspection of goods, wares, or merchandise, including herein any baggage, or of the liquidation of the entry thereof, shall, on conviction thereof, be fined not less than \$100 nor more than \$5,000, or be imprisoned at hard labor not more than two years, or both, at the discretion of the court; and evidence of such giving or offering or promising to give satisfactory to the court in which such trial is had, shall be regarded as *prima facie* evidence that such giving or offering or promising was contrary to law, and shall put upon the accused the burden of proving that such act was innocent and not done with an unlawful intention.

Sec. 21. That any officer or servant of the customs or of the United States who shall, excepting for lawful duties or fees, demand, exact, or receive from any person, directly or indirectly, any money or thing of value in connection with or pertaining to the importation, appraisement, entry, examination, or inspection of goods, wares, or merchandise, including herein any baggage or liquidation of the entry thereof, shall, on conviction thereof, be fined not less than \$100 nor

more than \$5,000, or be imprisoned at hard labor not more than two years, or both, at the discretion of the court; and evidence of such demanding, exacting, or receiving satisfactory to the court in which such trial is had, shall be *prima facie* evidence that such demanding, exacting, or receiving was contrary to law, and shall put upon the accused the burden of proving that such act was innocent and not with an unlawful intention.

Sec. 22. That section 2,864 of the Revised Statutes be, and hereby is, amended so as to read as follows:

"Sec. 2,864. That any owner, importer, consignee, agent, or other person who shall, with intent to defraud the revenue, make or attempt to make any entry of imported merchandise by means of any fraudulent or false invoice, affidavit, letter, or paper, or by means of any false statement, written or verbal, or who shall be guilty of any willful act or omission by means whereof the United States shall be deprived of the lawful duties, or any portion thereof, accruing upon the merchandise, or any portion thereof, embraced or referred to in such invoice, affidavit, letter, paper, or statement, or affected by such act or omission, shall for each offense be fined in any sum not exceeding \$5,000 nor less than \$50, or be imprisoned for any time not exceeding two years, or both; and, in addition to such fine, such merchandise, or the value thereof, shall be forfeited, which forfeiture shall only apply to the whole of the merchandise, or the value thereof, in the case or package containing the particular article or articles of merchandise to which such fraud or alleged fraud relates; and anything contained in any act which provides for the forfeiture or confiscation of an entire invoice in consequence of any item or items contained in the same being undervalued be, and the same is hereby, repealed."

Sec. 23. That all imported goods, wares, and merchandise which may be in the public stores or bonded warehouses or on shipboard within the limits of any port of entry, or remaining in the customs offices, on the day and year when this act, or any provision thereof, shall go into effect, except as otherwise provided in this act, shall be subject to no other duty, upon the entry thereof for consumption, than if the same were imported respectively after that day; and all goods, wares, and merchandise remaining in bonded warehouses on the day and year this act, or any provision thereof, shall take effect, and upon which the duties shall have been paid, shall be entitled to a refund of the difference between the amount of duties paid and the amount of duties said goods, wares, and merchandise would be subject to if the same were imported respectively after that date.

Sec. 24. That sections 3,011 and 3,013 of the Revised Statutes be, and hereby are, repealed as to all importations made after the date of this act.

Sec. 25. That on and after the 1st day of October, 1888, all taxes on manufactured chewing-tobacco, smoking-tobacco and snuff, all special taxes upon manufacturers of and dealers in said articles, and all taxes upon wholesale and retail dealers in leaf-tobacco be, and are hereby repealed: *Provided*, That there shall be allowed a drawback or rebate of the full amount of tax on all original and unbroken factory packages of smoking and manufactured tobacco and snuff held by manufacturers, factors, jobbers, or dealers on said 1st day of October, if claim therefore shall be presented to the Commissioner of Internal Revenue prior to the 1st day of January, 1889, and not otherwise. No claim shall be allowed and no drawback shall be paid for an amount less than five dollars, and all sums required to satisfy claims under this act shall be paid out of any money in the Treasury not otherwise appropriated. It shall be the duty of the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, to adopt such rules and regulations, and to prescribe and furnish such blanks and forms as may be necessary to carry this section into effect.

Sec. 26. That on and after the 1st day of October, 1888, manufacturers of cigars shall each pay a special

tax of three dollars annually, and dealers in tobacco shall each pay a special tax of one dollar annually. Every person whose business it is to sell or offer for sale cigars, cheroots, or cigarettes shall, on and after the 1st day of Oct., 1888, be regarded as a dealer in tobacco, and the payment of any other special tax shall not relieve any person who sells cigars, cheroots, or cigarettes from the payment of this tax: *Provided*, That no manufacturer of cigars, cheroots, or cigarettes shall be required to pay a special tax as a dealer in tobacco, as above defined, for selling his own products at the place of manufacture: *Provided*, That the bond required to be given in conformity with the provisions of title 35 of the Revised Statutes of the United States, by every person engaging in the manufacture of cigars in the internal-revenue districts of the United States, shall be in such penal sum as the collector of internal revenue may require, not less than \$100, with an addition of \$10 for each person proposed to be employed by such person in making cigars.

Sec. 27. That the sum of \$20,000, or so much thereof as may be necessary, be, and the same is hereby appropriated, out of any money in the Treasury not otherwise appropriated, for the alteration of dies, plates, and stamps, for furnishing blanks and forms, and for such other expenses as shall be incident to the collection of special taxes at the reduced rates provided in this act.

Sec. 28. That section 3861 of the Revised Statutes of the United States, and all laws and parts of laws which impose restrictions upon the sale of leaf-tobacco, be, and are hereby, repealed.

Sec. 29. That whenever in any statute denouncing any violation of the internal-revenue laws as a felony, crime, or misdemeanor, there is prescribed in such statute a minimum punishment, less than which minimum no fine, penalty, imprisonment, or punishment is authorized to be imposed, every such minimum punishment is hereby abolished; and the court or judge in every such case shall have discretion to impose any fine, penalty, imprisonment, or punishment not exceeding the limit authorized by such statute, whether such fine, penalty, imprisonment, or punishment be less or greater than the said minimum so prescribed.

Sec. 30. That no warrant, in any case under the internal-revenue laws, shall be issued upon an affidavit making charges upon information and belief, unless such affidavit is made by a collector or deputy collector of internal revenue or by a revenue agent; and, with the exception aforesaid, no warrant shall be issued except upon a sworn complaint, setting forth the facts constituting the offense and alleging them to be within the personal knowledge of the affiant. And the United States shall not be liable to pay any fees to marshals, clerks, commissioners, or other officers for any warrant issued or arrest made in prosecutions under the internal-revenue laws, unless there be a conviction or the prosecution has been approved, either before or after such arrest, by the attorney of the United States for the district where the offense is alleged to have been committed, or unless the prosecution was commenced by information or indictment.

Sec. 31. That whenever a warrant shall be issued by a commissioner or other judicial officer having jurisdiction for the arrest of any person charged with a criminal offense, such warrant, accompanied by the affidavit on which the same was issued, shall be returnable before some judicial officer named in section 1,014 of the Revised Statutes residing in the county of arrest, or if there be no such judicial officer in that county, before some such judicial officer residing in another county nearest to the place of arrest; and the judicial officer, before whom the warrant is made returnable as herein provided, shall have exclusive authority to make the preliminary examination of every person arrested as aforesaid, and to discharge him, admit him to bail, or commit him to prison, as the case may require: *Provided*, That this section shall not apply to the Indian Territory.

Sec. 32. That the circuit courts of the United States, and the district courts or judges thereof exercising circuit-court powers, and the district courts of the Territories, are authorized to appoint, in different parts of the several districts in which said courts are held, as many discreet persons to become commissioners of the circuit courts as may be deemed necessary; and said courts, or the judges thereof, shall have authority to remove at pleasure any commissioners heretofore or hereafter appointed in said districts.

Sec. 33. That the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may compromise any civil or criminal case, and may reduce or remit any fine, penalty, forfeiture, or assessment under the internal-revenue laws.

Sec. 34. That section 3,176 of the Revised Statutes be amended so as to read as follows:

"Sec. 3,176. The collector or any deputy collector in any district shall enter into and upon the premises, if it be necessary, of any person therein who has taxable property and who refuses or neglects to render any return or list required, or who renders a false or fraudulent return or list, and make, according to the best information which he can obtain, including that derived from the evidence elicited by the examination of the collector, and on his own view and information, such list or return, according to the form prescribed, of the objects liable to tax owned or possessed or under the care or management of such person, and the Commissioner of Internal Revenue shall assess the tax thereon, including the amount, if any, due for special tax, and a penalty of 25 per cent., and he may add to such tax interest at the rate of 10 per cent. per annum thereon from and after the date when such tax became due and payable. The interest so added to the tax shall be collected at the same time and in the same manner as the tax. And the list or return so made and subscribed by such collector or deputy collector shall be deemed good and sufficient for all legal purposes."

Sec. 35. That nothing in this act shall in any way change or impair the force or effect of any treaty between the United States and any other government, or any laws passed in pursuance of or for the execution of any such treaty, so long as such treaty shall remain in force in respect of the subjects embraced in this act; but whenever any such treaty, so far as the same respects said subjects, shall expire or be otherwise terminated, the provisions of this act shall be in force in all respects in the same manner and to the same extent as if no such treaty had existed at the time of the passage hereof.

Sec. 36. That section 3,255 of the Revised Statutes of the United States be amended by striking out all after said number and substituting therefor the following:

"And the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, may exempt distillers of brandy made exclusively from apples, peaches, grapes, or other fruits from any provision of this title relating to the manufacture of spirits, except as to the tax thereon, when in his judgment it may seem expedient to do so.

"The Secretary of the Treasury may exempt all distilleries which mash less than twenty-five bushels of grain per day from the operations of the provisions of this title relating to the manufacture of spirits, except as to the payment of the tax, which said tax shall then be levied and collected on the capacity of said distilleries; and said distilleries may, at the discretion of said Secretary, then be run and operated without store-keepers or 'store-keepers and gaugers.' And the Commissioner of Internal Revenue, with the approval of said Secretary, may establish special warehouses in which he may authorize to be deposited the product of any number of said distilleries to be designated by him, and in which any distiller operating any such distillery may deposit his product, which, when so deposited, shall be subject to all the laws and regulations as to bonds, tax, removals, and

otherwise as other warehouses. The Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, is hereby authorized and directed to make such rules and regulations as may be necessary to carry out the provisions of this section: *Provided*, That such regulations shall be adopted as will require that all the spirits manufactured shall be subject to the payment of the tax according to law."

Sec. 37. That the provisions of an act entitled "An act relating to the production of fruit brandy, and to punish frauds connected with the same," approved March 3, 1877, be extended and made applicable to brandy distilled from apples or peaches, or from any other fruit the brandy distilled from which is not now required, or hereafter shall not be required, to be deposited in a distillery warehouse: *Provided*, That each of the warehouses established under said act, or which may hereafter be established, shall be in charge either of a store-keeper or a store-keeper and gauger, at the discretion of the Commissioner of Internal Revenue.

Sec. 38. That section 3832 of the Revised Statutes, and the supplement thereto, shall be amended so that said section shall read as follows:

"When a judgment of forfeiture, in any case of seizure, is recovered against any distillery used or fit for use in the production of distilled spirits, because no bond has been given, or against any distillery used or fit for use in the production of spirits, having a registered producing capacity of less than one hundred and fifty gallons a day, every still, doubler, worm, worm-tub, mash-tub, and fermenting-tub therein shall be sold, as in case of other forfeited property, without being mutilated or destroyed. And in case of seizure of a still, doubler, worm, worm-tub, fermenting-tub, mash-tub, or other distilling apparatus of any kind whatsoever, for any offense involving forfeiture of the same, it shall be the duty of the seizing officer to remove the same from the place where seized to a place of safe storage; and said property so seized shall be sold as provided by law, but without being mutilated or destroyed."

Sec. 39. That whenever it shall be made to appear to the United States court or judge having jurisdiction that the health or life of any person imprisoned for any offense, in a county jail or elsewhere, is endangered by close confinement, the said court or judge is hereby authorized to make such order and provision for the comfort and well-being of the person so imprisoned as shall be deemed reasonable and proper.

Sec. 40. That all clauses of section 3244 of the Revised Statutes, and all laws amendatory thereof, and all other laws which impose any special taxes upon manufacturers of stills, retail dealers in liquors, and retail dealers in malt liquors, are hereby repealed.

Sec. 41. That this act is intended and shall be construed as an act supplementary and amendatory to existing laws, and the rates of duty and modification of clauses, provisions, and sections as herein specifically made are intended and shall be construed as a repeal of all clauses, provisions, and sections in conflict herewith, but as to all clauses, provisions, and sections in existing laws not herein specifically changed, modified, or amended the rates of duty now existing shall be and remain in full force and effect. This act shall be in force from and after Oct. 1, 1888, except as herein otherwise provided.

This measure was referred in the Senate to the Finance Committee, and the Republican majority of that committee prepared a substitute which they reported by way of amendment October 3. The matter was taken up October 8, and Mr. Allison, of Iowa, made the opening speech in explanation of the Senate bill; but it was not very earnestly discussed, and no attempt was made to push it to a vote before adjournment. The Senate measure

aimed at a reduction of reducing the revenue to the extent of from \$65,000,000 to \$78,000,000; it dealt with all the schedules of the tariff and was avowedly a revision of the customs duties with the purpose of maintaining their protective features though it is not in all respects consistent with that purpose. The heaviest reduction was on internal-revenue taxation, tobacco being made free and the tax on alcohol used in the arts being reduced. The great reduction proposed in the customs duties was the cutting down of the tariff on sugar about one half. Some articles were put on the free list, reducing the estimated revenue still further; but in nearly all the schedules the proposed changes might be expected to increase rather than diminish duties collected. To put the distinction broadly, the Senate bill increased the internal-revenue reduction provided for in the Mills Bill and made the tariff reduction mainly in the duties on sugar and molasses which the Mills Bill had touched but lightly.

The Fisheries Treaty.—Another important matter dealt with was the fisheries treaty sent to the Senate by the President, Feb. 20, 1888. It was negotiated by Thomas F. Bayard, Secretary of State, William L. Putnam, of Maine, and James B. Angell, of Michigan, on the part of the United States, and Joseph Chamberlain, L. S. Sackville West, and Charles Tupper on the part of Great Britain, and was designed to settle "the interpretation of the convention of Oct. 20, 1818," concerning which much controversy had arisen with the Canadian authorities after the termination, June 30, 1885, of the fisheries articles of the treaty of 1871. The proposed treaty was signed at Washington, February 15, and the President in his message transmitting the document to the Senate for consideration, said: "I am given to understand that the other governments concerned in this treaty will, within a few days, in accordance with their methods of conducting public business, submit said treaty to their respective legislatures, when it will be at once published to the world. In view of such action it appears to be advisable that, by publication here, early and full knowledge of all that has been done in the premises should be afforded to our people. It would also seem to be useful to inform the popular mind concerning the history of the long-continued disputes growing out of the subject embraced in the treaty and to satisfy the public interest touching the same, as well as to acquaint our people with the present status of the questions involved, and to give them the exact terms of the proposed adjustment, in place of the exaggerated and imaginative statements which will otherwise reach them. I therefore beg leave respectfully to suggest that said treaty and all such correspondence, messages, and documents relating to the same as may be deemed important to accomplish these purposes be at once made public by the order of your honorable body." This was considered

a sort of challenge to the Senate, and it was promptly accepted by that body. The treaty, contrary to the usual custom, was at once published, and after May 28 it was debated in open session. It is as follows:

Whereas differences have arisen concerning the interpretation of Article I of the Convention of Oct. 20, 1818, the United States of America and Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, being mutually desirous of removing all causes of misunderstanding in relation thereto and of promoting friendly intercourse and good neighborhood between the United States and the possessions of Her Majesty in North America, have resolved to conclude a treaty to that end, and have named as their plenipotentiaries—that is to say:

The President of the United States, Thomas F. Bayard, Secretary of State; William L. Putnam, of Maine; and James B. Angell, of Michigan;

And Her Majesty the Queen of the United Kingdom of Great Britain and Ireland, the Right Hon. Joseph Chamberlain, M. P.; the Hon. Sir Lionel Sackville Sackville West, K. C. M. G. Her Britannic Majesty's Envoy Extraordinary and Minister Plenipotentiary to the United States of America; and Sir Charles Tupper, G. C. M. G., C. B., Minister of Finance of the Dominion of Canada:

Who, having communicated to each other their respective full powers, found in good and due form, have agreed upon the following articles:

ARTICLE I. The high contracting parties agree to appoint a mixed commission to delimit, in the manner provided in this treaty, the British waters, bays, creeks, and harbor of the coast of Canada and of Newfoundland, as to which the United States, by Article I of the convention of Oct. 20, 1818, between the United States and Great Britain, renounced forever any liberty to take, dry, or cure fish.

ART. II. The commission shall consist of two commissioners to be named by Her Britannic Majesty and of two commissioners to be named by the President of the United States, without delay, after the exchange of ratifications of this treaty.

The commission shall meet and complete the delimitation as soon as possible thereafter.

In case of the death, absence, or incapacity of any commissioner, or in the event of any commissioner omitting or ceasing to act as such, the President of the United States or Her Britannic Majesty, respectively, shall forthwith name another person to act as commissioner instead of the commissioner originally named.

ART. III. The delimitation referred to in Article I of this treaty shall be marked upon British admiralty charts by a series of lines regularly numbered and duly described. The charts so marked shall, on the termination of the work of the commission be signed by the commissioners in quadruplicate; one copy whereof shall be delivered to the Secretary of State of the United States and three copies to Her Majesty's Government. The delimitation shall be made in the following manner, and shall be accepted by both the high contracting parties as applicable for all purposes under Article I of the convention of Oct. 20, 1818, between the United States and Great Britain.

The three marine miles mentioned in Article I of the convention of Oct. 20, 1818, shall be measured seaward from low-water mark; but at every bay, creek, or harbor, not otherwise specially provided for in this treaty, such three marine miles shall be measured seaward from a straight line drawn across the bay, creek, or harbor, in the part nearest the entrance at the first point where the width does not exceed ten marine miles.

ART. IV. At or near the following bays the limits of exclusion under Article I of the convention of Oct. 20, 1818, at points more than three marine miles from low-water mark, shall be established by the following lines, namely:

At the Baie des Chaleurs the line from the light at Birch Point, on Miscou Island, to Macquereau Point light; at the Bay of Miramichi, the line from the light at Point E-cuminac to the light on the eastern point of Tabisintac Gulley; at Egmont Bay, in Prince Edward Island, the line from the light at Cape Egmont to the light at West Point; and off St. Ann's Bay, in the province of Nova Scotia, the line from Cape Smoke to the light at Point Aconi.

At Fortune Bay, in Newfoundland, the line from Connaigre Head to the light on the southeasterly end of Brunet Island, thence to Fortune Head; at Sir Charles Hamilton Sound, the line from the southeast point of Cape Fogo to White Island, thence to the north end of Peckford Island, and from the south end of Peckford Island to the east headland of Ragged Harbor.

At or near the following bays the limits of exclusion shall be three marine miles seaward from the following lines, namely:

At or near Barrington Bay, in Nova Scotia, the line from the light on Stoddard Island to the light on the south point of Cape Sable, thence to the light at Bacaro Point; at Chedabucto and St. Peter's Bays, the line from Cranberry Island light to Green Island light, thence to Point Rouge; at Mira Bay, the line from the light on the east point of Scatari Island to the northeasterly point of Cape Morien; and at Placentia Bay, in Newfoundland, the line from Latine Point, on the eastern mainland shore, to the most southerly point of Red Island, thence by the most southerly point of Morasheen Island to the mainland.

Long Island and Bryer Island, at St. Mary's Bay, in Nova Scotia, shall, for the purpose of delimitation, be taken as the coasts of such bay.

ART. V. Nothing in this treaty shall be construed to include within the common waters any such interior portions of any bays, creeks, or harbors as can not be reached from the sea without passing within the three marine miles mentioned in Article I of the convention of Oct. 20, 1818.

ART. VI. The commissioners shall from time to time report to each of the high contracting parties, such lines as they may have agreed upon, numbered, described, and marked as herein provided, with quadruplicate charts thereof; which lines so reported shall forthwith from time to time be simultaneously proclaimed by the high contracting parties, and be binding after two months from such proclamation.

ART. VII. Any disagreement of the commissioners shall forthwith be referred to an umpire selected by the Secretary of State of the United States and Her Britannic Majesty's minister at Washington; and his decision shall be final.

ART. VIII. Each of the high contracting parties shall pay its own commissioners and officers. All other expenses jointly incurred in connection with the performance of the work, including compensation to the umpire, shall be paid by the high contracting parties in equal moieties.

ART. IX. Nothing in this treaty shall interrupt or affect the free navigation of the Strait of Canso by fishing-vessels of the United States.

ART. X. United States fishing-vessels entering the bays or harbors referred to in Article I of this treaty shall conform to harbor regulations common to them and to fishing-vessels of Canada or of Newfoundland.

They need not report, enter, or clear, when putting into such bays or harbors for shelter or repairing damages, nor when putting into the same, outside the limits of established ports of entry, for the purpose of purchasing wood or of obtaining water; except that any such vessel remaining more than twenty-four hours, exclusive of Sundays and legal holidays, within any such port, or communicating with the shore therein, may be required to report, enter, or clear; and no vessel shall be excused heroby from giving due information to boarding officers.

They shall not be liable in any such bays or harbors for compulsory pilotage; nor, when therein for

the purpose of shelter, or of repairing damages, of purchasing wood, or of obtaining water, shall they be liable for harbor dues, tonnage dues, buoy dues, light dues, or other similar dues; but this enumeration shall not permit other charges inconsistent with the enjoyment of the liberties reserved or secured by the convention of Oct. 20, 1818.

ART. XI. United States fishing-vessels entering the ports, bays, and harbors of the eastern or northwestern coasts of Canada or of the coasts of Newfoundland under stress of weather or other casualty may unload, reload, tranship, or sell, subject to customs laws and regulations, all fish on board, when such unloading, transshipment, or sale is made necessary as incidental to repairs, and may replenish outfits, provisions, and supplies damaged or lost by disaster; and in case of death or sickness, shall be allowed all needful facilities, including the shipping of crews.

Licenses to purchase in established ports of entry of the aforesaid coasts of Canada or of Newfoundland, for the homeward voyage, such provisions and supplies as are ordinarily sold to trading-vessels, shall be granted to United States fishing-vessels in such ports, promptly upon application and without charge; and such vessels, having obtained licenses in the manner aforesaid, shall also be accorded upon all occasions such facilities for the purchase of casual or needful provisions and supplies as are ordinarily granted to the trading-vessels: but such provisions or supplies shall not be obtained by barter, nor purchased for resale or traffic.

ART. XII. Fishing-vessels of Canada and Newfoundland shall have on the Atlantic coast of the United States all the privileges reserved and secured by this treaty to United States fishing-vessels in the aforesaid waters of Canada and Newfoundland.

ART. XIII. The Secretary of the Treasury of the United States shall make regulations providing for the conspicuous exhibition by every United States fishing-vessel, of its official number on each bow; and any vessel required by law to have an official number, and failing to comply with such regulations, shall not be entitled to the licenses provided for in this treaty.

Such regulations shall be communicated to Her Majesty's Government previously to their taking effect.

ART. XIV. The penalties for unlawfully fishing in the waters, bays, creeks, and harbors, referred to in Article I of this treaty, may extend to forfeiture of the boat or vessel and appurtenances, and also of the supplies and cargo aboard when the offense was committed; and for preparing in such waters to unlawfully fish therein penalties shall be fixed by the court, not to exceed those for unlawfully fishing; and for any other violation of the laws of Great Britain, Canada, or Newfoundland relating to the right of fishery in such waters, bays, creeks, or harbors, penalties shall be fixed by the court, not exceeding in all \$3 for every ton of the boat or vessel concerned. The boat or vessel may be holden for such penalties and forfeitures.

The proceedings shall be summary and as inexpensive as practicable. The trial (except on appeal) shall be at the place of detention, unless the judge shall, on request of the defense, order it to be held at some other place adjudged by him more convenient. Security for costs shall not be required of the defense, except when bail is offered. Reasonable bail shall be accepted. There shall be proper appeals available to the defense only; and the evidence at the trial may be used on appeal.

Judgments of forfeiture shall be reviewed by the Governor-General of Canada, in council, or the Governor, in council, of Newfoundland, before the same are executed.

ART. XV. Whenever the United States shall remove the duty from fish-oil, whale-oil, seal-oil, and fish of all kinds (except fish preserved in oil), being the produce of fisheries carried on by the fishermen of Canada and Newfoundland, including Labrador, as well as from the usual and necessary casks, barrels,

kegs, cans, and other usual and necessary coverings containing the products above mentioned, the like products, being the produce of fisheries carried on by the fishermen of the United States, as well as the usual and necessary coverings of the same, as above described, shall be admitted free of duty into the Dominion of Canada and Newfoundland.

And upon such removal of duties, and while the aforesaid articles are allowed to be brought into the United States by British subjects, without duty being reimposed thereon, the privilege of entering the ports, bays, and harbors of the aforesaid coasts of Canada and Newfoundland shall be accorded to United States fishing-vessels by annual licenses, free of charge, for the following purposes, namely:

1. The purchase of provisions, bait, ice, seines, lines, and all other supplies and outfits;
 2. Transshipment of catch, for transport by any means of conveyance;
 3. Shipping of crews.
- Supplies shall not be obtained by barter, but bait may be so obtained.

The like privileges shall be continued or given to fishing-vessels of Canada and of Newfoundland on the Atlantic coasts of the United States.

ART. XVI. This treaty shall be ratified by the President of the United States, by and with the advice and consent of the Senate; and by Her Britannic Majesty, having received the assent of the Parliament of Canada and of the Legislature of Newfoundland; and the ratifications shall be exchanged at Washington as soon as possible.

In faith whereof we, the respective plenipotentiaries, have signed this treaty, and have hereunto affixed our seals.

Done in duplicate at Washington this 15th day of February, in the year of our Lord 1883.

PROTOCOL.

The treaty having been signed, the British plenipotentiaries desire to state that they have been considering the position which will be created by the immediate commencement of the fishing season before the treaty can possibly be ratified by the Senate of the United States, by the Parliament of Canada, and the Legislature of Newfoundland.

In the absence of such ratification the old conditions which have given rise to so much friction and irritation might be revived, and might interfere with the unprejudiced consideration of the treaty by the legislative bodies concerned.

Under these circumstances, and with the further object of affording evidence of their anxious desire to promote good feeling and to remove all possible subjects of controversy, the British plenipotentiaries are ready to make the following temporary arrangement for a period not exceeding two years, in order to afford a *modus vivendi* pending the ratification of the treaty.

1. For a period not exceeding two years from the present date, the privilege of entering the bays and harbors of the Atlantic coasts of Canada and Newfoundland shall be granted to United States fishing-vessels by annual licenses at a fee of \$1.50 per ton—for the following purposes:

The purchase of bait, ice, seines, lines, and all other supplies and outfits.

Transshipment of catch and shipping of crews.

2. If, during the continuance of this arrangement, the United States should remove the duties on fish, fish-oil, whale- and seal-oil (and their coverings, packages, etc.), the said licenses shall be issued free of charge.

3. United States fishing-vessels entering the bays and harbors of the Atlantic coasts of Canada or of Newfoundland for any of the four purposes mentioned in Article I of the convention of Oct. 20, 1818, and not remaining therein more than twenty-four hours, shall not be required to enter or clear at the custom-house, providing that they do not communicate with the shore.

4. Forfeiture to be exacted only for the offenses of fishing or preparing to fish in territorial waters.

5. This arrangement to take effect as soon as the necessary measures can be completed by the colonial authorities.

J. CHAMBERLAIN.
L. S. SACKVILLE WEST.
CHARLES TUPPER.

WASHINGTON, Feb. 15, 1883.

PROTOCOL.

The American plenipotentiaries, having received the communication of the British plenipotentiaries of this date conveying their plan for the administration to be observed by the Governments of Canada and Newfoundland in respect of the fisheries during the period which may be requisite for the consideration by the Senate of the treaty this day signed, and the enactment of the legislation by the respective Governments therein proposed, desire to express their satisfaction with this manifestation of an intention on the part of the British plenipotentiaries, by the means referred to, to maintain the relations of good neighborhood between the British possessions in North America and the United States; and they will convey the communication of the British plenipotentiaries to the President of the United States, with a recommendation that the same may be by him made known to the Senate for its information, together with the treaty, when the latter is submitted to that body for ratification.

T. F. BAYARD.
JAMES B. ANGELL.
WILLIAM L. PUTNAM.

WASHINGTON, Feb. 15, 1883.

In his speech in criticism of the treaty, May 29, Mr. Frye, of Maine, said of the delimitation articles: "The first eight articles relate entirely to delimitation. Who asked for delimitation? Who entered complaint that the fishermen in the northeast could not tell where the three-mile shore-line was, or where bays six miles wide at their mouths were? Did this commission ever hear of any complaint? I am aware, sir, that Great Britain, about 1823, in the pursuit of her aggressiveness toward us, declared that these bays were to be measured from headland to headland. But I am equally aware that in less than six months after the claim was made she sent instructions to the colonial officers not to enforce it, and for the whole seventy years it never has been enforced, except in two instances, that of the 'Argus' and the 'Washington.' The 'Washington' was seized in 1843 in the Bay of Fundy fishing outside of the three-mile shore-line. I am equally well aware that subsequently, when we made claim, and on the seizure of the 'Argus,' the two seizures, the whole matter was referred to arbitrators; and that after hearing they determined that neither the 'Argus' nor the 'Washington,' was within British waters. In other words, they determined that the claim made by Great Britain was not sustained by the law or by the treaties, and that this three-mile shore-line and six-mile bay were to control."

Of the ninth and tenth articles, he said: "And the President of the United States congratulates us in his message that at last the Strait of Canoe is free and open. Why, sir, it never was closed in the history of the world, and no nation ever dared to close it, and no

nation ever dreamed of closing it. It lies on this map here. It is the highway between the Gulf of St. Lawrence and the Atlantic Ocean. We have the right secured to us since 1788, ours to-day, around the Magdalen Islands, rights on the easterly shores of the gulf, and certainly we have rights in the broad Atlantic Ocean, and this strait is the open highway connecting our rights in the ocean and our rights in the bay. I say it never was closed, and no one ever dreamed of closing it.

"When a United States fishing-vessel, under the Treaty of 1818, puts into a harbor or bay for shelter she need not report and enter! Is not that an immense privilege to be granted to us? There can not be found in the history of any civilized maritime nation in the whole world an instance where a vessel putting in for shelter was compelled to report and enter. No vessel is compelled to report and enter until she communicates with the shore, until she lands a man or a cargo or goes to the shore to buy or to ship or do something of that kind."

Of the thirteenth article, Mr. Frye said: "We determine by law how our vessels shall be recognized ourselves. We give to one vessel a register, to another an enrollment, to another a license, and it is our privilege to give to the registered vessel a license or an enrollment, and to the licensed vessel a register, and no nation has the right to say to us you can not do this thing. It is a matter for us to determine for ourselves; and yet these commissioners in this treaty have surrendered that right and have declared that our fishing-vessels shall be known by a great mark on the bow which can be seen at a distance, pursued and harassed if you do not give them free fish. It was a shame for our commissioners to do that thing."

To the fourteenth article he also took exception: "Article XIV contains all the legal amenities which have been commended to us. I wish to call the attention of Senators to them and see how they like them. The article provides that where a United States fishing-vessel is fishing within the three-mile shore-limit the only penalty shall be forfeiture of the vessel and her cargo. They shall not hang the captain nor crucify the men. The 'Highland Light,' the only vessel in the last two years taken for violating the law and fishing within the three-mile shore-line, was tried and condemned; and what did she do? She caught enough mackerel within the three-mile shore-line for a breakfast for the crew, and to-day she is a Canadian cruiser. So the first amenity under the treaty is that if one of our fishermen worth about \$10,000, with a cargo worth perhaps \$3,000 more, is caught within these delimited waters—the Bay of Chaleur, Fortune Bay, or any ten-mile bay—catching mackerel enough for the crew's breakfast, the crime shall not be punished by any greater penalty

than the forfeiture of the \$10,000 vessel and the \$3,000 cargo. This is an amenity of the law. No wonder that the President and Secretary Bayard commend it!"

In commenting on the fifteenth article, he said: "Mr. President, we do not acquire commercial privileges by this treaty unless we buy them. Now this is a complete surrender of the position which we have occupied for more than fifty years. We claimed these privileges and these rights. We have insisted upon their enjoyment. We have enjoyed them up to two years ago; and now here is a treaty which admits that Canada's refusal has been right and that we have been wrong; which admits, if we desire to enjoy these privileges, we must buy them of Canada instead of claiming them under the laws of Great Britain and of the United States."

Mr. Gray, of Delaware, said, June 11, in vindication of the treaty: "Now, what has been accomplished by this treaty for the fishermen? In the first place, we have surrendered no doctrine as to jurisdictional waters which it was important to the United States to maintain. So far as area goes we have conceded less of our contention than Great Britain has of hers, and nothing of any value has been conceded by us. For uncertain, vague, and disputed lines of exclusion there is given reasonable, certain, and easily ascertained lines, marked by definite and prominent landmarks. The headland dispute is forever disposed of, and in our favor."

"And, excepting two or three of the bays delineated, all other bays over ten miles wide are conceded, a concession never before made. Compare these practical results with the impossible as well as impolitic course recommended by the majority, of insisting upon a barren recognition of the right to fish in all bays not less than six miles wide, after seventy years of fruitless demand or silent acquiescence."

"What comment is necessary on the statement of the majority report on page 20, that we have given up to the British these great bodies of water, meaning the delimited bays, and that we, by this treaty, 'cede to Great Britain complete dominion over these numerous and for fishing purposes the most valuable of the bays along the coast of British North America'? We never had the right, except perhaps by an intermittent sufferance, to cast a seine or wet a line in any of these waters. The right to exclude us was always maintained, and it is misleading to say, as the majority report does on page 18, that from the time of the seizure of the 'Washington' to the present no case of seizure for fishing in these bays has come to the notice of the committee. Nearly all the time from the case of the 'Washington' down to the present has been covered by the two treaties of reciprocity, and in the intervals uncovered by the permission which those treaties gave to the fishermen of the United States to fish in all British-American waters the cases

of fishermen warned off from these bays were numerous and of constant occurrence.

"Mr. President, the majority report, and likewise the Senator from Maine, are so furious and so illogical in their assaults on this treaty that they even find fault with the ninth article, which declares 'that nothing in this treaty shall interrupt or affect the free navigation of the Strait of Canso by fishing-vessels of the United States.' And yet it is a fact that though this provision was meant among other things to prevent any inference of exclusion from the delimitation of Chedabucto Bay, it does for the first time in our history absolutely dispose of the pretensions of the colonial authorities to control as against our vessels the right of transit through this strait or gut of Canso.

"And now with reference to the privileges in addition to those secured by Article X. Article XI provides for every facility that a fishing-vessel may require in the ports of the Dominion except the purchase of distinctively fishing outfits. Thus commercial rights, so called, are secured to fishing-vessels which practically are the same as are secured to trading-vessels by the arrangement of 1830; and the restriction in the proviso to the first article of the convention of 1818 of the right of entry into bays, harbors, etc., to the four purposes of shelter, repairing damages, purchasing wood, and obtaining water is almost abrogated, as all these additional purposes for which entry may be made into ports are made lawful. Let us examine this important article more closely, because the majority report of the committee distinctly denies its efficiency to produce the results claimed for it by the President. To properly understand what this article means and what we have secured by it, it is necessary to consider just what the claim or contention of Canada was and has always been as to rights of our fishermen under the convention of 1818. The first article of that convention, after the clause in which the United States renounce forever any liberty heretofore enjoyed or claimed by the inhabitants thereof to take, dry, or cure fish on or within three marine miles of any of the coasts, bays, creeks, or harbors of His Britannic Majesty's dominions in America not included within the conceded limits, contains the following proviso, which has been repeated so often, *usque ad nauseam* :

Provided, however, That the American fishermen shall be permitted to enter such bays or harbors for the purpose of shelter and of repairing damages therein, of purchasing wood, and of obtaining water, and for no other purpose whatever. But they shall be under such restrictions as may be necessary to prevent their taking, drying, or curing fish therein, or in any other manner whatever abusing the privileges hereby reserved to them.

"There has always been the claim on the part of the provinces and Great Britain that this language, plainly and literally interpreted, excluded American fishermen from entering

all colonial bays and harbors for any other purpose than the four purposes mentioned in the proviso, and that claim and contention has never been successfully controverted by the United States. This would give them the right to exclude the visits of fishermen to colonial ports for commercial purposes, so they have always contended, though they have not at all times exercised the right claimed. And so true it is that American fishermen have for many years, notably during the time the reciprocity treaties of 1854 and 1871 were in force and during the period of licenses from 1866 to 1870, in all a period of thirty years, as well as imperfectly and intermittently before 1854, enjoyed the privilege of buying bait and supplies and of transshipping their cargoes of fish. But their right to do these things was not admitted to exist under the convention of 1818, nor do I know that it was ever claimed as a right under that convention by the United States. That paragraph provides for and secures to the fishing-vessels of the United States every right of hospitality that they can reasonably demand. I know the Senator from Maine and the Senator from Massachusetts think that rights of hospitality ought not to be the subject of treaty stipulation, but that is not the practice in negotiations between countries, and I submit to the Senate that where the extent to which hospitality has been extended or ought to be extended, has ever come into question or doubt, it is a matter of the greatest importance and of the greatest advantage to those who are affected by it that that extent should be definitely fixed by conventional obligation."

Of the general scope and result of the treaty, Mr. Gray said: "Now, what is the position of Canada under this treaty? Is it a fair and just one for her to assume, and one which it is right and just for us to concede? I declare that it is both, and no fair man, it seems to me, can say otherwise. She has conceded nearly all that we have any right in fairness to ask. We have no right to demand that while we shut her out of our markets, she should give up without reserve every advantage that she possesses by reason of her geographical position and proximity to the great fishing banks off her coasts, and that we shall make her harbors our basis of fishing operations while we refuse to share with her any advantages that we possess. I repeat, she has given us nearly everything we ask and more than we had the right to demand."

August 8, Mr. Evarts, of New York, said of the spirit in which the Canadians have acted: "I understand that the system of worrying was always brought into play whenever we asserted our right in fishing, and they asserted their contravention of it, in order to bring us to a departure from the fishing interests to the trading and commercial interests. There never has been a doubt of it. Whenever this irritation and teasing in the interests of trade induced the governments to try experiments of

reciprocal interchange, then this resort merged the causes of irritation, and any adjudications or determinations were also merged therein for the time. This process, this method of the provinces, is an impetration upon us in the absence of logic. As Hudibras says, it works—

“Not by force of carnal reason,
But indefatigable teasing.”

“And it has been very successful. You can tease a great and powerful and neighboring nation with prosperity open all around it. When we are brought into a critical period of resisting rights, then, under the anomalous condition by which England, in its relation to its provinces, has always undertaken to treat with us, as it were, *per interpositam personam*, it is left for the provinces to make trouble, to make complaints, to make the teasing and the imputations, and then they say to the Canadians, in effect, ‘Well, we can not back you up in these methods, but we will let you run along if you can prevail on your great neighbor to give what you seek,’ and that is, reciprocity and a free market.”

He denied the necessity of a treaty of the kind under consideration: “We are constitutionally in our habits repugnant to treaties. No good comes of encroaching upon our customs laws and duties by entangling treaties—none whatever. Let us govern, let Great Britain govern, let every other nation govern its own interior arrangements of trade. Let it mark its own hospitalities. Let it mark its own duties. Let it mark its own deference to the rights of others. We will do the same for ourselves, too. That is the way to conduct politically these relations of commerce, of hospitality, of deference, of self-respect, of impartial treatment.

“That is the great subject outside of the fishery, but when this prevalent and extending hospitality of trade has reached everything except our fishing-vessels and our fishermen, when it has included and embraced every fishing-vessel and every fisherman of Great Britain in this extension of commercial reciprocity and commercial hospitality, it is said that by virtue of the clauses of the Treaty of 1818 and the Treaty of 1783 we have covenanted forever that fishermen are outside of progressive hospitality, pretending that covenant proscription for this gallant and favored pursuit and all who pursue it can not be ameliorated. They would say that when all others may warm themselves in the hospitality that is wide open to commerce all over these shores, with the United States to everybody else, we have covenanted our fishermen to be outside of that progress, and we must submit to it.

“The covenant was not of proscription, not of exclusion. All commercial relations excluded everything but the fishermen, and they were expressly allowed what was meant to be, and what should have been, insisted upon from the beginning, hospitality to them according

to the whole reach that they needed or desired *qua* fishermen.

“The difficulty was that they were not so much afraid that these fishing-vessels and fishermen would have the means of buying there. There was nothing to sell nor anybody to sell to them for the most part, and there was no local interest to exclude a traffic that would bring money for what they had to sell. The trouble was that the imperial power excluded all importation, and that these fishing-vessels, having this hospitality as extensive as their fishing needs, should not, in the refusal of all other commercial admission, be the means of smuggling and bringing there to sell tobacco or spirits or any of those items that the United Kingdom intended to preserve for revenue purposes.

“Senators will understand what a difference there was between fishing facilities and commercial traffic. All these shores were only occupied and defended for fishing purposes. If they let the fishermen, with any allowance of trade, come in, then where are their custom-houses, where are their revenue officers, where is their possible means by which they can keep us from smuggling and encroaching upon the revenues and breaking over the colonial policy of Great Britain?

“Obedience on our part was rightfully claimed upon this reason and was properly yielded by us. All we wanted was hospitality in our fishing interests. The interdict of trade was universal and inexorable, and there was no ground for an exception in favor of the fishermen. But when the interdict of trade was withdrawn and trade rushed in, when you invite it everywhere and have your custom-houses and your revenue system and want to make revenue out of it, why can not a fishing-vessel, with ‘touch-and-trade’ privileges from its government, trade like the rest? We give this facility on our shores everywhere to foreign fishermen under similar circumstances.

“That is the proper situation of whether or not we should be satisfied with these restrictions, these proscriptions, these oppressions, these harassing and insolent exclusions, under a covenant, it is said, that should inexorably ostracize our fishermen when the ports were opened to everybody else.”

August 21, Mr. Morgan, of Alabama, said of the danger of leaving open the questions settled by the treaty: “So these vain fulminations of this eminent committee who think, as it appears from their utterances, that they have their grasp upon the President of the United States to compel him to do obedience to their will, and who think that by their supplications directed to the British throne they can mitigate and assuage the conduct of Queen Victoria with respect to our fisheries and our fishermen are harmless. These gentlemen can fulminate their idle bulls against the President and against the policy involved in this treaty; they can accept uncertainty and darkness in

the place of light, insecurity in place of the firm rock upon which this treaty would place the rights of the American people, they can create agitation in the land, but, sir, the people of the United States are revolting against these high assumptions on the part of this committee. They are revolting against the idea that the Senate of the United States, that can not declare war of its own motion and by its own resolution, should put this country in a category where war is one of the dismal prospects of the near future in the contemplation of many men who are as firm in their integrity, as bold in their defense of right as any on that side, and who, perhaps, are just as fearless of the results of war as any who have declaimed against this treaty on that side. It does not shame us or alarm us to look the truth in the face, and to be willing to admit and act upon whatever we know to be true.

"The Senate to-day forces the people of the United States into rough and immediate contact with the most dangerous question that can possibly be stated, and that under the depressing influence and shadow of a report which is brought in here by the Committee on Foreign Relations that is intended and well calculated to prevent the British Government from doing anything further in respect of negotiation with us, except merely to find out what we mean by these declarations. I repeat the remark I sometimes have had occasion to make in this debate, that if this were the action of the British Parliament, and if a treaty that we had approved or were willing to approve had been laid before that Parliament by the Queen, and if it had been debated as it has been debated here, and if a committee of the House of Commons had made the same report that we make here in respect of the American people, if they had charged us with outrageous, willful violations of a treaty, if they had declared that the time for negotiation with us in respect of this matter had passed and that this was not a fit subject of negotiation, I can not be so mistaken in American opinion as not to feel entirely warranted in saying before the Senate to-day we would accept that as a challenge to war.

"Now, how they may accept it is not for me to say or even to conjecture, for I know not. I trust in God that the events which seem to lie before us, which will repeat those wrongs of the past as well as cause others of the same nature that are to come, about which we have had so much trouble, may not be of such an aggravated character as to force these two great and magnificent peoples into collision with each other about so small a matter as the duty on salt fish. I trust so.

"Will that side of the chamber pardon me for saying, however, that when you have gone to that extent, and when these calamities occur and these trials are pressing on our country, her interests, her feelings, her sensibilities, shall all be ours, and we will march breast to breast with you with the same alacrity as if

we had never divided in opinion with you on this question or any other, and what the majority shall decree to be the will of the American people in respect to these controversies in the future shall be our will? With one united voice we will go into any contest that may arise, Mr. President, notwithstanding all the sneers and slurs, the contumely and contempt that have been thrown upon the gentlemen on this side of this chamber because of their connection with the late rebellion and their advocacy of this treaty. We shall prove just as true as you are to the flag of the American Union. We will spend our money just as freely as you do and more freely than many of you have done. We have shed our blood where some of you have not dared to shed it in times that have passed, and you will find the old spirit animating the Southern Democracy. You will find that the man who can lead the American hosts to victory in the contests you may bring about and the wars you may provoke will receive from the united Democracy of the country that sort of support and love and affectionate reverence which our fathers bestowed upon Andrew Jackson, and which will cling to his memory in Democratic hearts in the South while time itself shall last, if this shall still be a nation."

August 21, the Senate refused to ratify the proposed treaty by the following vote:

YEAS—Bate, Beck, Berry, Blackburn, Blodgett, Brown, Cockrell, Coke, Colquitt, Daniel, Faulkner, George, Gorman, Gray, Hampton, Harris, Jones of Arkansas, McPherson, Morgan, Pasco, Payne, Pugh, Ransom, Reagan, Vest, Walthall, Wilson of Maryland—27.

NAYS—Aldrich, Allison, Blair, Chace, Chandler, Dawes, Dolph, Edmunds, Evarts, Farwell, Frye, Hale, Hawley, Hiscock, Hoar, Ingalls, Jones of Nevada, Manderson, Mitchell, Platt, Plumb, Quay, Sabin, Sawyer, Sherman, Spooner, Stewart, Stockbridge, Teller, Wilson of Iowa—30.

ABSENT—Bowen, Butler, Call, Cameron, Cullom, Davis, Eustis, Gibson, Hearst, Kenna, Morrill, Paddock, Palmer, Riddleberger, Saulsbury, Stanford, Turpie, Vance, Voorhees—19.

August 23, the President sent to the Senate the following message, asking for fuller power to undertake retaliation in case harsh measures should become necessary in consequence of the rejection of the fisheries treaty:

To the Congress:

The rejection by the Senate of the treaty lately negotiated for the settlement and adjustment of the differences existing between the United States and Great Britain concerning the rights and privileges of American fishermen in the ports and waters of British North America, seems to justify a survey of the condition to which the pending question is thus remitted.

The treaty upon this subject concluded in 1818, through disagreements as to the meaning of its terms, has been a fruitful source of irritation and trouble. Our citizens engaged in fishing enterprises in waters adjacent to Canada have been subjected to numerous vexatious interferences and annoyances; their vessels have been seized upon pretexts which appeared to be entirely inadmissible, and they have been otherwise treated by the Canadian authorities and officials in a manner inexcusably harsh and oppressive.

This conduct has been justified by Great Britain

and Canada by the claim that the Treaty of 1818 permitted it, and upon the ground that it was necessary to the proper protection of Canadian interests. We deny that treaty agreements justify these acts, and we further maintain that, aside from any treaty restraints, of disputed interpretation, the relative positions of the United States and Canada as near neighbors, the growth of our joint commerce, the development and prosperity of both countries, which amicable relations surely guarantee, and, above all, the liberality always extended by the United States to the people of Canada, furnish motives for kindness and consideration higher and better than treaty covenants.

While keenly sensitive to all that was exasperating in the condition, and by no means indisposed to support the just complaints of our injured citizens, I still deemed it my duty for the preservation of the important American interests, which were directly involved, and in view of all the details of the situation, to attempt by negotiation to remedy existing wrongs, and to finally terminate by a fair and just treaty these ever-recurring causes of difficulty.

I fully believe that the treaty just rejected by the Senate was well suited to the exigency, and that its provisions were adequate for our security in the future from vexatious incidents and for the promotion of friendly neighborhood and intimacy, without sacrificing in the least our national pride or dignity.

I am quite conscious that neither my opinion of the value of the rejected treaty nor the motives which prompted its negotiation are of importance in the light of the judgment of the Senate thereupon. But it is of importance to note that this treaty has been rejected without any apparent disposition on the part of the Senate to alter or amend its provisions, and with the evident intention, not wanting expression, that no negotiation should at present be concluded touching the matter at issue.

The co-operation necessary for the adjustment of the long-standing national differences with which we have to deal, by methods of conference and agreement, having thus been declined, I am by no means disposed to abandon the interests and the rights of our people in the premises or to neglect their grievances, and I therefore turn to the contemplation of a plan of retaliation as a mode, which still remains, of treating the situation.

I am not unmindful of the gravity of the responsibility assumed in adopting this line of conduct, nor do I fail in the least to appreciate its serious consequences. It will be impossible to injure our Canadian neighbors by retaliatory measures without inflicting some damage upon our own citizens. This results from our proximity, our community of interests, and the inevitable commingling of the business enterprises which have been developed by mutual activity.

Plainly stated, the policy of national retaliation manifestly embraces the infliction of the greatest harm upon those who have injured us, with the least possible damage to ourselves. There is also an evident propriety, as well as an invitation to moral support, found in visiting upon the offending party the same measure or kind of treatment of which we complain, and, as far as possible, within the same lines. And, above all things, the plan of retaliation if entered upon should be thorough and vigorous.

These considerations lead me at this time to invoke the aid and counsel of the Congress and its support in such a further grant of power as seems to me necessary and desirable to render effective the policy I have indicated.

The Congress has already passed a law, which received Executive assent on the 3d day of March, 1887, providing that in case American fishing-vessels being or visiting in the waters or at any of the ports of the British dominions of North America, should be or lately had been deprived of the rights to which they were entitled by treaty or law, or if they were denied certain other privileges therein specified, or vexed and harassed in the enjoyment of the same, the President

might deny to vessels and their masters and crews of the British dominions of North America any entrance into the waters, ports, or harbors of the United States, and also deny entry into any port or place of the United States of any product of said dominions, or other goods coming from said dominions to the United States.

While I shall not hesitate upon proper occasion to enforce this act, it would seem to be unnecessary to suggest that if such enforcement is limited in such a manner as shall result in the least possible injury to our own people, the effect would probably be entirely inadequate to the accomplishment of the purpose desired.

I deem it my duty, therefore, to call the attention of the Congress to certain particulars in the action of the authorities of the Dominion of Canada, in addition to the general allegations already made, which appear to be in such marked contrast to the liberal and friendly disposition of our country as in my opinion to call for such legislation as will, upon the principles already stated, properly supplement the power to inaugurate retaliation already vested in the Executive.

Actuated by the generous and neighborly spirit which has characterized our legislation, our tariff laws have, since 1866, been so far waved in favor of Canada as to allow free of duty the transit across the territory of the United States of property arriving at our ports and destined to Canada, or exported from Canada to other foreign countries.

When the Treaty of Washington was negotiated in 1871, between the United States and Great Britain, having for its object very largely the modification of the Treaty of 1818, the privileges above referred to were made reciprocal and given in return by Canada to the United States, in the following language, contained in the twenty-ninth article of said treaty:

"It is agreed, that for the term of years mentioned in Article XXXIII of this treaty, goods, wares, or merchandise arriving at the ports of New York, Boston, and Portland, and any other ports in the United States, which have been or may from time to time be specially designated by the President of the United States, and destined for Her Britannic Majesty's possessions in North America, may be entered at the proper custom-house and conveyed in transit, without the payment of duties, through the territory of the United States, under such rules, regulations, and conditions for the protection of the revenue as the Government of the United States may from time to time prescribe; and under like rules, regulations, and conditions, goods, wares, or merchandise may be conveyed in transit without the payment of duties from such possessions through the territory of the United States, for export from the said ports of the United States.

"It is further agreed that, for the like period, goods, wares, or merchandise arriving at any of the ports of Her Britannic Majesty's possessions in North America, and destined for the United States, may be entered at the proper custom-house and conveyed in transit, without the payment of duties, through the said possessions under such rules and regulations and conditions for the protection of the revenue as the government of the said possessions may from time to time prescribe; and under like rules and regulations and conditions, goods, wares, or merchandise may be conveyed in transit, without payment of duties, from the United States through the said possessions to other places in the United States, or for export from ports in the said possessions."

In the year 1866 notice was received by the representatives of our Government that our fishermen would no longer be allowed to ship their fish in bond and free of duty through Canadian territory to this country, and ever since that time such shipment has been denied.

The privilege of such shipment which had been extended to our fishermen was a most important one,

allowing them to spend the time upon the fishing-grounds, which would otherwise be devoted to a voyage home with their catch, and doubling their opportunities for profitably prosecuting their vocation. In forbidding the transit of the catch of our fishermen over their territory in bond and free of duty the Canadian authorities deprived us of the only facility dependent upon their concession, and for which we could supply no substitute.

The value to the Dominion of Canada of the privilege of transit for their exports and imports across our territory and to and from our ports, though great in every aspect, will be better appreciated when it is remembered that for a considerable portion of each year the St. Lawrence river, which constitutes the direct avenue of foreign commerce leading to Canada, is closed by ice.

During the last six years the imports and exports of British Canadian provinces carried across our territory, under the privileges granted by our laws, amounted in value to about \$270,000,000, nearly all of which were goods dutiable under our tariff laws, by far the larger part of this traffic consisting of exchanges of goods between Great Britain and her American provinces brought to and carried from our ports in their own vessels.

The treaty stipulation entered into by our Government was in harmony with laws which were then on our statute-book, and are still in force.

I recommend immediate legislative action conferring upon the Executive the power to suspend by proclamation the operation of all laws and regulations permitting the transit of goods, wares, and merchandise in bond across or over the territory of the United States to or from Canada.

There need be no hesitation in suspending these laws arising from the supposition that their continuation is secured by treaty obligations, for it seems quite plain that Article XXIX of the treaty of 1871, which was the only article incorporating such laws, terminated on the 1st day of July, 1885.

The article itself declares that its provisions shall be in force "for the term of years mentioned in Article XXXIII of this treaty." Turning to Article XXXIII we find no mention of the twenty-ninth article, but only a provision that Articles XVIII to XXV, inclusive, and Article XXX shall take effect as soon as the laws required to carry them into operation shall be passed by the legislative bodies of the different countries concerned, and that "they shall remain in force for the period of ten years from the date at which they may come into operation, and further until the expiration of two years after either of the high contracting parties shall have given notice to the other of its wish to terminate the same."

I am of the opinion that the "term of years mentioned in Article XXXIII" referred to in Article XXIX as the limit of its duration, means the period during which Articles XVIII to XXV, inclusive, and Article XXX, commonly called the "fishery articles," should continue in force under the language of said Article XXXIII.

That the joint high commissioners who negotiated the treaty so understood and intended the phrase is certain, for in a statement containing an account of their negotiations, prepared under their supervision and approved by them, we find the following entry on the subject: "The transit question was discussed, and it was agreed that any settlement that might be made should include a reciprocal arrangement in that respect for the period for which the fishery articles should be in force."

In addition to this very satisfactory evidence supporting this construction of the language of Article XXIX, it will be found that the law passed by Congress to carry the treaty into effect furnishes conclusive proof of the correctness of such construction.

This law was passed March 1, 1873, and is entitled "An act to carry into effect the provisions of the treaty between the United States and Great Britain,

signed in the city of Washington the 8th day of May, 1871, relating to the fisheries." After providing, in its first and second sections, for putting in operation Articles XVIII to XXV, inclusive, and Article XXX of the treaty, the third section is devoted to Article XXIX, as follows: "Sec. 3. That from the date of the President's proclamation authorized by the first section of this act, and so long as the Articles XVIII to XXV, inclusive, and Article XXX of said treaty shall remain in force according to the terms and conditions of Article XXXIII of said treaty, all goods, wares, and merchandise arriving," etc., etc., following in the remainder of the section the precise words of the stipulation on the part of the United States as contained in Article XXIX, which I have already fully quoted.

Here, then, is a distinct enactment of the Congress limiting the duration of this article of the treaty to the time that Articles XVIII to XXV, inclusive, and Article XXX should continue in force. That in fixing such limitations it but gave the meaning of the treaty itself, is indicated by the fact that its purpose is declared to be to carry into effect the provisions of the treaty, and by the further fact that this law appears to have been submitted before the promulgation of the treaty, to certain members of the Joint High Commission, representing both countries, and met with no objections or dissent.

There appearing to be no conflict or inconsistency between the treaty and the act of the Congress last cited, it is not necessary to invoke the well-settled principle that in case of such conflict the statute governs the question.

In any event, and whether the law of 1873 construes the treaty or governs it, section 29 of such treaty, I have no doubt, terminated with the proceedings taken by our Government to terminate Articles XVIII to XXV, inclusive, and Article XXX of the treaty. These proceedings had their inception in a joint resolution of Congress passed May 8, 1888, declaring that in the judgment of Congress these articles ought to be terminated, and directing the President to give the notice to the Government of Great Britain provided for in Article XXXIII of the treaty. Such notice having been given two years prior to the 1st day of July, 1885, the articles mentioned were absolutely terminated on the last-named day, and with them Article XXIX was also terminated.

If by any language used in the joint resolution it was intended to relieve section 3 of the act of 1873 embodying Article XXIX of the treaty from its own limitations, or to save the article itself, I am entirely satisfied that the intention miscarried.

But statutes granting to the people of Canada the valuable privileges of transit for their goods from our ports and over our soil, which had been passed prior to the making of the treaty of 1871 and independently of it, remained in force; and ever since the abrogation of the treaty, and notwithstanding the refusal of Canada to permit our fishermen to send their fish to their home market through her territory in bond, the people of that Dominion have enjoyed without diminution the advantages of our liberal and generous laws.

Without basing our complaint upon a violation of treaty obligations, it is nevertheless true that such a refusal of transit and the other injurious acts which have been recited constitute a provoking insistence upon rights neither mitigated by the amenities of national intercourse nor modified by the recognition of our liberality and generous considerations. The history of events connected with this subject makes it manifest that the Canadian Government can if so disposed administer its laws and protect the interests of its people without manifestation of unfriendliness and without the unneighborly treatment of our fishing-vessels of which we have justly complained; and whatever is done on our part should be done in the hope that the disposition of the Canadian Government may remove the occasion of a resort to the additional

executive power now sought through legislative action.

I am satisfied that upon the principles which should govern retaliation our intercourse and relations with the Dominion of Canada furnish no better opportunity for its application than is suggested by the conditions herein presented; and that it could not be more effectively inaugurated than under the power of suspension recommended.

While I have expressed my clear conviction upon the question of the continuance of section 29 of the treaty of 1871, I, of course, fully concede the power and the duty of the Congress in contemplating legislative action to construe the terms of any treaty stipulation which might upon any possible consideration of good faith limit such action; and likewise the peculiar propriety in the case here presented of its interpretation of its own language as contained in the laws of 1873, putting in operation said treaty, and of 1883 directing the termination thereof; and if in the deliberate judgment of Congress any restraint to the proposed legislation exists it is to be hoped that the expediency of its early removal will be recognized.

I desire also to call the attention of the Congress to another subject involving such wrongs and unfair treatment to our citizens as, in my opinion, require prompt action.

The navigation of the Great Lakes and the immense business and carrying trade growing out of the same, have been treated broadly and liberally by the United States Government, and made free to all mankind, while Canadian railroads and navigation companies share in our country's transportation upon terms as favorable as are accorded to our own citizens.

The canals and other public works built and maintained by the Government along the line of the lakes are made free to all.

In contrast to this condition, and evincing a narrow and ungenerous commercial spirit, every lock and canal which is a public work of the Dominion of Canada is subject to tolls and charges.

By Article XXVII of the treaty of 1871 provision was made to secure to the citizens of the United States the use of the Welland, St. Lawrence, and other canals in the Dominion of Canada, on terms of equality with the inhabitants of the Dominion, and to also secure to the subjects of Great Britain the use of the St. Clair Flats Canal on terms of equality with the inhabitants of the United States.

The equality with the inhabitants of the Dominion which we were promised in the use of the canals of Canada did not secure to us freedom from tolls in their navigation, but we had a right to expect that we, being Americans and interested in American commerce, would be no more burdened in regard to the same than Canadians engaged in their own trade; and the whole spirit of the concession made was, or should have been, that merchandise and property transported to an American market through these canals should not be enhanced in its cost by tolls many times higher than such as were carried to an adjoining Canadian market. All our citizens, producers and consumers, as well as vessel owners, were to enjoy the equality promised.

And yet evidence has for some time been before the Congress, furnished by the Secretary of the Treasury, showing that while the tolls charged in the first instance are the same to all, such vessels and cargoes as are destined to certain Canadian ports are allowed a refund of nearly the entire tolls, while those bound for American ports are not allowed any such advantage.

To promise equality and then in practice make it conditional upon our vessels doing Canadian business instead of their own is to fulfill a promise with the shadow of performance.

I recommend that such legislative action be taken as will give Canadian vessels navigating our canals, and their cargoes, precisely the advantages granted to

our vessels and cargoes upon Canadian canals, and that the same be measured by exactly the same rule of discrimination.

The course which I have outlined, and the recommendations made, relate to the honor and dignity of our country, and the protection and preservation of the rights and interests of all our people. A government does but half its duty when it protects its citizens at home and permits them to be imposed upon and humiliated by the unfair and overreaching disposition of other nations. If we invite our people to rely upon arrangements made for their benefit abroad, we should see to it that they are not deceived; and if we are generous and liberal to a neighboring country, our people should reap the advantage of it by a return of liberality and generosity.

These are subjects which partisanship should not disturb or confuse. Let us survey the ground calmly and moderately, and, having put aside other means of settlement, if we enter upon the policy of retaliation, let us pursue it firmly, with a determination only to subserve the interests of our people, and maintain the high standard and the becoming pride of American citizenship.

GROVER CLEVELAND.

EXECUTIVE MANSION, Aug. 23, 1888.

After the reading of this message in the House of Representatives, a bill such as the President asked for was introduced; on August 30 it was amended and reported favorably from the committee to which it was referred; and on September 8 it was passed. But the Senate took no action on the measure, the majority holding that the retaliatory law of 1887, which the President had not used, gave him ample power in the premises. Mr. Sherman, of Ohio, submitted a resolution for an investigation of the relations of the United States and Canada, with a view to establishing closer relations, but the subject remained undecided at the close of the session.

Chinese Exclusion.—On March 1, 1888, the Senate passed a resolution asking the President to negotiate a treaty with China, providing that no Chinese laborer shall enter the United States. This treaty was negotiated and transmitted to the Senate, March 17. That body amended it by adding a provision that Chinese laborers formerly in this country but now absent should be excluded, whether holding certificates to that effect or not. The treaty was then approved, and a measure passed to carry it into effect, which was signed September 18. On September 3, after a rumor that the Chinese authorities had refused to ratify the treaty, Mr. Scott, of Pennsylvania, brought forward the following bill in the House of Representatives:

A supplement to an act entitled "An act to execute certain treaty stipulations relating to Chinese," approved the 6th day of May, 1882.

Be it enacted, etc., That from and after the passage of this act, it shall be unlawful for any Chinese laborer who shall at any time heretofore have been or may now or hereafter be a resident within the United States, and who shall have departed or shall depart therefrom, and shall not have returned before the passage of this act, to return to or remain in the United States.

SEC. 2. That no certificates of identity provided for in the fourth or fifth sections of the act to which this is a supplement shall hereafter be issued; and every certificate heretofore issued in pursuance thereof

is hereby declared void and of no effect; and the Chinese laborer claiming admission by virtue thereof shall not be permitted to enter the United States.

Sec. 8. That all the duties prescribed, liabilities, penalties, and forfeitures imposed, and the powers conferred, by the second, tenth, eleventh, and twelfth sections of the act to which this is a supplement are hereby extended and made applicable to the provisions of this act.

Sec. 4. That all such part or parts of the act to which this is a supplement as are inconsistent herewith are hereby repealed.

In explanation of his measure, Mr. Scott said: "I desire to call attention to what this bill proposes to do. Under sections 4 and 5 of the statute of 1882, enacted in conformity with the treaty of 1880, it was provided that a Chinaman then a resident of the United States might, under certain conditions, leave the United States, go to China, and return, but was to do so under a certificate issued by the authority of our Government certifying his identity and that he was a resident of the United States. Under this authority, which our treaty stipulations under the treaty of 1880 did not require us to give, a Chinaman could take his certificate and return to China; and as the truth is a merchantable commodity from a Chinese point of view, those certificates were, in many instances, sold to Chinamen, who had never been in this country, who took them and came to the United States in violation of the law. When a Chinaman reached the port of San Francisco the duty of the collector of the port under the law was to determine his identity; and when the collector by positive evidence knew that the Chinaman offering the certificate was not the person to whom it had been originally issued, the collector at once required such Chinaman to leave the country. But it was just here that the United States courts came in and upon habeas-corpus proceedings declared, in many instances, that the Chinaman offering the certificate was the original owner. By this process, Chinese laborers by the thousands have been permitted to come to the United States fraudulently under certificates which had never been issued to them."

The measure was at once passed without a division, and sent to the Senate. In that body it was discussed at some length and passed September 7, by a vote of 37 to 3, there being 86 Senators absent. Those voting in the negative were Brown, Hoar, and Wilson, of Iowa.

September 10, Mr. Sherman, of Ohio, on a motion to reconsider the passage of the bill, said: "Mr. President, having already early in this debate expressed my strong desire to vote for the exclusion of Chinese laborers from this country, and believing that this bill if it stood alone, without any connection with the treaty with China recently pending in the Senate, would be a wise bill, I yet appeal to Senators on both sides of the chamber, for considerations of national honor which ought always first to be heeded on any question that is presented to us, that they allow the bill to

stand in its present position until we can ascertain whether or not the treaty now pending between the two nations will be ratified. That is my only desire. If this bill is allowed to remain in its present position and it shall turn out that this treaty will not be ratified and that the Chinese Government has taken ground against the ratification of the treaty, then I should be willing to vote and I would vote with pleasure for the passage of this bill; but pending that question I submit as a matter of national honor whether it is right and proper for us to seek to nullify a treaty that is now being considered by a friendly nation, a treaty that has been ratified by this body, to which we have committed ourselves in every possible way—whether it is right at this stage of the proceedings to proceed to nullify and abrogate not only all existing treaties with China, but the treaty at present pending between these two nations? I frankly say that if our position were reversed, and Great Britain were thus to act toward the American people, I would without hesitation vote for a declaration of non-intercourse or war.

"It is a departure from all the usages of civilized nations. It is a departure from all considerations of national honor. No man believes that the House of Representatives would have passed this bill except upon the supposition that the treaty had been rejected by China. It was understood in that House at the time it was passed that the Chinese Government had refused to ratify the treaty, or it would not have passed. I can assume that but for that supposed fact the bill could not have passed the House of Representatives. It came to us here; and but for the general idea that the treaty had been rejected by China the bill would surely have been referred to the Committee on Foreign Relations and taken the ordinary course prescribed by our rules for the consideration of public measures. There is no doubt about that.

"Early in the debate I said that my action and my neglect to make the ordinary motion to refer the bill to the Committee on Foreign Relations was based on the idea that I then assumed to be accurate and correct, that the President of the United States had information that this treaty would not be ratified, and therefore that the Congress of the United States would be at liberty to proceed upon that basis. Proceeding upon that basis I was willing that Congress should by law put an end to this whole system of Chinese immigration.

"But since that time the condition has changed. We are informed officially by the President of the United States that this treaty is still under consideration. We are informed from other sources, of which there can be no question, that the Chinese minister is now on his way to this country for the purpose of either conveying to us intelligence that it has been ratified or that it has not been ratified."

The motion to reconsider was lost by a vote of 20 to 21, September 17, and a resolution to withhold the measure from the House was offered by Mr. Edmunds, of Vermont, but not until it had passed beyond control of the Senate and into the hands of the House Committee on Foreign Relations. The committee delayed sending the bill to the President until news came that the Chinese Government had refused to ratify the treaty, and the President signed the measure October 1.

To the Congress:

I have this day approved House bill No. 11,336, supplementary to an act entitled "An act to execute certain treaty stipulations relating to Chinese," approved the 6th day of May, 1882.

It seems to me that some suggestions and recommendations may properly accompany my approval of this bill.

Its object is to more effectually accomplish by legislation the exclusion from this country of Chinese laborers.

The experiment of blending the social habits and mutual race idiosyncrasies of the Chinese laboring-classes with those of the great body of the people of the United States has been proved by the experience of twenty years, and ever since the Burlingame treaty of 1868, to be in every sense unwise, impolitic, and injurious to both nations. With the lapse of time the necessity for its abandonment has grown in force, until those having in charge the government of the respective countries have resolved to modify and sufficiently abrogate all those features of prior conventional arrangements which permitted the coming of Chinese laborers to the United States.

In modification of prior conventions, the treaty of November 17, 1880, was concluded, whereby, in the first article thereof, it was agreed that the United States should at will regulate, limit, or suspend the coming of Chinese laborers to the United States, but not absolutely prohibit it; and under this article an act of Congress, approved May 6, 1882 (see volume 22, page 58, Statutes at Large), and amended July 5, 1884 (volume 23, page 116, Statutes at Large), suspended for ten years the coming of Chinese laborers to the United States, and regulated the going and coming of such Chinese laborers as were at that time in the United States.

It was, however, soon made evident that the mercenary greed of the parties who were trading in the labor of this class of the Chinese population was proving too strong for the just execution of the law, and that the virtual defeat of the object and intent of both law and treaty was being fraudulently accomplished by false pretense and perjury, contrary to the expressed will of both governments.

To such an extent has the successful violation of the treaty and the laws enacted for its execution progressed, that the courts in the Pacific States have been for some time past overwhelmed by the examination of cases of Chinese laborers who are charged with having entered our ports under fraudulent certificates of return or seek to establish by perjury the claim of prior residence.

Such demonstration of the inoperative and inefficient condition of the treaty and law has produced deep-seated and increasing discontent among the people of the United States, and especially with those resident on the Pacific coast. This has induced me to omit no effort to find an effectual remedy for the evils complained of and to answer the earnest popular demand for the absolute exclusion of Chinese laborers having objects and purposes unlike our own and wholly disconnected with American citizenship.

Aided by the presence in this country of able and intelligent diplomatic and consular officers of the Chinese Government and the representations made

from time to time by our minister in China under the instructions of the Department of State, the actual condition of public sentiment and the status of affairs in the United States has been fully made known to the Government of China.

The necessity for remedy has been fully appreciated by that Government, and in August, 1886, our minister at Peking received from the Chinese Foreign Office a communication announcing that China, of her own accord, proposed to establish a system of strict and absolute prohibition of her laborers, under heavy penalties, from coming to the United States, and likewise to prohibit the return to the United States of any Chinese laborer who had at any time gone back to China "in order" (in the words of the communication) "that the Chinese laborers may gradually be reduced in number and causes of danger averted and lives preserved."

This view of the Chinese Government, so completely in harmony with that of the United States, was by my direction speedily formulated in a treaty draught between the two nations, embodying the propositions so presented by the Chinese Foreign Office.

The deliberations, frequent oral discussions, and correspondence on the general questions that ensued, have been fully communicated by me to the Senate at the present session, and, as contained in Senate Executive Document O, parts 1 and 2, and in Senate Executive Document No. 272, may be properly referred to as containing a complete history of the transaction.

It is thus easy to learn how the joint desires and unequivocal mutual understanding of the two governments were brought into articulated form in the treaty, which, after a mutual exhibition of plenary powers from the respective governments, was signed and concluded by the plenipotentiaries of the United States and China at this capital on March 12 last.

Being submitted for the advice and consent of the Senate, its confirmation, on the 7th day of May last, was accompanied by two amendments, which that body ingrafted upon it.

On the 12th day of the same month the Chinese minister, who was the plenipotentiary of his Government in the negotiation and the conclusion of the treaty, in a note to the Secretary of State, gave his approval to these amendments, "as they did not alter the terms of the treaty," and the amendments were at once telegraphed to China, whither the original treaty had previously been sent immediately after its signature on March 12.

On the 13th day of last month I approved Senate bill No. 3304 "to prohibit the coming of Chinese laborers to the United States." This bill was intended to supplement the treaty, and was approved in the confident anticipation of an early exchange of ratifications of the treaty and its amendments and the proclamation of the same, upon which event the legislation so approved was by its terms to take effect.

No information of any definite action upon the treaty by the Chinese Government was received until the 21st ultimo—the day the bill which I have just approved was presented to me—when a telegram from our minister at Peking to the Secretary of State announced the refusal of the Chinese Government to exchange ratifications of the treaty unless further discussion should be had with a view to shorten the period stipulated in the treaty for the exclusion of Chinese laborers, and to change the conditions agreed on, which should entitle any Chinese laborer who might go back to China to return again to the United States.

By a note from the *chargé-d'affaires ad interim* of China to the Secretary of State, received on the evening of the 25th ultimo (a copy of which is herewith transmitted, together with the reply thereto), a third amendment is proposed, whereby the certificate, under which any departing Chinese laborer alleging the possession of property in the United States would

be enabled to return to this country, should be granted by the Chinese consul instead of the United States collector, as had been provided in the treaty.

The obvious and necessary effect of this last proposition would be practically to place the execution of the treaty beyond the control of the United States.

Article I of the treaty proposed to be so materially altered, had, in the course of the negotiations, been settled in acquiescence with the request of the Chinese plenipotentiary, and to his expressed satisfaction.

In 1886, as appears in the documents heretofore referred to, the Chinese Foreign Office had formally proposed to our minister strict exclusion of Chinese laborers from the United States without limitation; and had otherwise and more definitely stated that no term whatever for exclusion was necessary, for the reason that China would of itself take steps to prevent its laborers from coming to the United States.

In the course of negotiations that followed, suggestions from the same quarter led to the insertion in behalf of the United States of a term of "thirty years," and this term, upon the representations of the Chinese plenipotentiary, was reduced to "twenty years," and finally so agreed upon.

Article II was wholly of Chinese origination, and to that alone owes its presence in the treaty.

And it is here pertinent to remark that everywhere in the United States laws for the collection of debts are equally available to all creditors without respect to race, sex, nationality, or place of residence, and equally with the citizens or subjects of the most favored nations and with the citizens of the United States recovery can be had in any court of justice in the United States by a subject of China, whether of the laboring or any other class.

No disability accrues from non-residence of a plaintiff, whose claim can be enforced in the usual way by him or his assignee or attorney in our courts of justice.

In this respect it can not be alleged that there exists the slightest discrimination against Chinese subjects, and it is a notable fact that large trading-firms and companies and individual merchants and traders of that nation are profitably established at numerous points throughout the Union, in whose hands every claim transmitted by an absent Chinaman of a just and lawful nature could be completely enforced.

The admitted and paramount right and duty of every government to exclude from its borders all elements of foreign population which for any reason retard its prosperity or are detrimental to the moral and physical health of its people, must be regarded as a recognized canon of international law and intercourse. China herself has not dissented from this doctrine, but has, by the expressions to which I have referred, led us confidently to rely upon such action on her part in co-operation with us as would enforce the exclusion of Chinese laborers from our country.

This co-operation has not, however, been accorded us. Thus from the unexpected and disappointing refusal of the Chinese Government to confirm the acts of its authorized agent and to carry into effect an international agreement, the main feature of which was voluntarily presented by that Government for our acceptance, and which had been the subject of long and careful deliberation, an emergency has arisen in which the Government of the United States is called upon to act in self-defense by the exercise of its legislative power. I can not but regard the expressed demand on the part of China for a re-examination and renewed discussion of the topics so completely covered by mutual treaty stipulations as an indefinite postponement and practical abandonment of the objects we have in view, to which the Government of China may justly be considered as pledged.

The facts and circumstances which I have narrated lead me, in the performance of what seems to me to be my official duty, to join the Congress in dealing legislatively with the question of the exclusion of Chinese laborers, in lieu of further attempts to adjust it by international agreement.

But while thus exercising our undoubted right in the interests of our people and for the general welfare of our country, justice and fairness seem to require that some provision should be made by act or joint resolution, under which such Chinese laborers as shall actually have embarked on their return to the United States before the passage of the law this day approved, and are now on their way, may be permitted to land provided they have duly and lawfully obtained and shall present certificates heretofore issued permitting them to return in accordance with the provisions of existing law.

Nor should our recourse to legislative measures of exclusion cause us to retire from the offer we have made to indemnify such Chinese subjects as have suffered damage through violence in the remote and comparatively unsettled portions of our country at the hands of lawless men. Therefore I recommend that, without acknowledging legal liability therefor, but because it was stipulated in the treaty which has failed to take effect, and in a spirit of humanity befitting our nation, there be appropriated the sum of \$276,619.75, payable to the Chinese minister at this capital on behalf of his Government as full indemnity for all losses and injuries sustained by Chinese subjects in the manner and under the circumstances mentioned.

GROVER CLEVELAND.

EXECUTIVE MANSION, Oct. 1, 1888.

The Direct-Tax Bill.—The liveliest episode of the session was the struggle in the House of Representatives over the bill to pay back the direct tax levied by the Government in 1861 and only partially collected. It was passed by the Senate, Jan. 18, 1888, as follows:

Be it enacted, etc., That it shall be the duty of the Secretary of the Treasury to credit to each State and Territory of the United States and the District of Columbia a sum equal to all collections made from said States and Territories and the District of Columbia, or from any of the citizens or inhabitants thereof, or other persons, under the act of Congress, approved Aug. 5, 1861, and the amendatory acts thereto.

SEC. 2. That all moneys still due to the United States on the quota of direct tax apportioned by section 8 of the act of Congress approved Aug. 5, 1861, are hereby remitted and relinquished.

SEC. 3. That there is hereby appropriated, out of any money in the Treasury not otherwise appropriated, such sums as may be necessary to reimburse each State, Territory, and the District of Columbia for all money found due to them under the provisions of this act; and the Treasurer of the United States is hereby directed to pay the same to the governors of the States and Territories and to the commissioners of the District of Columbia: *Provided*, That where the sums, or any part thereof, credited to any State, Territory, or the District of Columbia, have been collected by the United States from the citizens or inhabitants thereof, or any other person, either directly or by sale of property, such sums shall be held in trust by such State, Territory, or the District of Columbia for the benefit of those persons or inhabitants from whom they were collected, or their legal representatives: *And provided further*, That no part of the money collected from individuals and to be held in trust as aforesaid shall be retained by the United States as a set-off against any indebtedness alleged to exist against the State, Territory, or District of Columbia in which such tax was collected: *And provided further*, That no part of the money hereby appropriated shall be paid out by the governor of any State or Territory, or any other person, to any attorney or agent under any contract for services now existing or heretofore made between the representative of any State or Territory and any attorney or agent. All claims under the trust hereby created shall be filed with the governor of such State or Territory and the commissioners of the District of Columbia, re-

spectively, within six years next after the passage of this act, and all claims not so filed shall be forever barred, and the money attributable thereto shall belong to such State, Territory, or the District of Columbia, respectively, as the case may be.

Only ten Senators voted against the measure, and there were men of both parties in favor of it and opposed to it. The most important amendment offered was the following, proposed by Mr. Vance, of North Carolina:

SEN. — That the Secretary of the Treasury be, and he is hereby, authorized and directed to credit and pay to each State a sum equal to the amounts collected therein respectively as a tax or duty on raw cotton, under the provisions of the act approved July 1, 1862, and the supplemental and amendatory acts thereto, which sums, when so credited and paid, shall be accepted and held by the States in trust, first, for such of the producers who paid said tax or duty, or their legal representatives, as may make claim to and prove their identity, and the amount of taxes paid, in two years after the passage of this act, and, second, the remainder, if any, to be held and used only as a permanent free-school fund: *Provided*, That where cotton was produced in one State, and, under permit from the Government of the United States, shipped to another State, and the taxes thereon collected in the latter State, then the amount of all such taxes shall be paid to the State in which the cotton was produced.

SEN. — That there is hereby appropriated, out of any money in the Treasury not otherwise appropriated, such sums as may be necessary to carry out the provisions of this act; *Provided*, That any State accepting the trust hereby created is prohibited from paying any part of the funds received to any person, syndicate, or corporation except the producers who paid the taxes on cotton grown by them or their legal representatives; and in no case shall the payment be made to an assignee of such claim.

This amendment was rejected by the following vote:

YEAS—Bate, Berry, Butler, Call, Coke, Daniel, George, Harris, Jones, of Arkansas, Pugh, Quay, Ransom, Reagan, Vance, Walthall, Wilson of Maryland—16.

NAYS—Aldrich, Allison, Beck, Blair, Blodgett, Brown, Cameron, Chase, Chandler, Cockrell, Cullom, Davis, Dawes, Dolph, Evarts, Farwell, Faulkner, Frye, Gorman, Hale, Hawley, Hiscock, Hoar, Ingalls, McPherson, Manderson, Mitchell, Morgan, Paddock, Palmer, Payne, Platt, Plumb, Sabin, Saulsbury, Sawyer, Sherman, Spooner, Stanford, Stewart, Stockbridge, Teller, Turpie, Vest, Voorhees, Wilson of Iowa—46.

ABSENT—Blackburn, Bowen, Colquitt, Edmunds, Eustis, Gibson, Gray, Hampton, Hearst, Jones of Nevada, Kenna, Morrill, Pasco, Riddleberger—14.

Some of the Senators who opposed the amendment were in favor of refunding the cotton-tax, and their position was explained by Mr. Voorhees, of Indiana, who said: "I appeal to the Senators who think as I do on the subject of the cotton-tax not to encumber the original bill with the amendment which is proposed. That defeats the whole concern. At the proper time and under proper circumstances nobody will go further or consider more favorably the proposition embraced in the amendment than I will.

"The question is not always, Mr. President, what is just, but what is practicable and attainable. Let us take the good we can, which is within our reach, and then grasp after more

hereafter, if a hereafter on that subject should come.

"I look upon the bill as presented here as a practical measure, settling and closing up a difficult subject, one that has embarrassed the Treasury in its accounts, and one which has worked inequality, irregularity, and injustice to many States.

"I desire to say this much because I rank myself one of those who think that the cotton-tax was a measure perhaps of oppression and injustice. I do not intend that my vote against this amendment shall be misunderstood as unfriendly to relief on that point, but I should look upon my vote for that amendment now as a vote against this bill, which I heartily concur in."

The measure was reported to the House of Representatives by the Finance Committee, April 8, with two amendments, one inserting "by set-off or otherwise," in the first section after the word "collections," and the other cutting off the final proviso. The case against the bill was presented by Mr. Oates, of Alabama: "The bill before the committee provides for the refunding or repaying in part to the States and Territories and to the District of Columbia, and in part to the individuals from whom it was collected, the direct tax levied under the act of Aug. 1, 1861. A provision in a general revenue bill passed at that time levied for the exigencies of the war which was then impending twenty million dollars annually and apportioned it among the States, Territories, and the District of Columbia according to their respective populations. There were supplementary acts subsequently passed, but these related only to the States then in insurrection or rebellion.

"This law could not, owing to the existence of actual war, be enforced in the Southern States. These supplemental acts contained much harsher provisions for their enforcement than the original act contained. It is a most singular fact, I will remark in passing, that although this law laid this tax annually, there never was any attempt made to collect it except for the first year, and yet, so far as I have been able to find, that law is yet unrepealed. So uneven was it in its operation and contrary to what the people had been accustomed to, I suppose, was the consideration which caused its non enforcement, notwithstanding it was a constitutional enactment.

"The collections of this tax in the loyal or Northern States and Territories, with, I believe, a single exception, were made through the States and Territories and the District of Columbia. They availed themselves of the provision in the act allowing 15 per cent. to be retained out of the collections by all States and Territories which assumed its payment. I believe Delaware was the only exception. All the others assumed and paid, with the exception named, and the Territories of Utah and New Mexico, the amount of the assess-

ment apportioned to their populations respectively. The Territory of Washington never paid in full, but all others of the Union States and Territories assumed and paid the tax, mark you, not as States and Territories, but they collected it from the people, and for the employment of their machinery in collecting this money from the people they retained 15 per cent. of the collections, which aggregated \$2,250,000. And, gentlemen, it was asserted here yesterday, that this bill carried \$15,000,000 only. If you will examine it you will find that it covers the whole field, including the 15 per cent. deduction, and that it aggregates \$17,500,000.

"In the Southern States it could not at the time be enforced, but as the Union arms conquered that territory collectors of this tax followed and collected by assessment and sale in many cases, and in many others by receiving in money directly from the property owner the amount of assessments against his property. There were many irregularities in some of the conquered districts in the matter of the assessments and collections. A notable instance was that in South Carolina, where the entire town of Beaufort was sold after the notice of sale had been misdescribed so far as the property was concerned, the notice given being of a misleading character, and thus the property was thereby sacrificed and the owners robbed of their homes.

"After the war the process of enforced collection in the Southern States continued. Greater progress was made in some localities, as in Louisiana, South Carolina, and Virginia, than in others; but in none, save the State of Louisiana, were the collections completed and the sum raised which had been assessed to them.

"After the war, in view of the condition of affairs in the South the industries of the people completely revolutionized, everything out of joint, the people broken down in fortune and prostrated—the Congress from time to time passed acts delaying and postponing the collection of this tax in those States; the last of which was passed in 1868 and extended the time to the 1st day of January, 1869, since which for a period of twenty years no effort whatever has been made to collect a dollar of this tax.

"The aggregate of collections is about \$17,500,000, which leaves uncollected \$2,500,000 only in round numbers, or one eighth of the original assessment. And this alone is the pretext upon which the passage of this bill is urged—because only one eighth of that tax remains uncollected and which has been allowed to sleep for twenty years, it is now made the pretext for bringing forth this bill to deplete the Treasury of \$17,500,000 in the interest of those who desire to get rid of the surplus in the Treasury otherwise than by reducing the taxation which now burdens the people and cripples our national prosperity.

Other gigantic schemes of misappropriation are to follow if this be successful."

Mr. Wheeler, of Alabama, criticised the measure as essentially unfair: "The effect of the cotton-tax law would be to pay money back to those from whom it was wrongfully taken. It would be very difficult, if not impossible, to return the money to those by whom the direct tax was actually paid, under the bill now being considered, as most of the \$17,000,000 was paid by the States. Again, those States whose population and wealth have increased since 1861 would be losers, while a State which has not been so fortunate would gain if the direct tax were refunded. In discussing the equity of questions like these we must assume that the \$17,000,000 proposed to be paid must be collected in some way from the people, and we must further assume that States pay taxes, substantially, in proportion to their population and wealth. Proceeding under these assumptions, Maine, for instance (if we except Vermont), has changed less than any State, her population being about 8 per cent. greater than in 1860, while the population of Nebraska has increased about 3,000 per cent. Again, the assessed value of property in Maine has increased about 72 per cent., while in Nebraska the increase in the assessed value of property has been more than 8,500 per cent., now surpassing Maine in both wealth and population. Nebraska's part of the direct tax was \$19,812, while that of Maine was \$420,826. Maine would get twenty dollars for every one received by Nebraska, and yet the amount Nebraska would have to pay to make up the \$17,000,000 would exceed that which would be contributed by Maine."

The argument for this bill was put by Mr. Buchanan, of New Jersey, as follows: "Although this tax was an annual tax, no attempt was made to levy or collect it beyond the first year. Other means of raising money were found, and this tax, so unequal in its operation, paid only by the loyal States, or enforced by seizure and sale in conquered territory, already impoverished by the misfortunes of war, was abandoned. By a report from Ros. A. Fish, assistant register of the Treasury, dated March 22, 1886, the amount levied upon the several States, the per cent. allowed for collection, the amount collected in each instance, and the balance remaining due, as appears by the books of the Treasury up to that date, is shown.

"By this report it will be observed that \$2,640,314.49 remains uncollected from fourteen States and Territories, that \$17,359,685.51 was paid by the States and Territories; and of these twenty-nine, each paid in full. This table is the strongest argument which can be presented, showing the inequalities of this collection. For instance, while Alabama's quota was \$529,313.33, she still owes \$511,028.30; Wisconsin's quota was \$519,688.67; she has paid it all. Tennessee's quota was \$669,496;

she still owes \$277,498.52. Indiana's quota was \$904,875.83. It was paid. Mississippi's quota was \$418,084.67; she still owes \$302,046.21. New Jersey's quota was \$450,184; and every cent of it has been paid. To make things equal, this tax should be collected from all or refunded to all. This uncollected tax has been the subject of much controversy in the past between the Treasury officials and some of the States still in arrears. Some of these States, having claims against the General Government, have, upon their presentation, been met by the officials of the Treasury with their unpaid balance of this tax as a set-off.

"What is the proposed measure? It is, shortly, this: First, that the sum collected from each State by collection, set-off, or otherwise, shall be credited to such State; second, that all moneys still due shall be remitted and relinquished; third, that the sums collected from each State shall be returned to it absolutely where the State paid it as a State, and where it was collected by the Government of individuals in a State, in trust, to repay to such individuals.

"If the collection of this tax is not to be completed—and no one advocates that nor claims that it is needed—no fairer way, in my judgment, of correcting this inequality can be devised than the provision made by the bill before us.

"Bitterly as this measure is being fought, even this falls short of doing exact justice. Many of the States which assumed and paid this tax borrowed the money with which they paid it, and in some instances such States have paid interest on this money so borrowed from them until the present. My own State paid (with the 15 per cent. allowance) \$450,184. She paid that money in 1861, now nearly twenty-seven years ago. She issued bonds for her war debt. Many of those bonds bore 7 per cent. interest. But if we reckon interest on \$450,184 for twenty-five years at 6 per cent. we have the sum of \$675,201 for interest alone, which my State should be repaid to put her upon an equality with Utah, which paid nothing, or with Alabama, which has paid next to nothing.

"Mr. Chairman, there is no 'section' in this measure. There is no politics in it. There is one simple, straightforward proposition to do justice to all, so far as the principal paid is concerned, and I am amazed at the fierce opposition it encounters."

Under the leadership of Mr. Oates, a number of Southern Representatives united in filibustering to prevent the passage of the bill, and they succeeded in preventing the transaction of other business and the adjournment of the House from April 4 to April 12; so that the legislative day, Wednesday, April 4, 1888, lasted 192 hours, though the House took several recesses, and was not therefore continuously in session during that time. The deadlock was finally broken under an agree-

ment made at a caucus of the Democratic Representatives that the measure should be taken up Thursday, Dec. 6, 1888, and put to a final vote Tuesday, December 11, the Northern Democrats who had been urgent for its passage yielding so far to Southern Democrats as to agree to its postponement for the session. On the day set, the house passed the measure.

Postal Matters.—A bill relating to permissible marks in printing and writing upon second, third, and fourth class matter was passed by the House Jan. 18, 1888, and by the Senate January 17, and duly approved by the President. It is as follows:

Be it enacted, etc., That mailable matter of the second class shall contain no writing, print, or sign thereon or therein in addition to the original print, except as herein provided, to wit, the name and address of the person to whom the matter shall be sent; index-figures of subscription book, either printed or written; the printed title of the publication and the place of its publication; the printed or written name and address, without addition of advertisement, of the publisher or sender, or both, and written or printed words or figures, or both, indicating the date on which the subscription to such matter will end; the correction of any typographical error; a mark, except by written or printed words, to designate a word or passage to which it is desired to call attention; the words "sample copy," when the matter is sent as such; the words "marked copy," when the matter contains a marked item or article; and publishers or news-agents may inclose in their publications bills, receipts, and orders for subscription thereto, but the same shall be in such form as to convey no other information than the name, place of publication, subscription price of the publication to which they refer, and the subscription due thereon. Upon matter of the third class, or upon the wrapper or envelope inclosing the same, or the tag or label attached thereto, the sender may write his own name, occupation, and residence or business address, preceded by the word "from," and may make marks other than by written or printed words to call attention to any word or passage in the text, and may correct any typographical errors. There may be placed upon the blank leaves or cover of any book or printed matter of the third class a simple manuscript dedication or inscription not of the nature of a personal correspondence. Upon the wrapper or envelope of third-class matter or the tag or label attached thereto may be printed any matter mailable as third class, but there must be left on the address-side a space sufficient for a legible address and necessary stamps. With a package of fourth-class matter, prepaid at the proper rate for that class, the sender may inclose any mailable third-class matter, and may write upon the wrapper or cover thereof, or tag or label accompanying the same, his name, occupation, residence, or business address, preceded by the word "from," and any marks, numbers, names, or letters for purpose of description, or may print thereon the same, and any printed matter not in the nature of a personal correspondence, but there must be left on the address side or face of the package a space sufficient for a legible address and necessary stamps. In all cases directions for transit, delivery, forwarding, or return shall be deemed part of the address, and the Postmaster-General shall prescribe suitable regulations for carrying this section into effect.

Sec. 2. That matter of the second, third, or fourth class containing any writing or printing in addition to the original matter, other than as authorized in the preceding section, shall not be admitted to the mails, nor delivered, except upon payment of postage for matter of the first class, deducting therefrom any amount which may have been prepaid by stamps affixed, unless by direction of the Postmaster-General

such postage shall be remitted; and any person who shall knowingly conceal or inclose any matter of a higher class in that of a lower class, and deposit or cause the same to be deposited for conveyance by mail, at a less rate than would be charged for both such higher and lower class matter, shall for every such offense be liable to a penalty of \$10.

The House, on Feb. 2, 1888, passed the following measure in regard to books as second-class matter:

A bill to amend section 14 of the act approved March 3, 1879, entitled "An act making appropriations for the service of the Post-Office Department for the fiscal year ending June 30, 1880, and for other purposes," and relating to second-class mail-matter.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the fourteenth section of the act approved March 3, 1879, entitled "An act making appropriations for the service of the Post-Office Department for the fiscal year ending June 30, 1880, and for other purposes," be, and the same is hereby amended by adding to the proviso thereof, and at the end of said section, the following words, namely:

"And that no publications, that are but books or reprints of books, whether they be issued complete or in parts, bound or unbound, or in series, or whether sold by subscription or otherwise, shall be admitted to the mails as second-class matter."

Nothing further was done with this measure; but a bill was passed amending the act excluding offensive matter from the mails, and another amending the act authorizing the Postmaster-General to adjust claims of postmasters for losses by fire, etc. An act was passed also limiting the work of letter-carriers to eight hours a day.

Telegraph Affairs.—On Feb. 9, 1888, the Committee of the House on Post-Offices and Post-roads reported an act supplementary to the act of July 1, 1862, entitled "An act to aid in the construction of a railroad and telegraph line from the Missouri river to the Pacific Ocean, and to secure to the Government the use of the same for postal, military, and other purposes." The evil which this measure was designed to remedy was described as follows in the report of the majority of the committee: "The House of Representatives, by resolution adopted Feb. 26, 1886, empowered the Committee on Post-Offices and Post-roads to ascertain and report whether 'additional legislation is needed to prevent a monopoly of telegraphic facilities; to secure to the Southern, Western, and Pacific States the benefits of competition between the telegraph companies; and to protect the people of the United States against unreasonable charges for telegraphic services; and to carry out the purposes of the inquiry authorized the committee to send for and examine persons, books, and papers, administer oaths to witnesses, and employ a stenographer. Pursuant to the terms of the resolution the committee heard statements and examined witnesses with a view of ascertaining especially the relations of the land-grant railroads and telegraphic lines to the lines of other telegraph companies, to the public, and to the Government. As a result of their investigations the conclusion was reached that the

Pacific railroads had not complied with the requirements of the acts under which they were incorporated, for the reason that, instead of constructing, maintaining, and operating a telegraph line, they had divested themselves of this obligation by contracting with the Western Union Telegraph Company to perform the service."

The two leading sections of the act were as follows:

1. That all railroad and telegraph companies to which the United States has granted any subsidy in lands or bonds or loan of credit for the construction of either railroad or telegraph lines, which, by the acts incorporating them, or by any act amendatory or supplementary thereto, are required to construct, maintain, or operate telegraph lines, and all companies engaged in operating said railroads or telegraph lines shall forthwith and henceforward, by and through their own respective corporate officers and employes, construct, maintain, and operate for railroad, governmental, commercial, and all other purposes, telegraph lines, and exercise by themselves alone all the telegraph franchises conferred upon them and obligations assumed by them under the acts making the grants as aforesaid.

2. That whenever any telegraph company which shall have accepted the provisions of title 65 of the Revised Statutes shall extend its line to any station or office of a telegraph line belonging to any one of said railroad or telegraph companies, referred to in the first section of this act, said telegraph company so extending its line shall have the right and said railroad or telegraph company shall allow the line of said telegraph company so extending its line to connect with the telegraph line of said railroad or telegraph company to which it is extended at the place where their lines may meet, for the prompt and convenient interchange of telegraph business between said companies; and such railroad and telegraph companies, referred to in the first section of this act, shall so operate their respective telegraph lines as to afford equal facilities to all, without discrimination in favor of or against any person, company, or corporation whatever, and shall receive, deliver, and exchange business with connecting telegraph lines on equal terms, and affording equal facilities, and without discrimination for or against any one of such connecting lines; and such exchange of business shall be on terms just and equitable.

The remaining provisions were merely to furnish the necessary machinery for enforcing the requirements of these sections, and to invest the Interstate Commerce Commission with the authority and charge them with the duty of seeing the law carried out. The measure passed the House March 3, and subsequently passed the Senate and received the President's signature.

The Senate passed a bill putting all telegraph lines running from one State to another under the supervision of the Interstate Commerce Commission; but the House failed to act on it before adjournment. In that body the minority of the Committee on Commerce reported in favor of such a measure March 20, but the majority reported in favor of a bill establishing a postal telegraph system, formulating the following conclusions:

1. That the time has arrived when the Government should construct and operate a postal-telegraph system as a branch of its postal service.

2. That the service will undoubtedly be self-supporting.

3. That the Government has the right to build and operate telegraph lines under the jurisdiction of its Post-Office Department.

4. That public opinion will not permit, and good faith and justice do not require, the purchase by the Government of the property and franchises of the Western Union Telegraph Company.

Pensions.—On March 8, 1888, the Senate passed a dependent pension bill, but it failed to get through the House. A measure pensioning prisoners taken by the Confederates during the civil war also failed. An act was passed, however, and approved, providing that pensions hereafter granted to widows of soldiers of the war of the rebellion shall begin at the date of the death of their husbands, not from the date of filing claims. A bill was passed and approved increasing to \$30 a month the pension for total deafness, and likewise an act enabling certain volunteer soldiers denied the \$100 bounty under the act of 1872 to receive the benefit of that act; and also a measure providing for the payment of \$100 a year for each inmate in State and Territorial soldiers' homes. Special pension bills were passed in favor of Mrs. Logan and Mrs. Blair, but the bill in favor of Mrs. Sheridan failed to get through the House of Representatives. In all, 688 private pension bills were passed, of which 569 became laws with the President's signature, and 69 became laws without it.

Miscellaneous.—On May 29, 1888, both Houses passed and the President approved a bill reviving the grade of General of the Army, so that Gen. Sheridan, then in imminent danger of death, might be appointed.

On May 10, 1888, the Senate passed, after discussion for more than three weeks, a bill forfeiting all lands heretofore granted to any State or corporation to aid in the construction of a railroad which lands are opposite to and contiguous with the portion of any such railroad not now completed and in operation. In the House of Representatives the majority of the Committee on Public Lands reported a substitute for the Senate bill, which was debated July 5 and passed July 6. The House bill provided for the forfeiture of lands lying along the sections of subsidized railroads not completed within the time specified in the grant, and the clashing of these two measures prevented decisive action.

On May 9, 1888, the Senate passed an international copyright bill, but the House failed to act on it.

On May 21, 1888, the House of Representatives passed a bill making the Department of Agriculture an Executive department the head of which shall be a Cabinet officer; and September 21, the Senate passed the measure with an amendment cutting out the provision of the House bill transferring the Signal Service from the War Department to that newly created. So the bill fell by the way.

Early in the session the President sent a message to Congress recommending the creation of a national board of arbitration, and

April 18, 1888, the House of Representatives passed a measure carrying out the Executive recommendations; but it was not reached in the Senate.

The Blair educational bill was discussed at length, and passed the Senate Feb. 15, 1888, by a vote of 39 to 29; but it was not brought up in the House.

In his third annual message the President expressed a doubt as to authority to purchase bonds over and above the requirements of the sinking-fund, though the authority had been given in a clause in an appropriation bill, June 30, 1882. On April 5, 1888, the Senate passed a resolution declaring that such purchase of bonds is lawful, and April 16, the House passed a resolution to the same effect.

On March 21, 1888, the House passed a bill to establish a Department of Labor to be under control of a Commissioner of Labor. May 22, the Senate amended and passed the measure; and May 31, both Houses agreed to accept the report of a conference committee. The bill was approved by the President; and it merely reorganized the existing Bureau of Labor Statistics.

On March 19, 1888, the House of Representatives passed a measure authorizing the Secretary of the Treasury to issue silver certificates in denominations of twenty-five, fifteen, and ten cents; but the Senate failed to take up the measure.

On April 19, 1888, the Senate passed a bill admitting South Dakota into the Union; but it failed in the House, and so no action was taken on measures for the admission of other new States. The bill for organizing the Territory of Oklahoma also failed.

The House of Representatives made careful investigations of immigration and of trusts and combinations; but reached no result in legislation on either subject.

A bill was passed authorizing the President to arrange a conference between the nations of Central America, South America, and the West Indies for the establishment of international arbitration and the promotion of commerce.

Measures were adopted appropriating money for a gun-factory and for several new ships of war.

A bill was passed making certain judgments and decrees in Federal courts liens on property throughout the State in which the court is held.

Congress provided for an international conference to secure greater safety for life and property at sea; for twenty-seven new public buildings; for an investigation by the Geological Survey of means of storing water in arid regions; for representation at the expositions in Paris, Brussels, Barcelona, and Melbourne.

Measures not already mentioned that failed to become laws were the bill to quiet the title of settlers on the Des Moines river lands; the bill raising the salary of district judges; the

bill for the repeal of the pre-emption and timber-culture laws, and the amendment of the homestead law; the Pacific Railroad funding bill; the bill for the forfeiture of the Northern Pacific grant; the bill to incorporate the Nicaragua Canal Company; the bill to pay losses of depositors in the Freedmen's Bank; the bill for the erection of coast defenses; the bill for the taking of the next census; the bill for the inspection of meat for export.

CONGRESS OF THE UNITED STATES, CONTESTED ELECTIONS IN THE. In this article are summarized all the principal contested elections that have occurred in Congress since the adoption of the Federal Constitution. It is the usage of the House of Representatives to refer all cases of contested seats to the Committee on Elections. The duty of that committee is to examine and report its opinion upon such matters as shall be referred to it by the House; but such opinion, though clothed with a certain authority, is not conclusive upon the House; it may be overruled, and not unfrequently is. The usage of the committee is, after an examination into the facts of the case, to elaborate a report in which these facts are set forth with accuracy; from this statement of fact to deduce the reasons for supporting the one or the other candidate; and to report its opinion to the House, both at length and in the form of a condensed resolution. It is upon this resolution, and not upon the reasons or arguments of the committee, that the House acts, and whether they have or have not concurred with the committee in their views of each case, will not appear as a matter of record on their journals, which will only show that they have concurred with it in the final result. Yet if the House do not dissent from the conclusion of the committee, they may, in general, be presumed to have sanctioned the process of reasoning by which that conclusion was attained.

The Qualifications of Senators of the United States will be found in the Constitution, Article I, section 3; and of Representatives, in Article I, section 2. The debates on amendments originally proposed to be made to the Constitution, in regard to the power of Congress over the subject of elections of members of Congress, will be found in "Lloyd's Debates," vol. ii, p. 244, *et seq.* The original papers and documents of Congress, or the greater portion of them, from the First to the Sixth Congress, were destroyed by the English with the Capitol in 1814, and among other important papers those relating to contested elections were consumed. "Lloyd's Debates" and the newspapers of the day, however, afford us general information of the transactions recorded in the missing documents. But Congress has frequently ordered or authorized the collection and publication, by the public printer, of proceedings in contested elections, either singly or in groups; and such publications are authoritative and should be consulted by the student.

CONKLING, ROSCOE, an American statesman, born in Albany, N. Y., Oct. 30, 1829; died in New York city, April 18, 1883. His father, Alfred (1789-1874), was a member of Congress from 1821 to 1828, judge of the United States District Court for the Northern District of New York from 1825 to 1852, and minister to Mexico from 1852 to 1853. After receiving an academic education, Roscoe studied law under his father, and in 1846 entered the office of Spencer & Kernan in Utica. In 1850, on the resignation of the District Attorney of Oneida County, he was appointed by the Governor for the remainder of the term. In the same year he was admitted to the bar, and in 1858 elected Mayor of Utica. At the end of his term there was a tie between the two candidates for election, in consequence of which Mr. Conkling continued in the office another term. He was elected to Congress in 1858 as a Republican, and re-elected in 1860. He was again a candidate in 1862, but was defeated by Francis Kernan; but in 1864 he was once more opposed to Mr. Kernan, and was elected. He was returned for Congress a fourth time in 1866, but did not take his seat for that term, having been chosen United States Senator in January, 1867, an office which he held continuously till 1881. His term of service in the two houses, therefore, covered the most critical period in the recent history of this country—the exciting years just before and during the civil war, and the reconstruction period immediately following. His first work in the House was as a member of the Committee on the District of Columbia, of which he afterward became chairman. He was also a member of the Committee of Ways and Means and of the special Reconstruction Committee of Fifteen. His first important speech was in favor of the fourteenth amendment to the national Constitution. He early took an assured position in the House, made many vigorous speeches, and showed the qualifications for leadership that appeared so prominently in his later career. He was an active supporter of the policy of Lincoln's administration in the conduct of the

war, attacked the generalship of McClellan, and opposed Spaulding's legal-tender act. After the war he took an active part in the legislation connected with the reconstruction of the Southern States, was opposed to President Johnson's policy, and helped to pass the Civil Rights Bill over his veto. In the Senate he was a member of the Judiciary Committee from the first, was connected with nearly all the leading committees, and chairman of those on commerce and revision of the laws. During the administration of President Grant, Mr. Conkling had much to do with shaping the policy of the Government toward the Southern States. He was a zealous supporter of the President, and soon became the recognized leader of that section of the party which favored his renomination. In the National Republican Convention of 1876 Mr. Conkling was the candidate favored for the nomination by the majority of the New York delegation, and received ninety-three votes; but, in consequence of the opposition of the minority under the leadership of George William Curtis, the New York ballot was transferred to Mr. Hayes. In the proceedings growing out of the disputed election that followed, Mr. Conkling took a leading part. He was a member of the committee that framed the Electoral-Commission

ROSCOE CONKLING.

bill, and advocated it in an able speech in the Senate, taking the ground that the question of the commission's jurisdiction should be left to that body itself. His absence from the Senate when the vote was taken on the Louisiana decision of the commission, was caused by his absence from the city. In 1880 Senator Conkling strongly advocated the election of Gen. Grant for a third term. About this time the division of the Republican party into two factions, popularly called "Stalwarts" and "Half-breeds," became more marked, and their opposition more pronounced. Mr. Conkling and

Mr. Blaine were recognized as the leaders of the factions. The personal enmity between them is said to have dated from a bitter controversy over a bill introduced into Congress by Mr. Conkling in 1866 providing for the reorganization of the army of the United States and looking to the abolition of the Provost-Marshal Bureau. The Half-breeds triumphed in the nominating convention of 1880, and Mr. Garfield was elected. When he took his seat in March, 1881, Mr. Conkling and his colleague, Thomas C. Platt, claimed the right to control the Federal appointments in their State. When the President appointed William H. Robertson, an opponent of Mr. Conkling, to the collectorship of the port of New York, the latter opposed his confirmation, asserting that he should have been consulted in the matter, in accordance with pledges made to him by the President. Mr. Garfield then withdrew all other nominations to New York offices, leaving that for the collectorship to be acted upon separately. Not being able to defeat the confirmation, Mr. Conkling and Mr. Platt resigned from the Senate and returned home in order to appeal to the people of New York, through the State Legislature, to vindicate them and rebuke the President by their prompt re-election. After a long and exciting contest, the matter was decided against them by the election as Senators of Warner Miller and Elbridge G. Latham. The latter received 61 votes to 28 for Mr. Conkling. Mr. Conkling sent the following letter to his supporters:

The heroic constancy of the Spartan band which so long stood for principle and truth has my deepest gratitude and admiration. Borne down by forbidden and abhorrent forces and agencies which never before had away in the Republican party, the memory of their courage and manhood will long live in the highest honor. The near future will vindicate their wisdom and crown them with approval. Please ask them all for me to receive my most grateful acknowledgments.

ROSCOE CONKLING.

Returning to private life, Mr. Conkling resumed the practice of law, settling in New York city. In 1882 President Arthur sent his name to the Senate for a place on the bench of the United States Supreme Court, in place of Ward Hunt, but Mr. Conkling declined. During his residence in New York he was engaged in many important cases, and the fortune of \$200,000 that he left at his death was accumulated during those six years. In 1885-'86 he was counsel of the State Senate Investigating Committee appointed for the purpose of examining into the alleged fraud and bribery in the grant of the Broadway horse-railroad franchise by the Board of Aldermen in 1884. After the taking of testimony, which lasted about three months, Mr. Conkling and Clarence A. Seward made an argument, which resulted in the repeal of the Broadway Railroad charter. Mr. Conkling appeared for the Central Pacific Railway in several suits, and he wrote an opinion for this road in answer to the charges contained in the report of an investigating

commission. He appeared for the Commercial Telegraph Company in its suit against the New York Stock Exchange and the Gold and Stock Ticker Company; was connected with the suit brought by the Bankers and Merchants' Telegraph Company against the Western Union, and was engaged in the Stewart will contest. In 1885 he spent three months in Europe. In the great storm of March 12, 1888, in New York (known as "the blizzard"), he walked from his Wall Street office to his club, near Twenty-third Street, and from the effects of this exposure, added to those of a cold contracted at a hearing in the Stewart will case, he never recovered, the disease taking the form of an abscess at the base of the brain. Mr. Conkling received the degree of LL. D. from Madison University in 1877. His wife, a sister of Horatio Seymour, and his only child, a daughter, survived him.

CONNECTICUT. State Government.—The following were the State officers during the year: Governor, Phineas C. Lounsbury, Republican; Lieutenant-Governor, James L. Howard; Secretary of State, Leverett M. Hubbard; Treasurer, Alexander Warner; Comptroller, Thomas Clark; Secretary of the State Board of Education, Charles D. Hine; Insurance Commissioner, Orsamus R. Fyler; Railroad Commissioners, George M. Woodruff, W. H. Haywood, William O. Seymour; Chief-Justice of the Supreme Court, John D. Park; Associate Justices, Elisha Carpenter, Dwight W. Pardee, Dwight Loomis, and Sidney B. Beardsley.

FINANCES.—The balance in the State treasury on July 1, 1886, was \$230,442.48. During the biennial period since that date the total receipts, including \$1,084,808.08 from a sale of new State bonds authorized by the Refunding act of 1887 were \$4,958,978.06, and the expenditures, including \$1,080,000 paid for bonds redeemed, \$4,437,716.51, leaving a balance on June 30, 1888, of \$751,699.03. Some of the items of expenditure are given in the following table:

ITEMS.	Ending June 30, 1887.	Ending June 30, 1888.
Sessions of the General Assembly	\$110,129 89	\$437 00
Judicial expenses	262,995 23	280,539 90
Board of prisoners in county jails	78,381 15	86,735 81
State Normal School	24,177 41	18,941 38
Common schools	286,828 40	237,224 50
State prison	104,112 68	128,063 66
State Reform School	56,666 24	85,325 48
Humane institutions	140,617 08	143,258 35
Sick and wounded soldiers	60,009 80	43,968 28
National Guard	167,592 95	158,907 00

The largest sources of revenue for 1887 were from State tax collected by the towns, \$698,355.22; from tax on insurance companies, \$280,074.87; from savings-banks, \$211,893.72; from railroads, \$567,571.99; military commutation taxes, \$103,045. For 1888 the receipts were \$487,157.23 from the State tax; \$231,775.63 from insurance companies; \$223,985.70

from savings-banks; \$641,724.79 from railroads; and \$109,055.40 from the military commutation taxes. A reduction of the State tax rate from 2 to 1½ mills caused the decreased revenue from the State tax in the latter year.

The funded debt of the State on the first day of July, 1886, was \$4,271,200. In accordance with the Refunding act of 1887, the 5-per-cent. bonds of 1877, amounting to \$1,080,000, were redeemed during that year and \$1,000,000 of bonds bearing 8½ per cent. interest were issued. The debt, thus reduced by \$80,000 and by \$600 of other bonds redeemed, stood as follows on June 30, 1888:

Issue of 1865, unredeemed	\$600
Issue of March 19, 1882, payable in 1908	500,000
Issue of April 4, 1888, payable in 1908	1,000,000
Issue of March 10, etc., 1885, payable in 1910	1,740,000
Issue of May 18, 1887, payable in 1897	1,000,000
Total	\$4,240,600

Later in 1888 the Treasurer, exercising his power to redeem at any time the issue of 1887, called in \$500,000 of that loan, paying for it out of the large surplus in the treasury.

The telegraph companies in the State refused during the year to pay the full tax assessed on their gross earnings in the State, and there is a controversy as to the constitutionality of the gross-earnings law except when applied to business of the companies done wholly within the State. The companies claim that the tax is a regulation of interstate commerce when imposed upon their revenue derived from messages coming in or going out of the State. The Western Union Company has paid for 1888 a tax of \$715.14. If a tax is due on the total receipts it would amount to \$3,889.48. No legal measures to collect the balance claimed by the State have been taken.

Education.—The amount of the school fund held by the State for the benefit of the common schools, on June 30, was \$2,019,572.40. From the income of this, the sum of \$116,119 was distributed in 1888 for the support of schools. This was about 75 cents for each child, the number of school-children enumerated in 1888 being 154,532. The income distributed in 1887 was \$114,945, and the number of children of school age 153,260. For the school year 1886-'87 the following statistics are compiled: Public-school districts, 1,424; number of public schools, 1,628; number of school-houses, 1,655; average length of school year, in days, 180.18; graded schools, 861; evening schools, 26; estimated value of school property, \$5,789,895.01; number of pupils enrolled, 125,794; number of pupils in private schools, 15,953; number of children in no school, 20,821; average wages of male teachers per month, \$68.82; average wages of female teachers per month, \$38.50. The total amount raised from all sources for support of the public schools in 1886-'87 was \$1,793,869.19, and the expenditures were \$1,768,871.06.

The State Normal School at New Britain is in a flourishing condition, having graduated in

1887 the largest class (62) in its history of thirty-five years. The total attendance at the school for the year was 292, or 26 larger than in any previous year. Additions and improvements in the school-building have recently been made out of a legislative appropriation in 1886.

In September, 1887, the first text-book ever published by the State was issued and distributed to the various schools. This was a small treatise, authorized by the Legislature of 1886, upon physiology and hygiene, especially with reference to the effect of alcoholic liquors on the human system.

Under the child-labor law of 1886, forbidding the employment of children under thirteen years of age in factories, etc., a total of 1,178 children had been discharged by employers up to September, 1887, but no perceptible increase of school attendance resulted therefrom. By an act of 1887, the authorities charged with enforcing the law were also given power to place in school any children found by them unlawfully employed.

Insurance.—Four new life-insurance companies were licensed in 1887 to do business in the State, and two ceased to exist. The six standard Connecticut companies increased their assets during the year by \$2,769,263 and their liabilities, except capital, by \$2,286,160. Four life associations conducted on the assessment plan had insurance of \$63,402,500 in force Dec. 31, 1887, of which \$13,160,250 was written during the year. They paid losses of \$657,593. The single accident company, the Travelers', received \$2,102,258 in premiums and paid \$943,760 for losses. Of the 118 companies engaged in fire insurance, ten stock and sixteen mutual companies are Connecticut corporations. The assets of these stock companies increased from \$26,317,436 in 1886 to \$26,989,632 in 1887, and the liabilities, including capital, scrip, and special funds from \$18,574,874 to \$19,621,898. The Connecticut stock companies now have a surplus of \$18,318,324 as regards policy-holders and the mutual companies, \$1,103,520.

Banks.—The number of savings-banks in the State at the beginning of the year was eighty-five, having assets valued at \$107,896,912, and a surplus of \$3,514,772. The deposits had increased during the year preceding by \$4,765,118.87, making a total amount of \$102,189,984.72. The number of depositors had increased 11,527, showing that the increase of deposits is not due to an accumulation of interest credited to depositors' accounts.

There were also eight State banks with assets of \$4,563,914.74, total surplus, \$512,109.92; and eight trust and loan companies with assets of \$4,430,445.08, surplus, \$295,414.81.

The number of national banks in the State at the beginning of the year was eighty-three, having an aggregate capital of \$24,505,410. The surplus fund of these banks amounts to \$6,908,034.74, and they hold as undivided profits \$1,937,197.38. Their outstanding circulation, in common with all of the country, has

suffered a reduction of several millions, the amount now being \$8,698,698. They hold as individual deposits \$24,478,665.09, and their total liabilities reach the sum of \$70,295,835.20.

There have been but two failures among the national banks of the State, the first of which, the First National of Bethel, paid in full. The latest is the failure of the Stafford National, of Stafford Springs.

Since the origination of the national banking system, ninety-six banks have been organized in Connecticut, but thirteen have ceased to exist. During the year two national banks, representing a capital of \$102,450, were closed, and two, representing a capital of \$200,000, were organized. The circulation of the closed banks outstanding amounts to \$50,169; and the circulation issued to the new beginners is \$45,000.

Railroads.—In 1887, the railroad mileage of the State was increased by the construction of 11.6 miles of new road by the Meriden and Waterbury Company, making the total mileage in January of this year 1,159 miles. Upon the subject of abolishing grade-crossings, the Railroad Commissioners report that, during 1887, 41 petitions involving 70 crossings were presented to the board, all of them from the Consolidated Railroad. Over 60 hearings were given on these petitions, and orders made for the abrogation of 32 crossings on terms favorable to the respective towns interested. Thirty-seven petitions were pending at the end of the year, but the danger of a wholesale removal of grade-crossings, feared at one time during that year, has been averted by the conservative course of the board.

Militia.—The last report of the Adjutant-General shows the total strength of the militia, according to the last muster, to be 2,513 officers and men. The number of men in the State liable to military duty is 82,591.

Charities.—At the State Hospital for the Insane there were, on June 30, 568 male and 724 female patients; a total of 1,292. This is an increase of 146 patients in two years. Between June 30 and the end of the year there was an unusually large number of admissions, bringing the total nearly up to 1,400, the limit to the capacity of the hospital. The trustees report the institution to be in a highly satisfactory condition; they oppose any further additions to the buildings, as there are already as many patients as can be satisfactorily managed at one institution.

The Putnam Statue.—By a vote of the State Legislature in 1886, a commission was created and the sum of \$10,000 appropriated for the purpose of erecting a suitable monument to Gen. Israel Putnam, of Revolutionary fame, who was a native of the State. Pursuant to this act, an equestrian statue was erected over the remains of Gen. Putnam at Brooklyn, a small town in Windham County, and on June 14 of this year, the unveiling and presentation ceremonies took place. Governor Lounsbury, in behalf of the State, accepted the memorial

from the commissioners, a commemorative address was made by Henry C. Robinson, of Hartford, and other appropriate exercises were held. The State thus rescues from neglect the resting place of one of its distinguished sons.

Political.—The Prohibition State Convention, held at Hartford on August 1, placed in nomination the following ticket: For Governor, Hiram Camp; Lieutenant-Governor, Nathan Babcock; Secretary of State, Theodore I. Pease; Treasurer, George W. Kies; Comptroller, Edward Manchester.

The usual declarations in favor of prohibition were adopted, together with the following:

That the Sabbath should be preserved and defended as a civil institution without oppressing any who religiously observe the same on any other day of the week.

That a uniform system of laws concerning marriage and divorce and social purity should be adopted.

That the immigration of paupers and convicts should be prohibited.

That the purity and freedom of suffrage should be provided for by the adoption of the so-called Australian system of voting by secret ballot, and that only citizens of the United States should be allowed to vote in any State.

The combinations of foreign syndicates or native capitalists to control the production and sale of necessary products or to monopolize great tracts of land should be forbidden.

On August 14 the Republicans met in convention at Hartford, and nominated the following candidates without a contest: For Governor, Morgan G. Bulkeley; Lieutenant-Governor, Samuel E. Merwin; Secretary of State, R. Jay Walsh; Treasurer, E. S. Henry; Comptroller, John B. Wright. The platform, omitting some unimportant features, is as follows:

We approve the declaration of principles contained in the platform of the Republican party, adopted at Chicago.

We are hostile to the theories of free trade and to the Democratic idea of a "tariff for revenue only."

We believe that the unexampled prosperity of this country and the elevated condition of our people are due chiefly to the policy of protection which has been adopted and continued by the Republican party, and we therefore favor such tariff laws as will in the future protect American labor and industries against the ruinous competition of the underpaid labor of foreign countries.

In this State the Republican party has put in operation the existing law restraining the sale of intoxicating liquors. That law recognizes our ancient theories of local self-government and places it in the power of every town to prohibit the sale of intoxicating liquors within its limits. We favor the principles of that law and pledge ourselves to such additional legislation as may from time to time be found necessary to suppress the evils of intemperance.

We favor such legislation as will provide for the compulsory secrecy of the ballot, and secure free suffrage and an honest counting of ballots throughout the country.

We recognize the services and sacrifices of the veteran soldiers and sailors of the republic and favor liberal pension legislation in their behalf.

The nominees of the Democratic State Convention held in New Haven on September 4, were: for Governor, Luzon B. Morris; Lieu-

tenant-Governor, John S. Kirkham; Secretary of State, Henry A. Bishop; Treasurer, J. Griffin Martin; Comptroller, Nicholas Staub. The platform approves the national ticket and platform, the tariff-reform message of the President, the Mills Bill, and the fisheries treaty, as well as the administration of President Cleveland in general. Upon State questions it says:

The Democratic party again renews its demand for that privilege to which every voter is entitled, the secret ballot. Freemen will not readily accept the recent promise of the party that has in the Legislature repeatedly set aside their hopes, and defeated this important measure of protection against intimidation.

We emphatically protest against the policy of extending to partisan boards, for party purposes, the authority to issue and control liquor-licenses. These boards, in justice to the people, should be non-partisan—not, as now, mere political machines used for the success of the Republican party. Too frequently the test of an applicant's fitness for license is measured by the benefit to be derived by the party which controls the boards.

A fair choice of the voters of Connecticut expressed through the ballot-boxes, in the election of State officers, should be respected in Connecticut as it is in thirty-four States of this Union. Our Constitution should be reformed and admit of an election of Governor and other State officers by a plurality of votes, as presidential electors are chosen in every State, so that a candidate lacking more than 9,000 votes of a majority, and more than 1,900 votes of the number received by his opponent, may not be treated as duly elected, and inaugurated.

There was also a Labor ticket in the field, headed by A. F. Andrews. At the November election Morris (Democrat), received 75,074 votes for Governor; Bulkeley (Republican), 73,659; Camp (Prohibition), 4,881; and Andrews (Labor), 278 votes. Although the Democratic ticket received a plurality of 11,415 votes, it did not obtain a majority over all, which is necessary under the State Constitution for an election. The decision is therefore thrown upon the next Legislature, whose members were chosen at the same November election. This legislature will consist of 17 Republicans and 7 Democrats in the Senate, and 152 Republicans and 96 Democrats in the House, with 1 Independent. The Republican ticket will therefore be chosen. The vote for President was as follows: Harrison, 74,584; Cleveland, 74,920; Fisk, 4,234; Labor ticket, 240. The Congressional delegation stands 8 Republicans to one Democrat, against 3 Democrats and one Republican in the last Congress.

CO-OPERATION. Each country has its special form of co-operative effort. In Germany it is the credit-unions, sometimes called the peoples' banks. These societies numbered 1,910 in 1883, and, in connection with nearly as many more co-operative societies of various kinds, had 1,300,000 members, with \$50,000,000 share capital and \$122,500,000 borrowed capital, and did a yearly business of \$500,000,000. The credit-unions resemble joint-stock companies, having among others the important additional features that the stock may be paid for in small regular payments, that every stock-

holder is liable for the entire debts of the bank as in a simple partnership, and that the money gathered from the stock and from funds borrowed by the unions is loaned to their members at 6 to 10 per cent. interest. This not only encourages saving, but enables a poor but bright mechanic to obtain at reasonable interest money with which to begin business. These credit-unions, which were founded by Dr. Schulze, of Delitzsch, Saxony, in 1850, have also grown to large proportions in Austria, 1,129 such unions, or 74.5 per cent. of all the co-operative societies of that country in 1881 being of this nature.

In France, although many distributive societies are reported, and in Paris over seventy workingmen's co-operative societies are engaged in production, mostly on a small scale, the greatest success has been in profit-sharing, wherein the proprietors of a large manufactory, shop, railroad, or insurance company, give their employes, in addition to wages at market prices, a percentage of the net profits. Only a few of those that have tried it have abandoned the plan, which arouses the workman's zeal and increases his efficiency in such a degree as to restore to the managers, it is believed, a full equivalent for the dividend. Of the 98 firms in Europe, since grown to 104, which in 1883 thus shared profits with their help, 49 were in France, 18 in Germany, 12 in Switzerland, and 8 in England. Twenty-three had begun prior to 1870, and 38 more prior to 1880.

In England the greatest success has been in distributive co-operation or store-keeping on the so-called Rochdale plan, to be briefly described below, which was brought to public notice by the Rochdale pioneers in 1844. At the end of 1887 there were in England and Scotland 1,848 such retail co-operative stores, with 858,237 members, £3,461,888 share capital, £968,175 loan capital, sales in 1887 of £22,843,651, and a net profit of £2,940,337. There were also 15 supply associations, selling at little above cost, with 63,841 members, £642,860 share and loan capital, and a trade of £2,754,264. There were also an English and a Scotch wholesale society, with a share and loan capital of £1,120,874 and sales of £7,274,494 to the retail societies. The 1,432 co-operative societies of all kinds in Great Britain reported at the last Co-operative Congress in 1888 had a membership in 1887 of 945,619, a share capital of £10,012,048, sales of £34,189,715, and profits of £3,198,178. The growth has been steady for a long time. To the surprise of all, 721 of 1,255 societies in Great Britain reporting in 1887 gave credit.

At the twentieth annual Co-operative Congress in England in 1888, 67 productive societies were also reported, with 22,480 members, £651,869 shares, and £207,718 loan capital, a business of £1,574,145, and net profits of £59,500. There are no returns of the methods of dividing profits, but this defect will be reme-

died this year. It is known that most of the societies give no share of their profits to non-stockholding workmen; but the demand on the part of co-operators is rapidly growing. Of the 77 productive societies that had been in business or were just beginning in England, Wales, and Scotland at the close of 1887, 17 were in cotton, linen, silk, and wool, 12 in leather, 10 in metal, 9 in flour, 6 in farming, 4 in printing, and 19 in as many different kinds of manufacturing.

If the announced aims of the leaders of co-operation in England are realized in any such degree in the next twenty-five years as they have been in the past twenty-five, we may look for a great growth of that for which previous success has prepared the way, namely, co-operative production, wherein labor shall share in the profits of manufacturing, and, through the organization of consumers already secured to the extent of over 800,000 families, shall be able to deal a serious blow at the sweating system and other devices of those employers who, in the rage to produce more cheaply than their rivals, offer their employees ruinously low wages or unhealthful conditions of employment.

The great success in the United States has been in building and loan associations, which are as distinctively American as the credit-unions are German. Still, there are some successful and now rapidly growing stores, and these as the simplest and historically the earliest form of co-operation in this country may be first considered.

Distributive Co-operation.—The co-operative store, and much later the factory, were introduced and fostered for a long period by organizations of workmen. Most of these organizations have given place to others having different objects, until to-day nearly all successful co-operative enterprises are carried on independently of any organization and even of each other. The first attempts at co-operation between 1847 and 1859 were made in New England by the New England Protective Union. Nearly all failed after a time, from lack of the co-operative spirit and from ignorance of the best methods. In trying to sell for cost, as did these union stores, the average manager is usually confronted with a deficit at the end of each year because of unexpected but inevitable depreciation of goods and from other losses. The bitter rivalry of private stores is also aroused. The latter will sell some staple article even below cost, and, by widely advertising this particular article, will draw off the trade of unthinking men from the co-operative store, which may, on the whole, be selling cheaper.

The next attempt at co-operation was made by the Patrons of Husbandry, known also as Grangers, and in the South recently as "The Wheel." (See "Annual Cyclopædia" for 1886, page 42.) This is often associated exclusively with the celebrated granger legislation against

the abuses of the railroads, but in reality it has accomplished a great deal for its members in education upon practical farm topics and in many other ways, not the least of which has been the result of its co-operative features. These features have been in part represented by purchasing agencies, which bought machinery, groceries, and dry goods for the farmers or sold their products in the large cities on orders from the local unions. Still more important and common has been the concentration of all the trade of the members of a local grange or even of a State grange on a strictly cash basis at such wholesale dealers and manufacturers as would sell at the lowest prices all things needed on the farm and in the home. In hundreds of cases, too, grange stores have been established on the faulty plan just described of the old union stores—that is, selling at or near cost. Some of these stores continue prosperous, as at Torrington and Lebanon, Conn., but most have failed from the same ignorance of approved methods, from inability to find managers who possessed the knowledge lacking in the members, and from the same absence of the co-operative spirit which caused the downfall of the union stores. Yet, aside from the great educational value even of failure, these grange stores, as well as the methods of concentrating trade upon establishments that would give special discounts, have been a great help to the farmer in forcing down in private stores the general level of prices, which in the seventies were often exorbitantly high.

To the now extinct order of the Sovereigns of Industry belongs the credit of having propagated extensively in this country the best methods of distributive co-operation embodied in the Rochdale plan. The essential superiority of this plan over others lies in its provision that goods shall be sold at regular retail prices, and any profits above what is sufficient for a reserve fund and interest on capital are paid to customers annually or semi-annually, in proportion to their trade for the period, though stockholders may receive a larger per cent. of dividend on their trade than outsiders. The other provisions, such as shares of small value, limitation of the number that one can hold, and the allowance of but one vote to a stockholder independent of his shares, are common to other systems. This is the plan on which most of the English and permanently successful American stores have been managed since it was introduced in England by the Rochdale Pioneers in 1844, and brought to general attention in this country thirty years later by the Sovereigns of Industry.

The latter organization, founded by William H. Earle, of Worcester, Mass., in 1874, devoted most of its strength during its six years' life to the spread of distributive co-operation. For two years paid lecturers, well acquainted with the most approved methods of co-operation, were kept in the field to organize local councils and help them to establish stores in the

right way. In 1875 the 810 councils reporting at the annual meeting of the order returned a membership of 27,984. Of these the majority went no further than to obtain discounts at private stores, and many stopped with merely the educational features; but in 1877, 94 councils, having a membership of 7,273, reported an average capital in their stores of \$884, and a total business of \$1,089,372, at an average saving to the members of 14 per cent., or an aggregate profit of \$152,512, equal to a saving of \$21 to every man and woman belonging to those councils. But the organization had its birth at the worst time for success in the past twenty-five years. It was during the prolonged financial depression following 1873, when thousands who had joined the order could not get work and felt obliged to resort to private stores that would trust. Then, too, the growth had been too rapid to permit of wise management; the knowledge of English methods was too little diffused at the start, and especially were there too few possessed of actual experience in the Rochdale stores who could be made managers of the new enterprises. Fortunately, all these difficulties time and education may remove, in fact are already removing, as appears from the considerable number of successful stores to be found in New England, New Jersey, Kansas, Texas, and in a less degree in some other sections and States. Several of the largest of existing stores are survivals of the Sovereign enterprises.

In 1866 there were 53 co-operative stores in New England, with an aggregate trade of \$2,000,000 and a capital of about \$210,000. In Texas there were 155 co-operative stores, all connected with a central association con-

amounted to \$296,576.12 in merchandise and 8,757 bales of cotton, an increase of over \$100,000 during the year. Ten-per-cent. dividends were paid on stock, and the remaining two thirds of the \$16,820.83 were in part placed in the contingent fund and in part divided among the 602 association and individual stockholders. The entire number of stockholders of the central and subordinate associations exceeds 6,000.

Next in size is the Johnson County Co-operative Association, of Olathe, Kansas, which has been in business since July, 1876, on the Rochdale plan of dividends on trade. Its sales in 1887 amounted to \$245,000 and its capital to \$66,000, if the surplus of \$16,000 be included.

The Philadelphia Industrial Co-operative Association, began in 1874 on the Rochdale plan, reported a trade in 1886 of \$171,278.04, divided as follows: Groceries, \$123,636.16; meat, \$19,772.11; dry goods, \$8,908.83; boots and shoes, \$18,499.94; coal, \$5,461.50; total, \$171,278.04. The capital, in the hands of 2,355 members, and invested in a central and three branch stores, amounted to \$40,000.

At Allegan, Mich., is a co-operative store with \$30,000 capital and a trade in 1887 of \$165,884.09, which sells everything at 4 per cent. above total cost, and keeps down expenses to 4.1 per cent. of the trade. This is the best showing made by any co-operative store as far as known in the United States.

Among the other large and vigorously growing co-operative stores of the country should be mentioned the ten next in size to the four already considered. For convenience, the entire fourteen are included in this table:

No.	NAME.	Location.	Trade in 1887.	Capital.
1..	Texas Co-operative Association	Galveston, Tex.	Over \$500,000	\$68,885
2..	Johnson County Co-operative Association	Olathe, Kan.	245,000	66,000
3..	Philadelphia Industrial Co-operative Association	Philadelphia, Pa.	171,278*	40,000
4..	Allegan Co-operative Association	Allegan, Mich.	165,884	30,000
5..	Beverly Co-operative Association	Beverly, Mass.	124,901*	7,000
6..	Trenton Co-operative Society	Trenton, N. J.	93,000	9,219
7..	Arlington Co-operative Association	Lawrence, Mass.	97,909	19,190
8..	Sovereigns Trading Company	New Britain, Conn.	90,000	17,500
9..	Sovereigns Co-operative Association	Webster, Mass.	76,800	5,000
10..	Industrial Co-operative Association	New Bedford, Mass.	74,000	18,013
11..	Riverside Co-operative Association	Maynard, Mass.	62,684	19,533
12..	Hammonton Fruit-Growers' Union	Hammonton, N. J.	60,944	17,131
13..	Progressive Co-operative Association	Worcester, Mass.	41,897	4,961
14..	New Brunswick Co-operative Society	New Brunswick, N. J.	36,487	3,223

All but Nos. 1, 4, 5, and 13 are on the Rochdale plan.

* In 1886.

ducted by the Patrons of Husbandry; the total capital of these stores in 1885 was returned at \$744,500, and the trade was \$1,977,579.90. The central association, called the Texas Co-operative Association Patrons of Husbandry, whose headquarters are at Galveston, reported at the tenth annual meeting, in July, 1888, a capital of \$68,885, owned by 226 co-operative associations and 876 individuals, in all parts of the State. Each branch association trades and divides the profits on its own account. The trade of this central association

In order to determine the growth of co-operation in 1887 over that in 1886, when full returns from most of our co-operative enterprises were secured, circular letters were sent to the largest of these. Only two (and those were small enterprises) are known to have failed—namely, an old store at Seneca Falls, N. Y., which committed the fatal mistake of selling on trust, and a new, poorly managed enterprise in Buffalo, N. Y. These failures are more than offset by the rapidly growing trade of several new stores, one of which—the Phillipsburg

Co-operative Store No. 1, of Phillipsburg, N. J.—reported a trade of \$32,983 in 1887. Of the twenty stores, including twelve of the fourteen given in the table above, which made complete returns, only five reported a decrease in trade. Excluding the large Texas store, lest its size and success overbalance the rest, the business of the other nineteen amounted to \$1,290,550, being an increase in one year of 24 per cent. If we include the Texas stores, the remaining thirty-nine in New England—which did business amounting to more than \$1,000,000 in 1886—and the twenty to thirty other successful stores in the country, we may safely estimate the entire distributive co-operation in the United States in 1887 at between \$5,000,000 and \$6,000,000. This is not a large sum in comparison with the figures in Great Britain; but, if the present rate of growth of 24 per cent. a year continues, co-operative distribution will soon assume an important position in our industrial life.

It is the common opinion that the price of goods to the consumer is raised by the retailer from 30 to 100 per cent. over the wholesale price. This is completely disproved, as far as co-operative stores are concerned (and other stores rarely charge over 5 to 10 per cent. more), by statistics, gathered by the writer, of ten large and successful co-operative stores, of which five are in Massachusetts, two in New Jersey, two in Pennsylvania, and one in New York. In these ten stores, which sold groceries and in some cases meat, and in 1886 did a business of \$420,494.20, the retail price was only 17.27 per cent. above the wholesale. The expenses for wages, rent, teams, freight from the wholesaler, depreciation of stock, insurance, ice, water-rent, taxes, stationery, and all other incidental running expenses, exclusive of interest on capital, amounted to 12.74 per cent. of the cost price, or nearly three fourths of the entire increase in price. Interest at 5 per cent. on the capital employed, which was returned as \$66,242 actually paid in, aside from surplus, would be \$3,312.10; this is almost 1 per cent. of the wholesale price, leaving only an average of 3.6 per cent. on the wholesaler's price that can be credited to profits, and which admitted in these stores of an average dividend of not quite 4.5 per cent. on the retail price.

The greatest cause of disaster in most co-operative stores that fail, next to trusting, lies in a high ratio of expense to trade. In eleven successful co-operative stores especially studied with regard to this point, the average percentage of running expenses to trade was only 7.7, and in no case did it reach 10. Few stores can succeed whose running expenses are allowed to equal 10 per cent. of the trade. Lavish expenditure for rent, teams, numerous employes, and a "stylish" appearance, wrecks many a co-operative enterprise. The idea of co-operation is substance rather than shadow—the best and purest goods—not display. One of the greatest savings of co-operation comes from the fact that

costly plate-glass show-windows, location on a main street, employes enough to be able to wait at once on all customers in the busiest hours of the day, and teams to carry home every small article, are not necessary to attract custom. If such be necessary, the first steps in co-operation have not yet been taken. A good, clean, wholesome store, in a convenient location, and one or two teams to deliver heavy goods, are, of course, requisite. But where a market is already secured among those banded together in a co-operative experiment, the need of the expensive means of advertising just referred to should no longer be felt. The very essence of co-operative distribution is the dispensing with the wastes of competitive business.

Productive Co-operation.—This is the ideal of all thinking co-operators, and the goal toward which their efforts are directed. But few steps toward it have been taken. The idea of its advocates is that the workmen in our manufacturing establishments should save money enough to establish factories of their own; should have the requisite knowledge of human nature to select able foremen and superintendents; and sufficient moral fiber to co-operate cheerfully and submit to the rigid discipline necessary in a successful manufacturing enterprise. The first requisite, capital, is more easily secured through the issue of stock in shares of \$5 to \$25 each than are the other conditions. But the few marked successes chronicled below indicate that the prospects of success are not as chimerical as has been supposed, and that, especially in enterprises like the making of barrels, boots and shoes, hats, watch-cases, and iron castings, where the zeal and efficiency of the workman count for more relatively to the capital and service of the manager than in other kinds of manufacturing, a considerable growth of co-operation may fairly be expected within the next twenty years. Through ignorance of men and methods, and lack of the moral qualities necessary to prevent all serious jealousies and dissensions, the vast majority of wage-earners are at present unfitted for productive co-operation.

The greatest success in this country is that of the co-operative coopers of Minneapolis. The oldest of the eight co-operative shops of that city, known as the Co-operative Barrel Manufacturing Company, was begun in 1874, and now has assets of \$45,000, owned in equal amounts, as the constitution requires, by each of its ninety stockholders. Only one who is a journeyman cooper, and known to be of good moral character, can become a stockholder. If he is unable to pay the full value of a share at once, an assessment of from \$3 to \$5 is paid from his weekly wages, when the shop is running full time. Five per cent. interest is given on stock. The men work by the piece, and divide among themselves, according to their work, all the ordinary gains or losses of the business. But gains or losses coming from fire, from non-paying creditors, from changes in the value of

real estate held, from the work of hired help, or from outside ventures undertaken by the association, are apportioned according to the stock—that is, equally among all the members.

These eight companies, employing about two thirds of the 600 coopers in Minneapolis, are all organized on the same basis, and have been uniformly successful, having a steady local demand for their products from the largest flouring-mills in the world, and, excepting one defalcation of a few hundred dollars, have lost nothing of the several million dollars that during the past fourteen years have passed through the hands of their more than fifty treasurers. Owing to less need of expensive foremen, merely to see that they attend to their work, and owing further to their readiness, when forced by competition, to work on half-wages rather than stop, these coopers are recognized as able to undersell any private shops in the city; but the latter are sustained by some of the millers to guard against any possible combination to raise prices among the co-operative companies. The effects of this form of organization upon the morality and thrift of the men are extraordinary. Most of the coopers are now strictly temperate, and they are worth, in a large majority of cases, from \$2,000 to \$4,000 each. The average wealth of the 90 members of the oldest company is at least \$3,500. There is also a successful co-operative cooper-shop at Dundas, Minn., and one at Milwaukee. In the latter city is a flourishing co-operative association of plumbers which is increasing its capital in 1888 to \$50,000. In 1886, the date of the latest full returns at hand, the business amounted to over \$70,000, and included three fourths of all the journeyman-plumbers in the city. By dispensing with most of the foremen, these co-operators save nearly one third in the cost of plumbing. Profits have been largely divided on the basis of wages, but a part has gone to increase the capital. In 1886, the plumbers of New York city tried to organize co-operatively, and, according to one of their leaders, who has fallen heir to the business they were fast building up, they would have attained as great success as in Milwaukee, if they had only had the patience to wait a little longer and to work in harmony. At Lynn, Mass., is a co-operative shoe-factory, the Lynn Knights of Labor Co-operative Boot and Shoe Company, established in 1886, which is doing a successful and rapidly growing business with a capital of \$8,000. After paying 5 per cent. interest on capital, and devoting 10 per cent. of the profits to a sinking fund, and as much more to a co-operative fund to assist other co-operative enterprises, the remaining profits are divided equally between capital and labor. Each workman gets his share of the labor dividend, in proportion to his wages.

Most of the other co-operative manufacturing companies, give no dividends to labor as such, but the stock is in many hands, and the stockholder has but one vote. The following

are the most successful, and from their history of five to twenty-one years, give evidence of reasonable stability: Stoneham Co-operative Shoe Company, Stoneham, Mass.; Wakefield Co-operative Shoe Company, Wakefield, Mass.; Kingston Co-operative Foundry Company, Kingston, Mass.; Leonard Co-operative Foundry Company, Taunton, Mass.; Somerset Co-operative Foundry Company, Somerset, Mass.; East Templeton Co-operative Chair Company, East Templeton, Mass. These six companies, with a capital of \$125,000, do a business of about \$500,000. Outside of Eastern Massachusetts the most successful are the Solidarity Watch Case Company, in Hope Street, Brooklyn, with 110 employees and \$67,000 capital, in 1887; the Fulton County Co-operative Leather, Glove, and Mitten Manufacturing Association, of Johnstown, N. Y.; the Co-operative Collar and Cuff Company, of Troy, N. Y., with a capital of \$15,000, and business of nearly \$40,000, in 1888; and the St. Louis Furniture-Workers' Association. The sales of this latter in 1887—nine years after beginning business—were \$118,520, and the wages paid, mostly to stockholders, were \$43,421.

Co-operative Building and Loan Associations.—By far the most important and successful form of co-operation in the United States is that of the Co-operative Building and Loan Association, sometimes called merely building association, or, as in Massachusetts, the co-operative bank. Beginning about fifty years ago in Philadelphia, and attaining to strength there in the decade of 1850-1860, they have been spreading rapidly since 1875 in Pennsylvania, New Jersey, Massachusetts, Western New York, Ohio, Illinois, Minnesota, and many other Western States, and are now reaching into the South. The capital of the co-operative bank is limited to \$1,000,000, in shares whose full value is \$200 each. The shares are not paid for at once, or within a short time of beginning business, as is usual with corporations, but are paid at the rate of one dollar a month, a new series of shares being issued semi-annually and annually. This would require two hundred months, or sixteen years and two thirds for the payment of a share, but for another feature of the system. The money accruing to the treasury from these monthly payments, and from all other sources, is loaned every month to such of the shareholders as offer the highest premium. The profits from these loans and premiums furnish the dividends, which usually amount to between six and seven per cent. Every one can borrow for aid in building or buying a home, to the amount of the par value of his share, but no more. As security he must offer his shares and such other property as may appear to the directors sufficient. They will lend nearly up to the full market value of such security, while the savings-banks are only allowed to lend to the extent of 60 per cent. of the assessed value of the real-estate security. It may be asked

how a poor man who has not real estate can borrow, even of a co-operative bank? The answer is, if he wishes to buy an estate he can borrow of the bank the greater part of the needed purchase money, and give as security therefor a mortgage of the property at the time he receives his deed therefor. Of course the bank can not furnish the whole amount of the purchase-money. But if one has a very little money and will subscribe to, say five shares, he can borrow \$1,000. A man can thus build a house, mortgaging it as security to the co-operative bank. The would-be borrowers, as has been said, bid for the privilege. Premiums range from five to fifty cents a share, but rarely over twenty-five cents for any length of time. The by-laws of the co-operative banks usually require the successful bidder for a loan to pay one month's interest and premium immediately. If a loan is not approved, a month's interest and premium are forfeited. Successful bidders can always obtain shares for their loan. If one borrow \$2,000 at fifteen cents premium a share (the average amount now prevailing in Massachusetts), he is subject to three monthly charges: First, a payment of ten dollars on his ten shares, which he had first to take before borrowing; second, a payment of one dollar and a half as a premium; and, third, a payment for interest, which, on \$2,000, at 6 per cent. (the usual rate), is \$10. In all, then, he pays \$21.50 a month, until his shares mature in about eleven years, when the bank will hold his note for \$2,000, and he will hold shares worth \$2,000. The two accounts are canceled, and thus for a little more than the expense of rent in the mean time a man finds himself owner of a comfortable home.

Any one with sufficient security—which, be it observed, most workmen have not—might borrow the \$2,000 of a savings-bank, pay 6 per cent. interest, the usual charge on such loans, or \$1,320 during the eleven years, and then pay the debt, making \$3,320. The same sum borrowed of a co-operative bank will involve a payment during the one hundred and thirty-two months, at \$21.50 a month, of \$2,835, besides the loss of, perhaps, \$400 more in compound interest to the close of the eleven years on these payments. Two things are to be said: First, it is not always necessary in Massachusetts, where money is more plenty than in the West, for one to pay a fifteen cent premium for a very long time. Whenever the borrower finds it possible to bid off \$2,000 for a lower premium, say five cents, he may do so, and with this loan pay off his other, borrowed at a higher rate, for one can repay his loan at any time, retaining his shares or not, as he chooses. The only charges are, that the borrower must pay double interest and premium for one month, and have a new mortgage made and the old one discharged. In some States, and occasionally in Massachusetts, the loans are bid off at so high a premium that the

actual payments, reckoning compound interest on them, are more than would be necessary if the money were borrowed from an ordinary savings-bank. But it may still be said that, human nature being as it is, scarcely one man in a thousand will make provision by constant voluntary monthly deposits in a savings-bank to repay his \$2,000 mortgage at the end of the eleven years. This is the real justification for the existence of the co-operative banks. Their shareholders feel compelled to make their regular monthly payments. Before the man is aware of it, he has paid for his home and acquired the valuable habit of saving. The results are in every sense satisfactory, six to seven per cent. dividends being generally made. Again, these banks enable the depositors, who are in most cases wage-earners, to use their own deposits, whereas the money deposited in the savings-banks in Massachusetts—\$300,000,000 in 1886—supplies the capital of the great employers of industry, and thus does not so directly promote the co-operative ideal—a larger share by the workmen in the profits of industry. In addition to nearly all the advantages of the justly famous postal savings-banks of Europe, the co-operative banks give much higher interest and keep the deposits for actual use among the lenders of the immediate neighborhood. By the Massachusetts law at least twenty-five persons must be associated together for organizing such a corporation, and no person can hold more than twenty-five shares, of the ultimate value of \$200 each, in one corporation. No member can have more than one vote. A member may at any time, on thirty days' notice, withdraw any shares not pledged as security for loans, after paying any fines that may be due. By so doing he loses such portion of the profits as was previously credited to the share, and must bear such a proportion of any unadjusted loss as the by-laws may determine.

In most of the older building associations in the Middle and Western States the premiums are not paid monthly, but are deducted in a lump sum from the face of the loan to the borrower. For example, if a man, in order to borrow \$1,000, offers ten per cent. premium, instead of receiving the \$1,000 and paying monthly ten per cent. in addition to the monthly payments of one dollar a share, he will in many banks receive \$900, but must take five \$300 shares as security on which five dollars a month and interest on the \$900 are paid. The Massachusetts plan, often called the installment plan, is now being adopted with increasing frequency by the new companies, and is simpler, and, many claim, more just to the borrower. Money is worth more and premiums much higher in Chicago and St. Paul than in Boston. Indeed, they seem unreasonably high, bringing in from fifteen to twenty per cent. profit to the depositors.

In the fifty-one co-operative banks of Massachusetts in 1887, the assets were \$4,211,948 to

the credit of 20,755 depositors, and 3,797 persons representing nearly 20,000 souls had borrowed this sum for aid in erecting homes. The growth has been over twenty per cent. almost from the opening of the first co-operative bank in that State in 1877. Premiums are low in Massachusetts, but the returns to depositors average fully six per cent. The first series of the first bank matured in 1888, after just eleven years. The payment of \$132 in monthly installments of one dollar thus enabled depositors to draw out at the end of the time an increase equal to five per cent. (of the entire \$132) from the beginning. In October, 1886, there were 37,780 depositors and 8,562 borrowers in the 151 building associations of New Jersey, the assets of which were \$9,300,705. In Hamilton County, Ohio, in which Cincinnati is situated, there were in 1888 340 associations with 60,000 shareholders and \$15,000,000 assets. The weekly deposit was \$167,000, and three fourths of all the mortgages recorded in the county are through these building associations. In 1886 there were eight of these associations in Minneapolis and forty in St. Paul. All were successful, and in fact not a single failure in the past five years has come to my notice, though a few must have occurred; the percentage of success is certainly higher than in most forms of private business. In Buffalo, N. Y., great good has been done by these wonderful promoters of thrift, and hundreds are the homes that the wage-earners of that city have obtained by their means. This might be said of hundreds of other cities and towns in this country.

But the greatest results are naturally to be found in Pennsylvania, and especially in Philadelphia, the birth place of the movement. In 1886 there were over 90,000 shareholders and 15,000 borrowers of the 400 building associations in Philadelphia. The assets of 120 were nearly \$3,749,339.17. It is safe to say that in the more than 1,200 co-operative building associations of the State there are over \$50,000,000 assets owned by nearly a quarter of a million depositors, and borrowed by over 40,000 families representing 200,000 persons, who are thus enabled to build and pay for homes which, without these invaluable banks, they would have been forced to rent.

Only one thing seems needed to secure their safe as well as rapid growth. The Massachusetts legislation, which carefully provides against recognized dangers in management and which requires full reports, as in the case of the no more complicated or important savings-banks, should be everywhere adopted; although a few minor changes would be needed to provide for those associations already doing business on systems different from that prescribed in Massachusetts. All new associations might be required to conform to the Massachusetts plan. Reports to the bank commissioners of each State should be required for subsequent publication. If this be done, the future of this peculiarly American form of co-operation will

be secured. But if such legislation is not speedily had in some States the collapse of many associations will surely follow, and work great hardship to thousands.

Co-operation is so useful in diffusing a knowledge of business methods, in giving the discontented masses an insight into the difficulties that capitalists as well as laborers must endure, and, finally, when successful, in elevating the condition of all participants, that the present needless obstacle of defective legislation in the way of successful co-operation should be speedily removed. Only Massachusetts has as yet made much progress in this direction, and she has not gone far enough. As in savings-banks and building associations, the State should prescribe methods of procedure.

Bibliography.—See Annual Reports of the British Co-operative Congresses, and the English Parliamentary Report in 1886, on Co-operation in Europe; Report for 1886 of the Massachusetts Bureau of Labor Statistics; the "Westminster Review" for October, 1885; "Workmen Co-operators," by Acland and Jones; "History of Co-operation," by Holyoake; "Co-operation in the United States," edited by Profs. H. B. Adams and R. T. Ely, of Baltimore, and written in 1886 and 1887 by five graduates of the Johns Hopkins University, who divided the field among them; and the Massachusetts Labor Bureau Report for 1886 and the New Jersey Reports for 1886 and 1887.

CORDAGE. Twisted fibers of any material, when less than one inch in circumference, are known as cords, twines, threads, strings, yarns, lines, and the like. When several of these are twisted or laid together, forming a line more than one inch in circumference, it is called a rope. In the trade and with sailors, the size of a rope is always designated by the measure of its circumference; with landmen and non-experts, it is designated by the diameter. It is easier and more accurate to measure the circumference than to measure the diameter, owing to the depressions between the strands; hence the former method is preferable, and in this article, when the size of a rope is mentioned, it will be understood that the circumference is meant. In modern practice, vegetable fiber, iron or steel wire, and, to a limited extent, animal fibers are used in the manufacture of rope. In commercial parlance, many substances are called "hemp" which are not really the product of that plant. Thus "manila hemp" is from a species of banana. Sisal hemp is from the leaves of the Central American agave, etc. The following list describes many of these substances in detail, but the word hemp must be taken in a commercial sense, as usage has in many cases decreed its application to fibers that merely resemble those of the true hemp.

Cair is the outer fibrous covering of the cocoa-nut. It is less used for cordage than formerly when rope cables were more commonly employed, but its lightness gives it certain advantages over hemp and manila. A rope made

from this material will float almost like cork, and when used as a cable ascends in a rising curve from the anchor to the surface of the water, instead of forming a dependent or sinking curve, as is the case with less buoyant material. Fresh water rots it, but salt water appears to have a preservative effect. It is still largely used by native sailors in the Indian Ocean. In preparing it for manufacture, the husks are soaked for some time in water and then beaten to separate the fibers from the dust with which they are surrounded.

Cotton is much used for the smaller ropes, rarely larger than three or four inches in circumference. It is comparatively weak, and retains moisture to an extent that renders it liable to rot. But it is easy to handle, is much used under cover, and to some extent on ship-board when not likely to be subjected to severe strains.

Hemp (*Cannabis sativa*) of the common commercial variety may be regarded as the rope-maker's staple. Asia is the native habitat of the plant, but it is now extensively cultivated all over Europe, and to a considerable extent in America. The plant usually matures at a height of eight or ten feet, but has been known to grow as high as seventeen feet. The stems are dried, beaten, and crushed in a hemp-mill, and then subjected to fermentation in water or moisture, and afterward beaten with mallets or passed through a machine called a "break." The fibers are separated from the bark and other waste substances, and are then hackled or combed into hanks or skeins, and packed in bundles of about 200 pounds each, for shipment. Good hemp-fiber is yellowish-green, smooth, glossy, and without odor. Russian and Italian hemp are considered the best for the general purposes of rope-making. American hemp is dark gray, and, while strong, will not stand the weather so well as the European varieties.

Hair is readily made into ropes by the ordinary processes of manufacture. It is used to some extent for lariats or tether ropes, and for various parts of harnesses and bridles, usually in sparsely settled or uncivilized countries.

Jute is prepared from the fibers of *corchorus olitorius* and *corchorus capsularis*. The cordage is very inferior in quality, and is only used when strength and durability are of no account. The main use of the fiber is in coarse textile fabrics, such as bagging, and floor-cloths.

Leather or Hide.—The hide is cut into strips when green, and laid up by hand or by machinery into small rope. It is used sparingly on board ship, where its toughness enables it to stand friction better than hemp, but it is only about one third as strong. It is also used for lariats or lassos.

Manila (*Musa textilis*) is chiefly grown in the Philippine Islands, and derives its commercial name from the capital town. It is often called "Manila hemp," but is, in reality, derived from the stalk of a species of banana. Rope made

from this substance is more buoyant than common hemp; is more pliable, causes less friction, and endures moisture better. Its strength, when new, is about equal to that of hemp. It is very extensively used by American rope-makers, and has largely taken the place of common hemp for maritime purposes.

Moss.—The long moss that grows on trees in the Southern United States is often made up into coarse rope for various uses, mainly in sparsely settled regions, where it is difficult or impossible to procure the commercial article. It is, of course, merely a make-shift, as it possesses neither strength nor durability.

Phormium Hemp is derived from the leaves of the *Phormium tenax* of New Zealand, a plant allied to the lily family. The leaves grow to a length of nine feet in their native habitat. When the fibers are carefully selected, the product is second only to manila for beauty and strength. During the civil war in America it came largely into use, mainly as an adulterant of manila, and the inferior quality of cordage thus produced is said to have brought the material into discredit.

Silk has, at times, been made into ropes of great beauty and strength, but their cost is so great that they are merely articles of curiosity or luxury.

Sisal, also called "sisal hemp," is the fiber of a plant closely allied to the American aloe or century-plant. The commercial name refers rather to the product than to the plant that yields it. The fibers of the various agaves are extracted from the thick leaves by pounding. They are most familiar in the "grass" hammocks commonly sold in the shops.

Sunn Hemp (*Crotalaria juncea*), known also as Bengal hemp. It is grown in many different provinces of Hindustan and in the Sunda Islands. The best comes from Comorcolly, and is very strong, white, and durable. It is the product of a papilionaceous plant allied to the pea family.

The whole art of cordage-making rests upon the mechanical principle that causes two or more single hair-like fibers, when twisted and laid side by side, to wind around each other on being released. The familiar device of twisting a piece of cord, doubling it upon itself, and then allowing the two parallel parts to relieve their unnatural torsion by twisting

FIG. 1.—AN EGYPTIAN ROPE-WALK, 1500 B. C.

around each other, exhibits the fundamental principle of the rope-maker's art. Long experiment has established to a nicety the exact degree of torsion necessary to secure the best

results with the different fibers in use. If the fibers or any of them are twisted too much, the finished rope is weakened, and has a tendency to kink; if too little twist is given, the rope is "dead," and the fibers do not properly combine their strength.

Fig. 1 is copied from a tomb at Thebes, of the time of Thothmes III, the Pharaoh of the Exodus. It represents the interior of a rope-maker's shop, and cleverly indicates the material used (leather) by showing the hide of an animal, presumably a goat, and two coils of thongs cut from the hide and ready for laying up into rope. The Egyptian rope-makers worked in couples. One sat on a stool and payed out the yarns, while the other, with a belt about his waist, walked backward, twisting as he went, and regulated the tension by his weight. The yarns were made fast to a swivel-hook, which in turn was attached to the belt, and a weighted lever or twister enabled him to apply the necessary force of torsion. Hemp, papyrus-fiber, palm-fiber, and hair were also used by the Egyptians and by other nations of antiquity in rope-making.

The initial factor in modern rope-making, shown in Fig. 2, is known as the "rope-maker's

large wheel gives nine turns to each of the small ones and their respective hooks.

The winch is generally used to make over old junk into serviceable stuff. In this case, one end of the length of junk is attached to the looper, and the other end is untwisted sufficiently to allow the separate strands to be attached to the winch-hooks and insert the top. By turning the crank in the required direction it is evident that the twist will be removed simultaneously from the rope and from the separate strands that compose it. By reversing the motion of the crank the rope can be again laid up as it was before, or fresh yarns can be substituted when required, and the junk made over into serviceable rope. When new rope is to be made, fresh yarns are attached to the winch-hooks, the other ends being made fast to the looper, and the crank is turned until a sufficient tension is imparted to the separate strands. The top is then inserted between the strands near the looper, and the crank is turned in the opposite direction. This permits the strands to twist around one another, the process being followed up and regulated by a man who holds the top. When four-stranded rope is handled, the heart, or core, passes through a central hole in the top and is attached to the large central hook of the winch.

Such is the simplest process of rope-making by machinery, but it is largely a hand process requiring at least one man at the crank, one or two at the top to overhaul the separating or uniting strands, and a third or fourth at the looper to regulate the strain upon the entire length of rope. In manufacturing rope on a large scale, far greater rapidity of action is essential, and further combinations of machinery are necessary.

The process with hemp is taken as the standard. When the bales are opened the fibers are found somewhat loosely folded in large hanks or bundles looking like masses of flaxen hair. These are hackled (sometimes spelled "beckled") or combed out to remove the dust, woody fiber, and the like. The hand-hackle is a board set at a steep incline, and having at its upper end a row of strong sharp steel hooks. The hackler throws the end of the bunch of hemp against these hooks, which engage it and hold it firmly, while with a coarse comb he straightens out the fibers and with a sharp knife cuts away foreign substances. Machinery has been invented that does away with hand-hackling. When the first hackling is done by hand, the hemp is then thrown into a box and subjected to a further hackling process by machinery. This is effected first by a "spreader," a sort of endless comb formed by steel teeth about three inches long set in an endless band, which revolves over drums. The hemp is fed to the spreader at one end and is gathered into a loose strand called a "sliver" at the other end. Thence it passes over "drawing-boards," not unlike the spreaders in construction, but which move faster, reduce

FIG. 2.—ROPE-MAKER'S WINCH.

winch." Such machines are often carried on shipboard. With an ordinary winch, about fifteen inches in diameter, it is possible to make good two-inch rope. A is the plan of the cogged wheels, B is a "looper," or swivel-hook, to which the farther ends of the yarns are attached. C is the winch complete and in service, and D is the "top"—a conical piece of hard wood scored at the sides, so that it can be grasped by the hand without checking the passage of the strands. Four hooks are provided, so that either three-stranded or four-stranded rope can be made, and the central hook is used upon occasion for giving an extra twist to large rope—"hardening it up," as the sailor's phrase goes, a service for which the small hooks are not strong enough. One revolution of the

the size of the sliver, arrange the fibers that compose it smoothly side by side, and deliver it at last in a continuous band, which falls naturally into coils in a box as it leaves the machine. When the box is full, the sliver is severed and the box is wheeled away to the

this way is commonly known as "patent cordage" as distinguished from the old-fashioned irregularly laid varieties.

The bobbin-stand and the perforated plates just described are at one end of the "rope-walk," a name appropriately derived from the

FIG. 3.—A ROPE-WALK.

A, bobbin-frame; B, yarns leading from the bobbins; C, a row of perforated plates (see also Fig. 4); D, strands or readies; E, winch, similar to C, Fig. 2; F, a fixed pin, to which the readies (f) are attached when hard twisted. The car moves with the arrow. K, point of attachment for the readies when about to be laid up; I, readies reaching from end to end of the walk; H, the top (see also D, Fig. 2); G is the finished rope. The car moves with the arrow.

"spinner," where it is again passed over toothed brands, which further reduce it, and suffer it, when it contains the proper number of fibers, to enter a tube, on emerging from which it receives a twist to the right and is at once converted into yarn and wound upon large spools or bobbins ready to be sent to the rope-walk or the machine-room. In the former case they are set upon a frame as at A, Fig. 3.

At this point one of the chief differences between old and new methods comes in. Hand-made rope assembles the yarns in a strand, but a yarn that begins on the outside of a strand may find its way to the inside and out again, thus varying the strain to which it may be subjected. In modern machinery the yarns, B, are led from the bobbins through holes in circular plates at C, Fig. 3, and shown in detail in Fig. 4. The holes, made large enough to permit the free passage of the yarns, are bored in concentric circles as shown. Through them the yarns pass to a tube the exact size of the required strand, and then receive the twist from left to right that lays them together in their permanent relation (D, Fig. 3). Obviously the yarns that pass through the outer circles of holes will remain on the outside of the strand, and in like manner each of the concentric circles of perforations delivers its own layer of yarns, so that each yarn has its place marked out for it through the entire length of the strand. Rope that is made in

methods followed by the rope-makers of antiquity, as seen on the sculptured tombs of Thebes. Rope-walks are often 1,000 to 2,000 feet long. The one at the Charlestown (Mass.) Navy-Yard is 1,860 feet long, and in them the best cordage is always made. Devices for dispensing with the "walk" are used, but their product, until recently, was, in technical parlance, "dead" as compared with the product of the rope-walk. An expert recog-

FIG. 4.—PERFORATED PLATES.

nizes machine-made rope in an instant, even without touching it, but there is no recognized difference in the market price.

After passing through the plates and tubes just described, the strands are attached to swivel-hooks on a frame similar to the rope-maker's winch previously described, but in this case mounted on a car (E, Fig. 3), and the ends are drawn away by machinery down the rope-walk, the hooks revolving at a furious

rate, while a skilled workman superintends the process as the work progresses. In a word, the "winch" in a rope-factory is mounted on a tram-car, while the bobbin-frame remains stationary.

As many strands can be twisted at a time as there are hooks on the winch, and their length is only limited by the length of the rope-walk. When the car reaches the end of the walk the strands, or as they are now called the "readies," are removed from the hooks and fastened to stationary hooks or pegs. At the same time the yarns are out at the other end of the walk, and there also the ends of the readies are made fast, and the long, hard-twisted strands lie side by side, reaching from end to end of the rope-walk.

In large factories the walks are equipped with double tracks, one of them devoted to the final laying up of the rope. For this purpose a car is fitted with a standard, which supports a "top" like that shown in Fig. 1. When it is desired to lay up a rope, the readies are shifted to the other track, and inserted in the scores of the top as seen at D, in Fig. 2, and at H, in Fig. 3; the ends of the strands are released and, aided by machinery which propels the car, the strands begin to twist firmly around one another. The car, as it advances about as fast as a man can walk, leaves a perfect rope behind it (as at G, Fig. 3), which when finished

independently of the other (see arrows near A A A, Fig. 5). At the same time all three of the bobbins are geared to a large outer frame, F F F, that revolves in a contrary direction as indicated by the large arrow. In practice this large frame stands facing toward O. It is here shown at right angles to its proper position, to simplify the drawing.

When set in motion the action of the machine is perplexing to the eye, and it is scarcely possible to follow its movements. The strands B B B are led from the flying bobbins to a tube the size of the required rope, and the reversed motion of the large frame, F F F, gives the necessary twist to the combining strands just as they enter the tube C. From the other end of the tube they emerge in the form of a rope or cable (D), of any desired size, according to the size of the machine. This is carried directly to a reel (E), and is coiled up ready for shipment. The largest rope-machines are not more than thirty feet long—a great saving in space when compared with the 1,000 feet or more occupied by a rope-walk. Moreover, machine-made rope can be produced of any desired length; 8,000 feet is not uncommon for drilling cables, whereas the product of a rope-walk must frequently be spliced. John Good has invented a machine that does the spinning and laying at one operation.

Fig. 6 shows the different kinds of cordage

FIG. 5.—A ROPE-MAKING MACHINE.

A, A, A, bobbins carrying twisted readies, and so geared that they can revolve end over end with the arrows; F, F, F, a large frame supporting the bobbin-frames, and geared so as to revolve with large arrow; B, B, B, readies receiving a double twist from the reversed action of the bobbin-frames; C, forming-tube; D, finished rope; E, reel.

is as long as the walk itself, less what is taken up by the twist of the strands.

The machine process of rope-making is more difficult to describe, owing to the complicated operations involved. In Fig. 5, let A A A represent large bobbins or spools filled with readies or twisted strands. These are mounted on axles set in frames, which have other axles or gimbals of their own, so that while the strands are being reeled off from the bobbins, the bobbins in turn can revolve end over end, each

in common use. A is *right-handed*, or *plain laid* rope—the ordinary rope of commerce—having three strands. B is four-stranded or shroud-laid rope, also right-handed. The fifth strand marked *a* is the heart of soft stuff, and is necessary in rope of this character because four strands can not be laid up together without leaving a vacant space in the middle. C is *cable-laid* or *hawser-laid* rope, composed of three plain laid ropes, and therefore left-handed, since the completed rope must have

a twist contrary to its own strands (the strands in this case being right-handed, three stranded

FIG. 6.—THE LAY OF CORDAGE.

rope). This kind of rope requires an extra twist to harden it and render it impervious to water, but this detracts from the strength of the fiber; besides, it stretches considerably under strain. Plain laid rope, moreover, contains more yarns than hawser-laid. Their relative strength is as 8·7 to 6. A new process gives a cord substitute for binding-wire, used by farmers, of which \$11,000,000 worth was used in the United States in 1888.

About \$25,000,000 are invested in the manufacture of cordage in the United States. About 8,250 spindles are in use, including those used for rope and twine. The consumption of hemp is 104,000,000 pounds annually, representing an equal weight of the finished product. It is impossible to ascertain even approximately the relative proportions of the different sizes and qualities.

White rope.—This term is commonly applied to all rope made of untarred hemp. It is the strongest cordage adapted to ordinary use.

Back-handed Rope.—In this the strands are given the same twist as the yarns, right-handed that is. Of course this must be a forced process, since they tend to twist together left-handed. When closed, therefore, they form a left-handed rope. It is more pliable than the plain laid and is less likely to kink.

Four varieties of hard-service rope are used in the United States Navy, namely, hemp, manila, hide, and wire. The sizes furnished in the equipment of a man-of-war range from 1½ inch (15 thread) to 10 inches inclusive.

A rope-yarn of medium size should sustain a weight of 100 pounds, but owing to unavoidable inequalities in distributing strains the strength of a finished rope can not be fairly estimated by multiplying the number of yarns by 100. The difference in the average strength of a yarn differs with the size of the rope, thus in a 1½-inch rope the strength for each yarn may be estimated at 104 pounds, while in a 12-inch rope it is equal only to 76 pounds.

The navy rules for ascertaining the breaking strain of Government rope are as follow:

White rope or untarred hemp. Multiply the square of the circumference in inches by 1371·4.

Tarred hemp. Use 1044·9 as the multiplier.

Manila rope. Use 783·7 as the multiplier.

The answers will nearly equal the breaking-strain in pounds.

Iron-wire rope. Multiply the weight in pounds per fathom (6 feet) by 4480.

Steel-wire rope. Use 7098 as the multiplier. The answers will be in pounds as before.

The square of half the circumference gives the breaking-strain of inferior plain laid rope in tons. This is a safe rule and easy to remember; but no cordage should be subjected to a strain of more than one third its estimated strength.

To ascertain the weight of common plain laid, tarred rope, multiply the square of the circumference by the length in fathoms, and divide by 4·24. The answer will be in pounds.

COREA, a monarchy in eastern Asia. The reigning monarch, Li-Hi, succeeded King Shoal Shing in 1864. The Government is an hereditary monarchy of an absolute type, modeled on that of China. No important step is taken in the affairs of Corea without the consent of the Chinese Government. The suzerainty of China has been acknowledged by Corea since the seventeenth century, and the dependent relation is stated in the Chinese-Corean frontier trade regulations. The revenue is principally paid in grain, and depends upon the state of the harvests. In 1886 the customs duties amounted to \$160,278, and they were estimated to exceed \$200,000 in 1887. There is a standing army of about 2,000 officers and men, constituting a royal guard, who are armed mostly with breech-loading rifles.

Area and Population.—The estimated area is 82,000 square miles, with a population of 10,528,937, of whom 5,312,323 are males, and 5,216,614 females. The capital, Seoul, has about 250,000 inhabitants. In 1887 there were about 3,700 foreign residents in Corea, consisting of 3,000 Japanese, 600 Chinese, and 100 others, mainly Germans, Americans, British, French, and Russians. The language of the country is intermediate between Mongolo-Tartar and Japanese.

Commerce.—The values of the imports and exports for three years were as follow:

YEAR.	Imports.	Exports.
1884.....	\$962,408	\$444,639
1885.....	1,651,562	889,023
1886.....	2,474,158	504,235

The principal imports in 1886 were cotton goods of the value of \$1,300,613; metals, chiefly copper, \$64,718; rice, \$586,548; silk, 25,818; dyes and colors, \$38,660; kerosene-oil, \$20,207. Rice is not usually an article of import, but the deficiency caused by a bad harvest in 1885 had to be supplied from abroad. The leading exports were cowhides, of the value of \$382,066, and beans, valued at \$51,733. The Government has a monopoly of the product of ginseng, which is exported overland to China to the value of \$400,000 annually. The chief agricultural products are rice, millet, beans, and jute. Japan controls the greater part of the foreign trade, and in 1886 imported

into Corea goods of the value of \$2,020,630; the exports from Corea to Japan during the same year were valued at \$486,041. Gold to the amount of \$500,000 was exported from Corea in 1886.

In 1886, 557 vessels, of 161,900 tons, entered the open ports of Jenchuan, Fusan, and Yuen-san from foreign countries; while 560 vessels, of 162,435 tons, cleared the ports.

The trade-returns for 1887 show a substantial improvement. The total value of imports at the open ports was \$2,815,441, in which cotton goods figured for \$1,884,497. The exports amounted to \$804,996. Cowhides usually constitute two thirds of the exports, but in this year the export of beans was greatest in value.

Foreign Relations.—The suzerain rights of China over Corea were suffered to fall into abeyance until the danger of a Russian annexation of the northern part of the kingdom, for the sake of having a winter port on the Pacific, excited alarm both in China and in Japan. The Chinese Government, on this account, determined on a more visible display of the relations of sovereign and vassal. The King of Corea, on the contrary, was filled with a desire to show his independence of China, being influenced in his decision by his ambitious queen, who was made the victim of allurements held out by intriguing foreign representatives in Seoul. Since the retirement of Herr von Möllendorff, the King's adviser in foreign affairs has been an American named Denny. During the past five years China has acted on many occasions as a suzerain power. When an insurrection occurred in Corea, which was the outcome of a plot to place the country under Russian protection, the capital was occupied by Chinese troops, and Corean statesmen were imprisoned and banished by the Chinese authorities. The King has often applied to the Chinese Government to perform acts that he would have no hesitation in deciding on for himself if he were independent. Yet, in his foreign relations, encouraged by foreign advisers and borne out by treaties made with the sanction of China, but in which no mention is made of Chinese suzerainty, he determined to act as an independent sovereign by sending envoys abroad. He accredited a minister to the United States and another to the principal European capitals. The former arrived at Washington toward the end of 1887, and, after a long delay, was formally received by the President. After investing his representatives with the rank of ministers plenipotentiary, and notifying the foreign representatives at Seoul, the King sent a memorial to Li Hung Chang, in which he acknowledged his vassalage and justified his course in giving his envoys plenipotentiary rank with the argument that high officials from a weak state will receive equal consideration with inferior ones from a powerful nation, adding the comment that Corea was nearly as large and strong as

Japan, the significance of which is found in the fact that Japan was formerly considered a vassal of China. Li Hung Chang objected to giving the Corean envoys the same rank as Chinese representatives abroad, but withdrew his objections on the conditions that the Corean envoys, on arriving at the foreign capitals, should report to the Chinese ministers, and be introduced by them to the foreign ministers of the countries to which they were accredited; that the Chinese minister should take precedence of the Corean minister on public occasions; and that the Corean ministers should consult with the Chinese ministers on all questions of importance. The King accepted these conditions. When the Corean envoy, Pak Ding-Yang, reached Washington, he was confronted with the difficulty, which Li Hung Chang had not taken into consideration in his arrangement, that a diplomatic representative of a vassal state, subject to the guidance of the envoy of the suzerain power, has no standing in Western diplomacy. He accordingly, perhaps not without the foreknowledge of his Government, obtained his reception at Washington without the intervention of the Chinese representative. The Chinese Foreign Office thereupon demanded explanations from the Corean King, and received the assurance that the envoy had exceeded his instructions.

Outbreak in Seoul.—A fanatical outbreak of the population of the capital against foreigners occurred in the early summer. It was caused by Chinamen who spread a report that American missionaries kidnapped Corean children and boiled them in order to obtain a preparation that is used in making photographs. The authorities in Seoul took steps to protect the missionaries before the disturbance occurred; but nine Corean officials who were suspected of being engaged in the sale of children to foreigners were seized by the mob and decapitated in the streets. In response to telegrams from the foreign representatives at Seoul, American, French, and Russian gun-boats at the port of Chemulpo, forty miles distant, sent landing parties, numbering about one hundred marines altogether, for the protection of their countrymen, and on the following morning a force arrived from a Japanese vessel.

COSTA RICA, one of the five Central American republics. The area is estimated at 19,980 square miles, and on Dec. 31, 1886, the population was 196,280.

Government.—The President of the republic since March 12, 1885, is Don Bernardo Soto, whose Cabinet is composed of the following ministers: Foreign Affairs, Don Miguel J. Jimenez; Finance and Commerce, Don Mauro Fernandez; Interior, Public Works, Justice, Public Worship, and Charity, Don José Astua Aguilar; and War, Don Rodolfo Soto. The Costa-Rican Minister at Washington is Don Pedro Pérez Zeledón. The United States Minister to the five Central American republics, resident at Guatemala, is H. O. Hall. The

Costa-Rican Consul-General at New York is Don José M. Muñoz; at San Francisco, Don Teodoro Lemmen Meyer. The American Consul at San José is J. Richard Wingfield.

Army.—The strength of the permanent army has been reduced to 1,000 men for 1888, to be increased to 5,000 in the event of civil disturbances, and, in case of war, it is to be raised numerically according to the exigencies of the case. The citizens capable of bearing arms are 23,838 between the ages of eighteen and thirty-five; 7,986 between thirty-six and fifty; and 8,414 over fifty, constituting a reserve of 40,238 men.

Finance.—The Government during the fiscal year 1887-'88 succeeded in paying off the entire consolidated home debt of \$3,000,000, while punctually paying the interest on the floating debt, and withdrawing and destroying \$25,000 of paper money quarterly. The budget for 1888-'89 estimates the outlay at \$3,480,922, and the income at \$3,494,743, the actual revenue collected in 1887-'88 having been \$3,447,880. The public indebtedness will stand on March 31, 1889, as follows: Five-per-cent. sterling debt, £2,000,000; paper money in circulation, \$844,943; due Union Bank, \$300,000; Consolidated Church and University funds, \$346,124. The payment of interest on these amounts will involve an outlay of \$758,150, and \$100,000 will be applied to the canceling of paper money. The latter will all be withdrawn and destroyed in eight years and a half. Toward the eventual paying off of the sterling debt the Government will use the 60,000 ordinary shares that will be turned over to it in conformity with the agreement relating to the construction of the railroad and conversion of the debt; furthermore, the proceeds of one third of 800,000 acres of land recently pledged to the River Plate Trust Company of London will be used for the same purpose. Meanwhile, the Union Bank has been authorized to issue bank-notes to the extent of four times its cash capital, under the proviso of maintaining a metallic reserve of one quarter of its note circulation.

Education.—In the normal section of the Superior Young Ladies' College at San José there were granted in 1888 forty scholarships, 20 of these being awarded, beside gratuitous instruction, a pension of \$15 a month and 20 instruction without pension. Congress, during the summer of 1888, voted \$300,000 for the building of public school-houses and the further development of gratuitous instruction.

Commerce.—The imports into Costa Rica in 1887 reached a total of \$5,601,225, England contributing \$1,771,466; Germany, \$815,729; France, \$612,076; Spain, \$32,750; Italy, \$4,608; Belgium, \$997; the United States, \$1,440,729; Colombia, \$798,605 (\$798,665 of the latter amount being coin); Ecuador, \$21,741; and Central America, \$101,644. On the other hand, the exports amounted to \$6,236,568, of which \$5,285,865 represented

coffee; \$669,544, bananas; \$75,113, hides; \$30,728, India-rubber; \$20,032, mother-of-pearl; \$68,972, sundry merchandise; and \$68,972, coin. The increase in exports over those of 1886 was \$3,010,756, chiefly due to the rise in coffee which brought as much as \$20 per quintal free on board. Of bananas the amount shipped exceeded that of the previous year by \$172,789.

The American trade was as follows:

FISCAL YEAR.	Import into the United States.	Domestic export to Costa Rica.
1888	\$1,608,979	\$1,064,549
1887	1,409,516	708,930
1886	898,045	548,215

Coffee-Planting.—The coffee of Costa Rica is highly appreciated both in the United States and in Europe, on account of its fine qualities and exquisite aroma; consequently, it commands a high price. Intending settlers on the coffee-lands of Costa Rica are warned not to buy the land necessary for a plantation wholly with borrowed capital, the interest rate on the spot being too high. They ought to possess money enough to pay cash for at least two thirds of the land. The net returns from a well-managed coffee-estate average about twelve per cent. per annum. The cost of a coffee-plantation depends in the first place on the quality of the soil, and next on whether it is situated in the vicinity of a large town. Cultivated coffee-land is worth from \$110 to \$335 an acre. The crops are very irregular; an abundant yield is the next year usually followed by a poor one; the third year it will prove tolerably good, and the fourth again an ample one. The newly planted shrubs will be in bearing at the end of four years. When the coffee-bean begins to form, plenty of rain is welcome, and but moderate sunshine. If blossoming be not soon succeeded by rains, the young berry will shrivel under a tropical sun. The annual coffee-product of Costa Rica varies between 10,000 and 15,000 tons.

Telegraphs.—The Government resolved in August to construct lines of telegraph to connect Liberia, Nicoya, and Santa Cruz with the system now in operation.

Railroads.—On October 16, the shareholders of Costa Rican railroads met in London. The lines acquired by purchase from the *concessionnaire*, Mr. Keith, are the one from Puerto Limon to Carillo, 71 miles, and one from Cartago to Alaguela, *via* San José. Work is proceeding rapidly on the line that is to connect Cartago with Reventazon, 8,400 workmen being employed. The Costa Rican system now in course of completion is all the more important as it will form another link of communication between the Atlantic and the Pacific. The company received a subsidy in the form of 800,000 acres of Government lands. The Government has ordered the building of a national wagon-road between Esparita and Bagaces.

Steamer Lines.—During the year, the Government made a contract with the Hamburg-American line, and another with the Spanish Transatlantic line, to touch once a month at Port Limon. The contracts with the Marqués de Campos and with Don Rafael Montúfar were forfeited for not complying with engagements in time.

Colonization.—A contract has been made by the Government with Eric Guido Gaertner to go to the United States and Europe and form colonizing companies for the settlement of desirable immigrants on the agricultural and mineral lands of the republic.

Exploration.—Another scientific exploration of the volcano Irazu was resolved upon by the Government during the spring, and H. Pittier, an American topographic engineer, was intrusted with the task. The exploration was made to the satisfaction of the Government, and valuable facts in connection with this mountain were ascertained. It was shown that its altitude is 1,411 metres, and not 1,508, as the first measurement had erroneously fixed it. The volcano has three craters, the most recently formed of which dates from the eruption of 1728. Mr. Pittier deplored the barbarous destruction of the magnificent forest that covered the flanks of this gigantic cone, and urges the Government to prevent the devastation from becoming complete.

Central American Union Movement.—On July 6 President Soto issued a decree advocating the assembling of a Central American diet for the purpose of planning the re-establishment of a union of the five republics, pending which Costa Rican citizenship was extended to the citizens of Guatemala, Honduras, Salvador, and Nicaragua. This initiative on the part of Costa Rica having met with a cordial response, the diet, which was composed of one representative from each of the five republics, met at San José on September 15, and Don Ricardo Jimenez, the representative of Costa Rica, was elected chairman.

American Arbitration.—On March 24 President Cleveland announced his decision on the disputed questions between Costa Rica and Nicaragua, in which he said:

The functions of arbitrator having been conferred upon the President of the United States by virtue of a treaty signed at the city of Guatemala on the 24th day of December, 1886, between the republics of Costa Rica and Nicaragua, whereby it was agreed that the question pending between the contracting governments in regard to the validity of their treaty of limits of the 15th day of April, 1858, should be submitted to the arbitration of the President of the United States of America; that, if the arbitrator's award should determine that the treaty was valid, the same award should also declare whether Costa Rica has the right of navigation of the river San Juan with vessels of war or of the revenue service, and other points. And the arbitrator, having delegated his powers to the Hon. George L. Rives, Assistant Secretary of State, who, after examining and considering the said allegations, documents, and answers, has made his report in writing thereon to the arbitrator.

Now, therefore, I, Grover Cleveland, President of

the United States of America, do hereby make the following decision and award:

1. The above-mentioned treaty of limits, signed on the 15th day of April, 1858, is valid.

2. The republic of Costa Rica under said treaty, and the stipulations contained in the sixth article thereof, has not the right of navigation of the river San Juan with vessels of war; but she may navigate said river with such vessels of the revenue service as may be related to and connected with her enjoyment of the "purposes of commerce" accorded to her in said article, or as may be necessary to the protection of said enjoyment.

Retaliation.—On September 17 the Secretary of the Treasury at Washington issued the following circular in regard to discriminating dues on Costa Rican vessels:

This department is informed through the Department of State that various lines of foreign and Costa Rican vessels plying between Costa Rica and New York, New Orleans, and other ports in the United States, as well as between Costa Rica and European ports, are allowed in Costa Rica a rebate of five per cent. of the customs duties and also certain privileges as to port charges. Such rebate is not conceded to vessels of the United States. The cargoes of Costa Rican vessels entering the United States, therefore, will be subjected to the discriminating duties levied by section 2,601, Revised Statutes, as embodied in the act of March 3, 1883. Officers of the customs will take action accordingly.

CREMATION, PROGRESS OF. The argument that Sir Henry Thompson published in 1874 (see "Annual Cyclopaedia" for 1876, p. 216) in favor of cremation as a method of disposing of the dead, although it was urged principally upon sanitary grounds, was shocking to a considerable part of the public. Many persons regarded it as a covert attack upon Christianity. Yet the thought was not new, for it had been broached in Italy in 1866; Gorini and Pollini had published the results of experiments in cremation in 1872, and a model furnace, illustrating the practicability of the process, had been shown by Prof. Brunetti, of Padua, at the Vienna Exhibition of 1873. The Cremation Society of England was formed, in 1879, for the purpose of obtaining information on the subject, and adopting the best method of performing the process as soon as that could be determined. Legal opinions having been obtained to the effect that this method of disposing of human bodies was not illegal, provided no nuisance was occasioned by it, an arrangement was made with one of the London cemeteries for the erection of a crematory on its grounds. The execution of this contract was forbidden by the Bishop of Rochester, and then an independent property was obtained at Woking, and a Gorini furnace was erected upon it, in which it was proved by experiment, in 1879, that a complete combustion of an adult human body could be effected in about an hour, without causing any smoke or effluvia, and with the reduction of every particle of organic matter to a pure, white, dry ash. Human cremations had already taken place abroad, by Brunetti in 1869 and 1870; at Dresden and Breslau (the latter in a Siemens apparatus, with gas) in 1874;

two at Milan, in close receptacles, with gas, in 1876; and two in 1877. The Cremation Society of Milan, established in 1876, and having now two Gorini furnaces, had, on the 31st of December, 1886, cremated 463 bodies. Similar buildings to that of the Milan Society, but on a smaller scale, have been constructed at Lodi, Cremona, Brescia, Padua, Varese, and in the Campo Varano Cemetery at Rome, at the last of which 123 cremations were performed between April, 1883, and the 31st of December, 1886. The whole number of cremations in Italy till the last date was 787. The only place in Germany where the process is regularly performed is Gotha, where the first human body was reduced in a building constructed, with permission of the Government, in December, 1878, and 473 reductions had taken place on the 31st of October, 1887. Cremation societies have been formed in Denmark, Belgium, Switzerland, Holland, Sweden, and Norway, and at several places in the United States. A bill to establish and regulate cremation was approved by the Legislative Council of New South Wales in 1886, but failed to pass the House of Assembly. A spacious crematory at Père la Chaise, Paris, was first used on the 22d of October, 1887. The English society's crematory went into operation in 1884, after a judgment had been obtained from Mr. Justice Stephen that this mode of disposing of the dead is legal, provided no nuisance is incurred; and thirteen cremations had taken place in it at the end of November, 1887. According to Sir Henry Thompson, "the complete incineration is accomplished" (in the Gorini furnace) "without escape of smoke or other offensive product, and with extreme ease and rapidity. The ashes, which weigh about three pounds, are placed at the disposal of the friends, and are removed; or, if desired, they may be restored at once to the soil, being now perfectly innocuous, if that mode of dealing with them is preferred. One friend of the deceased is always invited to be present." To prevent the process being abused by people desiring to conceal evidences of poisoning, it is insisted that, in all cases where the cause of disease is in doubt, an autopsy shall be made. If this is objected to by the family of the deceased, the doubtful case is avoided. The friends of cremation profess to desire that, in all legislation that may be sought authorizing the process, the most effective safeguards that can be devised shall be provided against an irregular use of it.

A congress of friends of cremation was held in Vienna, in September, at which reports were made showing that about fifty furnaces had been erected in different countries, of which twenty were in Italy, one in Germany, one in England, one in Switzerland, one in France, and the rest in the United States. According to a paper read by Mr. O. K. Remington in the American Association (Cleveland meeting,

1888), crematories are in operation near nine cities of the Union, viz.: Washington, Lancaster, Pittsburg, and Philadelphia, Pa.; Brooklyn, and Buffalo, N. Y.; Detroit, Mich.; St. Louis, Mo.; Los Angeles, Cal.; and in many other places cremation societies have been established for a considerable time. The crematory at Buffalo is supplied with a Venini furnace, by which a body can be reduced, without offensive results, in an hour and a half or less. The apparatus was inspected with much interest by members of the American Association in 1886; and among the results of the visit were the formation of several cremation societies and the erection, in one or two instances, of crematories. The religious prejudices that at first existed against this method seem to be passing away. The Bishop of Manchester, in a sermon delivered in April, 1888, said that if there is anything in Paul's doctrine of the resurrection bearing upon the subject, he thought that "it indicates that of the two modes proposed, cremation is the more Christian."

CUBA, an island in the West Indies, belonging to Spain. (For statistics of area, population, etc., see "Annual Cyclopædia" for 1888.)

Army.—The Commander-in-Chief and Captain-General of the island is Don Sabas Marin. The strength of the Spanish forces in Cuba in 1888 was 20,000. The principal features of the proposed military reforms in Spain and her colonies comprise compulsory service for every born or naturalized Spaniard who has attained twenty years of age. There is to be no exemption, either in time of peace or in war, except for physical infirmity. The duration of service will be twelve years in the peninsula and eight in the colonies. Three years will be passed in actual service, four in the first reserve, and five in the second reserve, the last class being only liable to be called out one month in each year in time of peace. No pecuniary redemption will be permitted, except for an exchange from colonial to home service.

Finance.—The Cuban budget for 1888-'89 estimates the outlay at \$25,614,494, and the income at \$25,622,968. The actual receipts in 1886-'87 prove to have been \$24,852,489 instead of \$25,994,725 as had been estimated, while the actual expenses were \$26,444,641 instead of \$25,959,785 as estimated. During the first six months of the fiscal year 1887-'88 the actual receipts were \$9,959,126 as compared with the estimated, \$10,389,203; on the other hand, the expenses did not exceed \$8,904,751 instead of reaching the estimate, \$11,878,648.

In October proposals were made to the Colonial Minister of Spain for a conversion of the bonded debt of the island and its floating indebtedness, the whole aggregating the equivalent of £25,000,000. These propositions came simultaneously from Spanish and foreign banking institutions. The conversion would chiefly bear on the 620,000,000 francs of the loan of 1886, the interest and sinking-fund charge of

which would be reduced from 6½ per cent. to 4½ per cent. yearly, while the time the new bonds would have to run would be extended to seventy-five years instead of the present fifty years.

In June, 1888, the excise duty on fresh meat had produced since its establishment, three years previously, \$118,187 to municipalities, and \$899,138 to the treasury.

Railroads.—During the spring important sums were subscribed at Puerto Principe for the construction of a narrow-gauge railroad from that city to Santa Cruz del Sur. Simultaneously it was decided to extend the Caibarien and Sancti Spiritus railroad to Santa Clara, with a new branch line from Placetas to Hernandez.

Telegraphs.—In August a cable was laid between Cuba and Hayti, connecting Cuba with Puerto Plata, Santo Domingo, Curaçoa, and Venezuela.

Telephones.—By a decree of May 12, the Queen-Regent of Spain set forth the conditions upon which telephone enterprise may be undertaken in Cuba, Porto Rico, and the Philippine archipelago. The state is to receive at least six per cent. of the gross receipts. The concessions are to last twenty years, at the end of which period everything passes to the state. The telephones, as regards taxes, way-leaves, and hours of service, are to be on the same footing as state departments. The *cessionnaires* will have to guarantee the service, and erect offices open to the public. The maximum charge for places situated within municipal boundaries is \$102. This charge is increased to \$204 for flats, and \$338 for hotels, clubs, etc. An additional \$1.50 may be charged for every 100 metres outside the municipal boundaries.

New Ports.—The port of Mariel was made a port of entry in March; it is believed that this port will have a most prosperous future. A railway will eventually connect it with the Western Railroad *via* Guanajay. Asphaltum is found in the neighborhood of Mariel, and it is expected that a good export trade can be established therein to the United States. Another new port soon to be made a port of entry is San Cayetano, near the town of Esperanza.

Commerce.—The American trade with Cuba is shown in the following table:

FISCAL YEAR.	Import from Cuba into the United States.	Domestic export from the United States to Cuba.	Total trade.
1883.....	\$65,544,564	\$14,567,918	\$80,112,482
1884.....	57,181,497	10,562,880	67,744,377
1885.....	42,806,098	8,719,195	51,525,293
1886.....	51,110,780	10,090,879	61,181,659
1887.....	49,515,434	10,188,930	59,654,364
1888.....	49,819,067	9,724,124	59,543,191

Sugar and Molasses Production.—The following tabular statement shows the amounts of sugar and molasses produced in the island during the last decade:

YEARS.	Sugar.	Molasses.	Together.
	Tons.	Tons.	Tons.
1879.....	570,225	146,841	716,566
1880.....	580,189	114,328	644,432
1881.....	698,764	96,747	790,511
1882.....	595,587	134,324	737,061
1883.....	460,397	100,392	560,699
1884.....	558,987	115,552	674,539
1885.....	681,967	146,964	778,951
1886.....	781,728	187,064	918,787
1887.....	646,578	158,015	799,598
1888.....	628,017	148,577	771,594
Total.....	6,043,684	1,840,019	7,883,708

On comparing the total amount of sugar and molasses produced during the quinquennium 1879-'83 with that of the last quinquennium, 1884-'88, an increase of 504,225 tons will be found to result in the latter, or about 15 per cent.

During crop-time, in 1888, field-hands were scarce, and commanded without difficulty \$20 wages a month and found.

Average prices paid for sugar at Havana, in rials, gold:

GRADES.	Crop of 1888.	Crop of 1887.
Special sorts, No. 12, suitable for Spain.	6½	5½
Clayed, No. 12, current quality.....	6-8½	5½
Centrifugal, polarization, §§.....	5-5½	4½
Muscovadoes, polarization, §§.....	4-60	3-½
Molasses sugara, polarization, §§.....	4-68½	3-½

The cheapened production through improved processes and perfected machinery, together with the higher prices realized, materially assisted in placing sugar-planting in Cuba once more on a basis of moderate prosperity, despite the still heavy taxes and the abolition of the "patronato."

Mining.—According to the official statistics, the mineral production of Cuba during the year 1886 was 2,066 tons of asphaltum, 112,755 tons of iron-ore, 40 tons of manganese-ore, and 45 tons of copper-ore. The exports during the same year were 112,755 tons of iron-ore to the United States, 1,403 tons of asphaltum to the United States and England, 45 tons of copper-ore to England, and 40 tons of manganese to the United States.

In May, 1888, a royal order was published dividing Cuba into two mineral districts, the eastern district being composed of the provinces of Santiago de Cuba and Puerto Principe, and the western district of the provinces of Havana, Santa Clara, Matanzas, and Pinar del Rio, each district to be placed in charge of a special mine-inspector. Among the mines for which at the same time titles were granted by the Government were two quicksilver-mines, covering an area of 27 hectares, and one for antimony, covering 60 hectares. The Government declared it was willing to offer all the advantages possible with a view to developing the country, but that there would be a difficulty from insufficiency of labor for working on a large scale—a difficulty which, however, could easily be surmounted by importing miners from Spain or elsewhere. In June an American

company acquired in the province of Santiago de Cuba the ownership of several manganese-mines. The contract provided for the payment of \$1 United States gold for each ton of ore exported, the number of tons to be exported not to exceed 21,000 yearly, and the export dues to be paid quarterly in the sum of \$5,250, whether the maximum quantity be exported or not. The copper-mines of San Fernando and the Santa Rosa Company at Santa Clara exported some copper through the port of Cienfuegos about the same time; they begin to be worked on a large scale.

The Cuban Bessemer Iron Ore range is of considerable interest in connection with the American Juragua Iron Company, the joint property of the Bethlehem Iron Company and the Pennsylvania Steel Company. In a recently published description of the locality the Sigua or Arroyo de la Plata mines are specially referred to. One of the six Sigua properties is described as showing outcrops varying from 150 to 450 feet in width, with a very large amount of ore in sight. They are located about four miles back of the Carribean Sea, about twenty-two miles by road from the Bay of Santiago de Cuba. The Government employs all means in its power to encourage and promote the mining industry in the island of Cuba. Mining companies are, by a special law, exempted for a period of twenty years from all taxation, and for a period of seven years from import duties on all materials, machinery, etc., for use in the construction and operation of mining works. These exemptions cover railway, harbor, and all other works belonging to mining companies. Labor is easily obtainable at the rate of eighty cents a day, and under proper management is very efficient. The climate in the hills where these mines are situated is healthful.

Up to the middle of June, 1888, there had been registered 800 mines, to work which a concession had been applied for in the province of Santiago de Cuba, namely: iron, 108; manganese, 87; copper, 151; silver, 2; gold, 8; sulphate of zinc, 8; lead, 1; antimony, 1; and coal, 1. One of the gold-mines is near the village of Jiguaní, on the bank of the river of the same name. A fair quantity of gold is said to be in the bed of the stream, and a joint-stock company was organized to work this mine. Favorable accounts were also received from the San Anastasio gold-mine at Guaraobulla, near Placetas, Santa Clara.

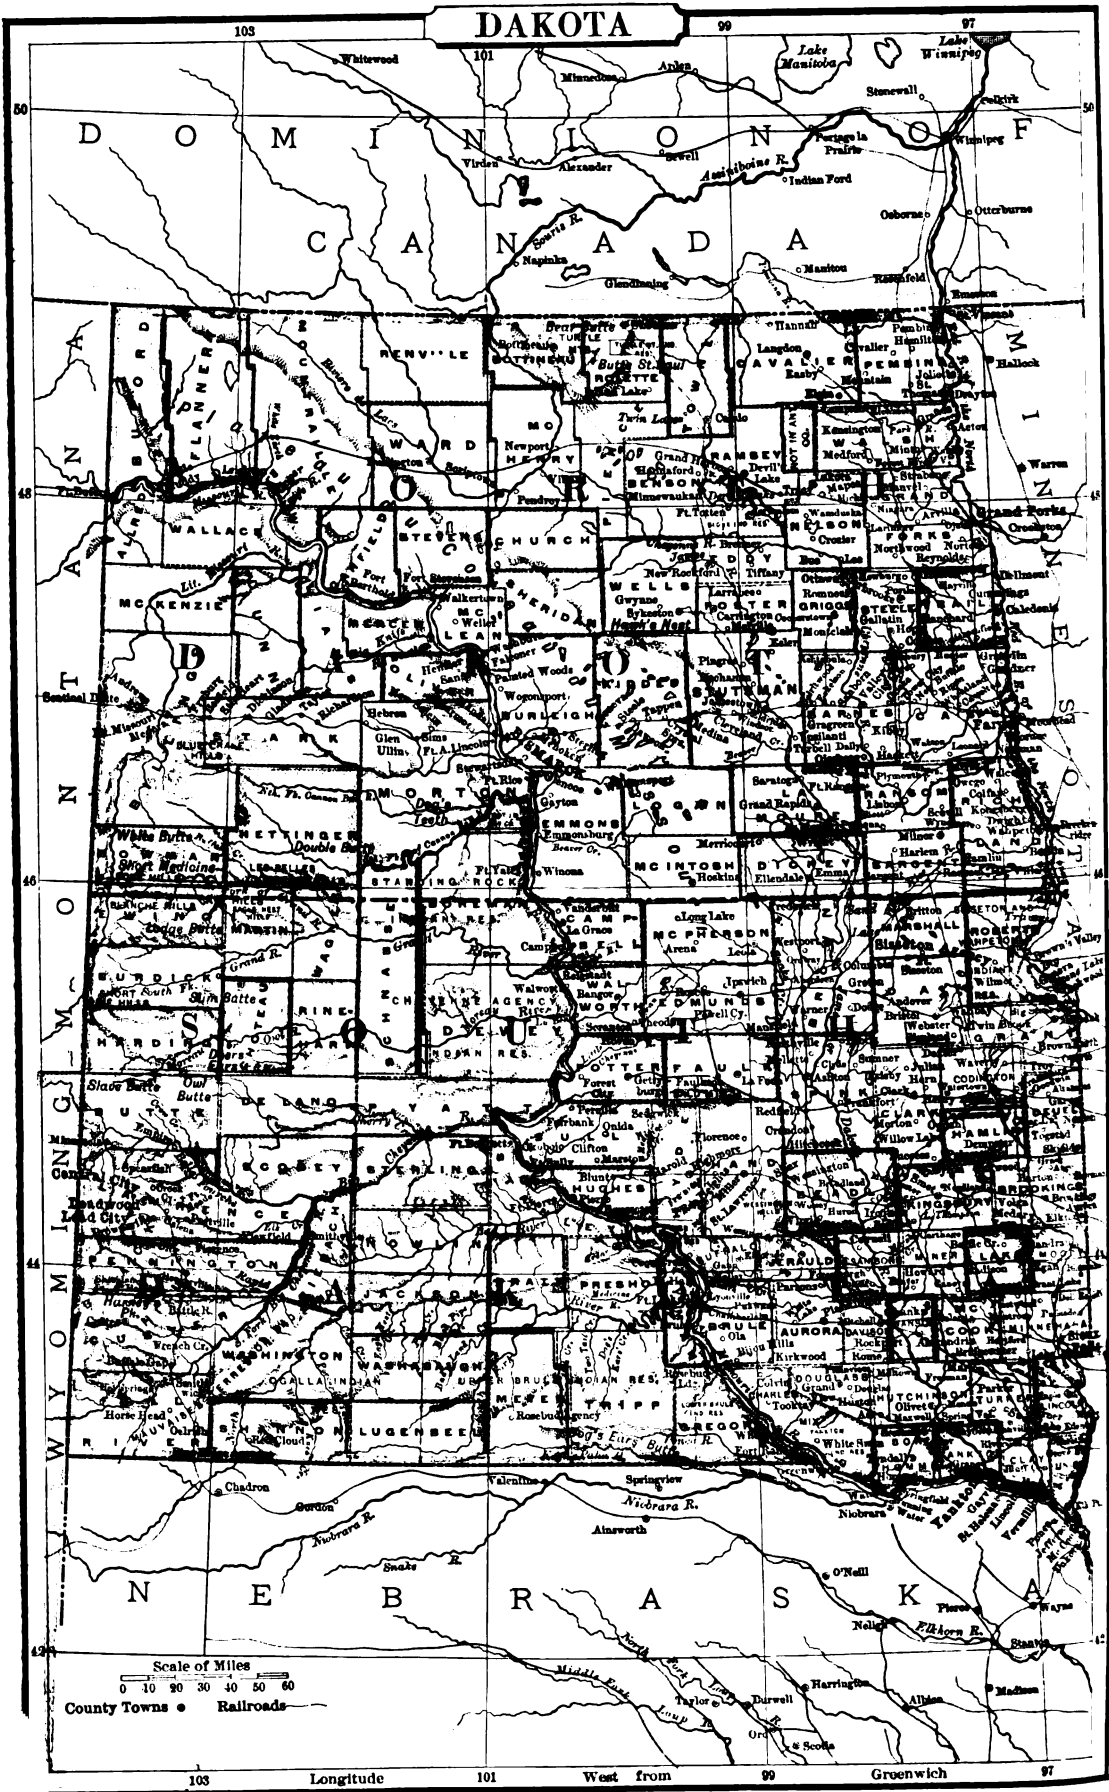

New Textile Fiber.—Don Leopoldo del Castillo, of Puerto Principe, has introduced a new fiber, that of the quimbombó plant, indigenous to the locality and island, growing spontaneously in all sorts of soil throughout the year, and furnishing a soft, white fiber of great strength, considered superior to flax. Good progress has also been made with ramie culture at Guines.

General Condition.—The stringent measures taken in August, 1887, by Captain-General

Marín for the purpose of purifying the customs service at Havana, have produced tangible results in the shape of larger revenue from that source ever since. In April, brigandage and kidnaping had assumed such proportions that the Captain-General issued a decree declaring martial law in five provinces containing one hundred cities, towns, and villages. In one instance a wealthy merchant, Señor Galindez, was kidnaped and not released till his ransom of \$40,000 had been paid. Incendiary fires on the sugar-estates, leading to heavy losses from the destruction of standing canes, were also of frequent occurrence during a season of drought in the spring. The measures alluded to, which were adopted by the Captain-General to suppress crime throughout Cuba, proved most beneficial in their results. The robber bands were broken up completely, and fugitive members were captured daily, among others, one of the band that had carried off Señor Galindez. Among other inflections the island was subject to, Havana was visited by small-pox, of which there were 2,000 cases in December, 1887, and January and February, 1888, 580 proving fatal; later it spread to Cienfuegos and Manzanillo with less violence. The yellow fever made its appearance in September at Santo Espiritu and Paredes, decimating chiefly the Spanish troops stationed in those localities, with a few cases at Santiago. On September 4 and 5 a most destructive cyclone swept the island. Its disastrous effects were felt the whole length of Cuba. Its greatest violence spent itself in the province of Santa Clara. This cyclone was as disastrous as that which occurred in 1883. The destruction of property on shore and along the coast in harbors and bights was counted by millions, the loss of life at the same time reaching 1,000. The Captain-General left immediately on a tour of inspection in the devastated districts, but after visiting Matanzas and Cárdenas was suddenly recalled to Havana by the alarm felt in the latter city on account of the numerous strikes occurring in various trades, the movement being the result of the cigarmakers' strike. The authorities were resolved to take the severest measures to prevent a disturbance; but good order prevailed, the cigarmakers' strike, having kept at one time 8,000 operators out of employment, ending early in October. At 4 A. M., on July 2, a severe shock of earthquake was experienced at Baracoa and vicinity; the damage to property was considerable, but there was no loss of life. In September, in the district of Roque springs that had been dry for a long time were again flowing, partially submerging some estates, their reappearance exciting general alarm throughout the district.

American Consular Service.—The Consul-General at Havana is Ramon O. Williams; the Consul at Matanzas, Frank H. Pierce; at Santiago, Otto E. Reimer; at Cienfuegos, Henry A. Ehninger.

DAKOTA

Modus Vivendi Treaty.—On Jan. 12, 1888, the Madrid Government "Gaceta" published the text of the agreement between Spain and the United States for the prolongation until June 30 of the suspension of differential dues upon vessels and cargoes from either, in connection with the colonial trade. Dating from July, the arrangement was prolonged pending the conclusion of a more ample treaty, the agreement to be liable to termination on two months' notice being given by either side.

Canada and Cuba.—Toward the middle of November a report was received from Ottawa, Ontario, that Sir Charles Tupper was actively engaged in negotiating a treaty of commerce between the Dominion of Canada and Spain, Sir Charles proposing to secure for Canadian products the advantages in Cuba and Porto Rico that were granted to the United States by the treaty rejected in 1885.

It was agreed in that treaty, negotiated by President Arthur in 1884, that the United States should admit duty free or with certain scheduled duties all the so scheduled articles that were the products of the Spanish Isles, Cuba, and Porto Rico; and that Spain should grant similar privileges in those isles to all products of the United States.

Among the articles to be admitted free of duty into the United States were horses, cocoa,

coffee, fresh fruits, hemp, flax, hides, palm-oil, sugars not above No. 16 Dutch standard, molasses, woods, sponges, guano, and coin. On cigars and cigarettes the duty was to be 12½ per cent. ad valorem; fine tobacco, with stems, 37 cents a pound; without stems 50 cents a pound; other tobacco, 17½ cents a pound; snuff, 25 cents a pound; tobacco manufactured, 20 cents a pound; not manufactured, 15 cents a pound.

Among the articles to be admitted free of duty into the Spanish Isles from the United States were beer, fresh meats, bacon, fish, grain and other cereals except rice, flour of cereals except rice, lard, cheese, cattle, sheep and hogs, clay, tiles, bricks, minerals, useful tools, agricultural implements, crude petroleum, tar, pitch, resin, coal, seeds, building-stones, ice, cast-iron in pigs, cast-iron in tubes, malleable iron and steel, wire, nails, screws, wrought-iron tubes, substances used in chemical industries, drugs.

The report alluded to added that hopes were entertained in Canada of building up an extensive trade in the Spanish West Indies for Canadian products. The Canadian Government had, indeed, been engaged for a year or two in trying to secure the West India trade for that country, but till then with seemingly little success.

D

DAKOTA. Territorial Government.—The following were the Territorial officers during the year: Governor, Louis K. Church; Secretary, M. L. McCormack; Treasurer, — Lawler; Auditor, James A. Ward; Chairman of the Board of Education, Eugene A. Dye; Attorney-General, O. F. Templeton, succeeded by T. O. Skinner; Commissioner of Immigration, P. F. McClure; Chief Justice of the Supreme Court, Bartlett Tripp; Associate Justices, Charles M. Thomas, William H. Francis, succeeded by Roderick Rose, William B. McConnell, Cornelius S. Palmer, succeeded by John W. Garland, James Spencer. By act of Congress of this year two new judicial districts were created. Over these the President late in the year appointed Attorney-General Templeton and Louis W. Crofoot as associate justices.

Finance.—The Territorial debt has not been increased during the year, the treasury being more than able to meet demands upon it. The total receipts for the year ending September 30 were \$532,766.51, while the expenditures for the same time were but \$488,109.21. The annual interest on the debt is \$56,026.50.

Population.—According to estimates of the Commissioner of Immigration, the population of the Territory on the last day of June, 1887, was 568,477, and at the same date this year 620,823, a gain of 62,346. This estimate does

not include Indians or Government officials and others upon the reservations, who would increase the total to 700,000. The proportion of the foreign-born element is about one in three of the population. A majority of the settlers of foreign nativity are Scandinavians; next come Germans, Canadians, Irish, and Russians in the order mentioned. There is scarcely a foreign country unrepresented among the inhabitants of the Territory.

The total of lands newly filed on and purchased by immigrants for settlement for the year ending June 30, 1888, approximates 2,500,000 acres, or 3,900 square miles, an area twice that of the State of Delaware. There still remains an area of over 22,000,000 acres open for settlers, outside of the 27,000,000 acres now comprised in the Indian reservations.

Assessments.—The total value of property in the Territory, as shown by the assessment roll for 1888 amounts to \$161,420,974.30, an increase of nearly \$4,500,000 over 1887. As 4,800 miles of railroad and other property in the Territory belonging to railroads, with a valuation of over \$40,000,000, is not assessed and forms no part of this valuation (railroads being taxed upon their gross earnings), and as property is usually assessed at from half to two thirds of its actual value, it is a moderate estimate to place the actual property value of the

Territory at \$820,000,000. The following table shows some details of the assessment:

PROPERTY ASSESSED.	Number.	Value.
Acres of land	28,692,816	\$91,875,729
Town lots		26,125,555
Horses	263,410	12,120,246
Mules	16,067	822,773
Cattle	597,893	7,634,548
Sheep	152,896	207,790
Swine	174,098	446,811
Property invested in merchandises.		6,571,007
Carriages, etc		2,350,964

The total tax levy for the year was 8 mills on the dollar.

Education.—There are two systems of common schools in the Territory. Fifteen counties are operated under a district system, by which the people retain the burden of administration in their own hands or delegate it to a school board of three members in each school district, who are chosen annually. Seventy-one counties are operated under a township system, in which the chief authority is vested in a township school board made up of directors, one from each school district of the township, elected annually by the people. Besides these, the city and graded schools are operated under general and special laws, while the various State institutions for higher and special education are operated under special acts, and, as a rule, are independent of the general system of schools.

The University of Dakota, at Vermilion, has 20 instructors, and an attendance of more than 300 pupils. During the year a dormitory for young women and an east wing to the main building were constructed, at a cost of \$25,000. The University of North Dakota, of more recent origin, has instructed 98 pupils during the past school year, an increase of 23 over the preceding year. A dormitory building, for which the Legislature of 1887 appropriated \$20,000, was completed and occupied early in 1888. The university buildings sustained considerable damage through a storm, in June, 1887. At the Agricultural College, in Brookings, 228 pupils were enrolled during the school year, and in June the first class was graduated. A dormitory for women was erected during the year out of the appropriation by the last Legislature for that purpose. The Normal School at Madison had about 150 students during the year, and that at Spearfish 104. Appropriations by the last Legislature enabled additions to be made to the school-buildings at both of these institutions. The Legislature also made an appropriation for paying the tuition of classes of teachers or intending teachers in several of the denominational and private schools of the Territory, thus enabling many teachers to improve themselves without the expense of a long journey. The law provided that ten of these institutions may be designated by the Territorial board of education, and each may have a class of from ten to twenty-five members, whose tuition will be paid by the Territory upon or-

der from the Territorial board, at the rate of \$1 a week. During the year eight institutions have had classes on these conditions. A total sum of \$3,906.22 has been paid these schools for this work.

The School of Mines, at Rapid City, created by the Legislature of 1885, completed its first year in June, having enrolled 48 students. The corps of instruction embraces four professors and two assistants. This school is also charged with the duty of surveying and investigating the mineral resources of the Territory, especially in the Black Hills, and during the year it published a valuable report upon the tin-deposits in that region.

Charities and Prisons.—The Hospital for the Insane at Yankton secured an appropriation of \$92,500 from the last Legislature, for the purpose of enlarging its capacity by the construction of two additional wings to the main building. But charges of irregularity were made against the trustees of the institution; the Governor, in September, 1887, after an examination by the Public Examiner, suspended from their duties a majority of the members of the board, and, after further examinations, on November 2 removed the members so suspended for official misconduct and neglect of duty. As the remainder of the board then resigned, the Governor appointed an entirely new board of five members, who proceeded to construct the additions. In consequence of this difficulty the work was scarcely completed at the close of the present year. The removed members of the Board of Trustees took legal proceedings to test the power of the Governor to make such removals, but the decision was adverse to them. The number of patients at this hospital during the year was nearly 200. At the North Dakota Hospital there were 178, an increase of 31 over the previous year. At the School for Deaf Mutes, at Sioux Falls, there were 44 pupils during the year, which is the largest attendance in its history. A workshop and other buildings have been constructed.

The Penitentiary at Sioux Falls contained 92 convicts on July 1, an increase of 10 in one year. The total number confined during the year was 128. Since December, 1882, the date of its opening, the institution has received 325 prisoners, and released 233. At the Bismarck Penitentiary there were about 50 prisoners on July 1. Extensions have been made to the prison-building by the construction of a south wing. By an act of the last Legislature \$30,000 was appropriated for buildings for a reform school at Plankinton, and this sum was expended in constructing and furnishing a building of four stories, with out-buildings, which were ready for occupancy in August. Up to October 1, however, no persons had been placed under the care of the institution.

Railroad Construction.—The total railroad mileage in the Territory on January 1 was 4,207 miles. There were completed, or to be completed during the building season of 1888, the

following lines: From Watertown to Huron, 73 miles, on the Duluth, Watertown and Pacific Railway; from Willmar, Minn., to Sioux Falls, 23 miles, on the Duluth and Willmar Railway; from Cherokee, Iowa, to Sioux Falls, 16 miles, on the Illinois Central Railway; and 15 miles on the St. Paul, Minneapolis and Manitoba Railway, making a total of 4,333 miles. Activity in railroad construction was not so marked as in the year immediately preceding.

Agriculture.—Farming is the chief industry of the Territory, and the growing of wheat has been the leading occupation. Wheat is grown at a minimum cost, which varies from 24 cents a bushel on the bonanza farms of the Red River valley (where the large area tilled and the employment of special machinery result in more than the usual economy) to 36 cents a bushel, the average cost on farms of ordinary size.

The following statistics for 1887 show the production and acreage of wheat and other cereals for that season (one county excepted):

CEREALS.	Acres.	Bushels.
Wheat.....	8,818,754	62,559,499
Corn.....	608,807	24,511,738
Oats.....	1,172,280	48,267,478
Rye.....	17,559	316,568
Barley.....	235,155	6,400,568
Buckwheat.....	5,749	97,230
Flax.....	412,741	8,910,844

Indians.—There has been no serious disturbances at the various Indian agencies during the year, and the Indians were reported to be making progress in farming in nearly every case. The Sisseton agency reported about 1,500 Indians, the Cheyenne River agency 2,925, the Crow Creek and Lower Brulé about 2,500, the Pine Ridge 5,609, the Standing Rock 4,885, the Rosebud 7,404, and the Yankton 1,837. Two other agencies, the Fort Berthold and Devil's Lake, have about 4,000.

An act of Congress was passed in May designed to meet the wishes of Dakota citizens for diminishing the size of the great Sioux reservation and opening the region to settlers. By the terms of the act, about half of the reservation, or over 10,000,000 acres, was to be purchased by the Government at fifty cents an acre, and the remaining portion was to be divided into five distinct reservations. A commission was created to secure the assent of the Indians to this proposal, and the President appointed R. H. Pratt, Judge Wright, and William Cleveland, as such commissioners. During August, September, and October, conferences were held by these commissioners with the various Sioux tribes at the agencies; but it was found impossible to secure the assent of three fourths of the whole tribe, which, by the terms of the act, was necessary to make it operative. In fact, very few of the Indians assented to its provision, the great majority demanding \$1.25 an acre for their land. Some of the Sioux chiefs went to Washington, and

there held conferences with the Secretary of the Interior, but no agreement was reached.

Local Option.—The constitutionality of the local-option law of 1887 was passed upon by the Territorial Supreme Court in February, and its validity as a police regulation was sustained. The court says that, as the States under their Constitutions are considered to have power to pass such laws, so "the organic act of the Territory is so far a constitution in character, and the temporary government thereby created is so far sovereign that it has the power to enact any and all laws in the nature of police regulations not in conflict with the statutes and Constitution of the United States; that police regulations are necessarily local, and could not well be exercised by Congress over all its outlying territory; that it intended to, and must necessarily have placed somewhere outside of Congress, but subject to its ultimate control, the power of regulating the affairs of municipal concern."

Another act of the same year, authorizing township bonds in payment for the construction of public artesian wells, was declared invalid, by the same court, later in the year.

Taxation of Railroads.—The Governor says, in his annual report: "In 1879 the Legislature passed an act providing for the taxing of railroads under the gross-earnings system. I quote the following from section 24: 'The percentage of gross earnings hereinbefore specified to be paid shall be in lieu of all other taxation of the road-bed, etc., used in or incident to the operation of such railroad. All property of railroads not above enumerated, subject to taxation, shall be treated in all respects, in regard to assessment, equalization, and taxation, the same as similar property belonging to individuals, whether said lands are received from the General Government or from other sources.' In 1883 the Legislature passed another act providing for the collection of taxes on railroad property. The following is a part of section 1 of said chapter: 'In lieu of any and all other taxes upon any railroads, except railroads operated by horse-power, within this Territory, or upon the equipment, appurtenances, or appendages thereof, or upon any other property situated in this Territory belonging to the corporation owning or operating such railroads, or upon the capital stock or business transaction of such railroad company, there shall hereafter be paid into the treasury of this Territory a percentage of all the gross earnings of the corporation,' etc. As the law stood prior to 1883, it is plain that the Legislature intended to exempt from the ordinary and usual method of taxation only such property as was actually used in or necessarily incident to the operation of the roads. Whether said chapter goes further and exempts more property than is used in and incident to the operation of the roads, is a disputed question between the officers of the Territory and the railroad companies. In 1880 the officers of

the county of Traill assessed and levied taxes for that year upon lands granted to the Northern Pacific Railroad Company for the purpose of aiding in the construction of said road, said lands not being a part of the road-bed or any way used for railway purposes. The county treasurer proceeded to advertise said lands for sale for non-payment of taxes. An application was made to the Territorial District Court to enjoin the collection of such taxes. On appeal, the Supreme Court of the Territory gave judgment for the defendant. Appeal was taken to the Supreme Court of the United States, and the decree of the Supreme Court of the Territory of Dakota was reversed, with directions to cause a decree to be entered perpetually enjoining the treasurer of Traill County from any further proceeding to collect the taxes, the court holding that the provisions in the act of July 17, 1870—that the lands granted to the Northern Pacific Railroad Company by the act of July 2, 1864, shall not be conveyed to the company or any party entitled thereto 'until there shall be first paid into the Treasury of the United States the cost of surveying, selecting, and conveying the same by the company to party in interest'—exempt these lands from State or Territorial taxation until such payment is made into the Treasury. That 'the Northern Pacific Railroad Company has acquired no equitable interest in the lands so granted to it by reason of completing its road and thus earning the granted lands which are subject to State or Territorial taxation before such payment is made into the Treasury of the United States.' The doctrine promulgated by the Supreme Court in this case was set aside by act of Congress approved July 10, 1886. Accordingly, the Territorial officers caused the surveyed lands belonging to the Northern Pacific Railroad Company to be assessed both in 1887 and 1888. The company has not paid the taxes, and the validity of the tax has not been passed upon by the courts."

Another question has been in dispute as to the validity of a gross-earnings tax. The same company, having rendered its returns of gross earnings for 1886, was taxed by the Territory thereon \$76,000, half of which became payable on or before Feb. 15, 1887, and the other half on or before Aug. 15, 1887. After paying the first installment, the company refused to pay that which became due August 15, and, for the purpose of satisfying the tax, the Territorial treasurer distrained a large amount of rolling-stock. The corporation brought suit to prevent the sale, and obtained from the District Court a permanent injunction restraining it. The company in its complaint showed that the tax upon its earnings, local within the Territory, would not for the year exceed \$12,000, and the suit was maintained on the grounds that the tax upon all the earnings not local within the Territory was a tax upon interstate commerce and void, and the company having already paid more than the whole tax on local

earnings for the year, no more could be collected. The case was taken to the Supreme Court of the Territory, and the decision of the District Court affirmed.

Section 1925 of the Revised Statutes of the United States provides as follows: "In addition to the restrictions upon the legislative power of the Territories contained in the preceding chapter, section 1925, the legislative assemblies of Colorado, Dakota, and Wyoming shall not pass any law impairing the rights of private property or make any discrimination in taxing different kinds of property, but all property subject to taxation shall be taxed in proportion to its value." The question then arises as to whether the gross-earnings law is not in conflict with this section of the Revised Statutes. This question was not raised in the late suit to enforce collections under the gross-earnings law. The Northern Pacific Railroad Company, during 1888, paid about \$10,000 tax under the gross-earnings law. As under its charter the road-bed of the Northern Pacific Railroad Company and all necessary property appurtenant thereto are exempt from taxation, it follows, if the gross-earnings law is invalid, that the company will escape all taxation.

Division and Statehood.—During the year there was much agitation and discussion throughout the Territory on these two subjects, in the course of which the various bills pending before Congress were thoroughly canvassed. On February 29 an address was issued to the people by the Division and Statehood Committee, appointed by the Huron Convention of July, 1887, urging the people, in making their political nominations, to select only pronounced divisionists, and exhorting the press to maintain an earnest advocacy of the division cause. Later in the year this committee called a general convention, to meet at Huron on July 10 and 11, in the interest of division, and, following this on the 12th, separate conventions of the various professions and of farmers and business men for the same purpose. These conventions met and adopted resolutions favoring division. The various party conventions also generally adopted division resolutions, and nominated candidates favorable to division. The result of the general election in November rendered an early admission of the Territory probable, and consequently gave renewed vigor to discussion of the division question. North Dakota had hitherto been considered hostile to the plan of admission as two States; but with the approach of the actual fact of admission there seems to have been a weakening of this sentiment. While it had hitherto been scarcely possible to bring together a convention of divisionists in North Dakota, such a meeting was held at Watertown on December 5. This convention resolved:

That we favor the division of North Dakota Territory on the seventh standard parallel, and the immediate admission of the northern portion into the Union of States.

That we are emphatically in favor of the name of North Dakota for the proposed new State.

That the Fiftieth Congress should provide for the admission of North Dakota.

That in case the Fiftieth Congress fails to provide for the admission of North Dakota as a State, we earnestly request the President-elect to call a special session of the Fifty-first Congress for that purpose.

That the Eighteenth Legislative Assembly of North Dakota Territory is urged to provide at the earliest practicable moment after its meeting in January, 1889, for a constitutional convention for North Dakota.

That South Dakota, Montana, and Washington are respectfully invited to co-operate with North Dakota in this movement for admission.

Political.—On June 27 the Prohibitionists of the Territory met in convention at Redfield, and nominated S. H. Crammer for delegate to Congress. The Democratic Convention was held at Jamestown on July 11, and nominated J. W. Harden. The Republican Convention assembled at Watertown on August 23, and was in session three days before nominating a candidate. On the seventeenth ballot George A. Mathews received a majority over delegate Gifford, who had been the leading candidate through nearly all the balloting. The following are some of the resolutions adopted:

The Republicans of North and South Dakota, in convention assembled, hereby publish and declare: That the present Democratic Administration at Washington, emulating the present Tory Administration in the government of Ireland, has maintained and exercised a tyranny over this Territory, unjust, unwarranted, and subversive of the principles of the founders of the republic, in denying admission into the Union of the States, for the sole and only reason that a majority of our people differ with the Administration upon the political issues of the day.

That we arraign the present Governor of this Territory for prostituting his high office to personal and ambitious ends and purposes; that he maintains a perfect indifference to the wants of the people whom he rules; that he encourages large and unwise appropriations; that he threatens to veto measures unless the Legislature shall be subservient to his will; that his appointees in many cases are men who have no qualifications for office, but are his personal retainers, supported at the public expense.

That by every precedent established in the history of the admission of new States into the Union, by the rights guaranteed under the Constitution and the laws of the United States, it is the duty of Congress to admit both North and South Dakota into the sisterhood of States; and the refusal by a Democratic House to so admit us is a violation of the duties and obligations of its members, and we hereby reiterate our unaltered opposition to admission as a whole.

A revision of the tariff was favored, and the President was denounced for his pension vetoes.

A second Democratic convention, composed of delegates belonging to the faction hostile to Gov. Church, and representing twenty-three counties of North Dakota, was held at Grand Forks on September 21, at which W. R. Bierly was nominated for delegate. The platform adopted claims that it is necessary for all of the Territory lying north of the north line of the State of South Dakota to elect a delegate to the United States Congress; demands Statehood for North Dakota by the next Congress;

the election of a Legislature pledged to abolish the railroad commission, and the abolition of all Territorial laws enlarging the appointing powers of any and all Federal officers; the speedy opening of Indian reservations; the passage of an act of Congress permitting county commissioners to lease school lands at a fair rental prior to Statehood; the speedy improvement of the rivers of North Dakota and Minnesota; and the erection of safeguards in insurance of stock, grain, implements, growing crops, etc.

At the November election Mathews received 70,315 votes, Harden 40,846, and Bierly 1,758. The Republican candidate obtained a plurality of 9,509 in North Dakota, and 19,860 in South Dakota. The next Legislature will consist of 19 Republicans and 5 Democrats and Independents in the council, and 42 Republicans and 6 Democrats and Independents in the House. The presence of two Democratic candidates in the contest was the result of hostility between two factions of the party, led respectively by Gov. Church and M. H. Day. The first open rupture between these leaders occurred at Watertown, in May, when a Democratic convention met to choose delegates to the National Convention. The Day faction, being in the minority, refused to join with the Church delegates, but held a convention of its own, selected its delegates to the National Convention, and appointed a committee to secure evidence to impeach Gov. Church. But the delegates from the Church convention were admitted to the National Convention. Later in the year the committee of the Day convention published a series of charges against the Governor, his political activity being the chief cause of complaint.

DELAWARE. State Government.—The following were the State officers during the year: Governor, Benjamin T. Biggs, Democrat; Secretary of State, John P. Saulsbury; Treasurer, William Herbert; Auditor, John H. Boyce; Attorney-General, John Biggs; Chief-Justice of the Supreme Court, Joseph P. Comegys; Associate-Justices, Ignatius O. Grubb, John W. Houston, John H. Paynter; Chancellor, Willard Saulsbury.

Finance.—The Treasurer's report presents the following summary of State finances for the year ending Jan. 1, 1888: Balance in treasury at the close of the fiscal year, Dec. 31, 1886, \$29,849.08; receipts during the year, \$493,576.58; total, \$523,425.66. Paid out during the year, \$478,632.18; balance, Dec. 31, 1887, \$44,793.48. In addition to the balance of the general fund, there was due from the late Breakwater and Frankford Railroad Company, now consolidated with the Delaware, Maryland and Virginia Railroad Company, interest to July 1, 1882, amounting to \$88,866.66. The largest regular receipts were, from tax on railroads, \$62,594.79; from clerks of the peace for licenses, \$54,232.70; and from sale of school-books, \$5,640.98.

The expenditures include \$16,467.12 for the judiciary, \$12,588.24 for the National Guard, \$17,850 for interest on State bonds, \$25,000 for free schools; \$6,000 for colored schools; \$10,403 to members of the General Assembly, and \$13,078.08 for allowances made by the General Assembly. The bonded debt at the beginning of the year was \$824,750; against which the State holds the general-fund investments given above, so that the actual debt is only \$151,700.

Militia.—During 1887 the State militia was considerably strengthened and more fully equipped, with the aid of money coming from the General Government, and of an appropriation of \$2,000 by the Legislature. At the beginning of the year the force consisted of but 812 men, partially uniformed; at the close of the year there were 560, fully equipped.

Education.—At a meeting of the Trustees of the Delaware State College, held in March, the contest over the resignation of President Caldwell, postponed from the previous July meeting, was ended by the president's voluntarily asking for his release, in order to accept another place. Action upon the resignations of the professors was indefinitely postponed, except in the case of one *bona fide* resignation. The president reported that, for the year beginning in September, 1887, there were but 17 pupils in actual attendance, of whom only one paid tuition. Since its reorganization, in 1870, when it was placed under State control, the institution has had 286 male students, or an average of 13 a year. At no time has the study of agriculture and mechanic arts been the leading object of the college, as required by law. More than one hundred students have been graduated in the scientific, academic, and other courses, and thus far not one in the agricultural course.

A temporary president was elected from the Board of Trustees, which also appointed a committee to secure for the college the appropriation made by Congress for the establishment of agricultural-experiment stations in the various States. Some efforts had previously been made by the trustees to obtain this appropriation, but the Federal authorities expressed doubts whether the college could be considered an agricultural college, to which alone by the statute the donation could be made. Later in the year, however, the appropriation was secured.

Wilmington.—An election for mayor and other city officers was held on June 2, at which the Democrats obtained their usual majorities except on the vote for mayor. Great dissatisfaction with the Democratic nominee existed in his own party, in consequence of which the Republican candidate, Albert Harrington, obtained a majority of 776 votes, running over 1,000 votes ahead of his ticket in a total poll of 6,588.

Political.—The only State officers to be chosen this year were three State senators and the

lower house of the Legislature entire. Nominations for these offices were made in county conventions, but State conventions were necessary to select candidates for presidential electors and for a member of Congress. The Democrats met at Dover, on August 28, and unanimously renominated Congressman Pennington, and selected an electoral ticket. Resolutions were adopted approving the work of the St. Louis Convention and the administration of President Cleveland, and continuing as follows:

We approve the administration of the Governor and other State officers, and in State affairs we advocate the continuance of the simple, honest, and economical administration of affairs which has always characterized the rule of the Democratic party; and as true Democrats we recognize and obey the popular will, as evidenced by the special election held last November, and declare ourselves in favor of accomplishing the reforms long conceded, by all parties in the State, to be demanded by popular sentiment, through the medium of a constitutional convention to be provided for at as early a day as in the judgment of the Legislature, acting for itself as a co-ordinate branch of the State government, it may be properly and constitutionally done.

The Republican State Convention, held at Dover, on September 2, nominated for Congress Charles H. Treat, selected an electoral ticket, and passed the usual resolutions in support of the national platform and ticket. On State issues the platform reaffirmed the following declarations, made at the preliminary State Convention on May 17, which chose delegates to the Chicago Convention:

The free and untrammelled suffrage which lies at the foundation of the institutions of the republic has been overthrown in this State since the enactment of the disfranchising laws of 1873. This flagrant denial of citizenship to a large portion of the people who are not the owners of property has produced a fruitful crop of dishonesty and jobbery in the management of State, county, and municipal affairs, while the assessors of the city of Wilmington and the levy court of New Castle County, in openly and boldly refusing to place upon the assessment lists over two thousand citizens whose right to qualify to vote was undisputed, have placed themselves before the public as breakers of the law, and are deserving of the execration of all good citizens.

We renew the demand heretofore reiterated by the Republican party, for the speediest calling of a convention to revise the Constitution of this State, and urge upon the voters that no one should be sent to the next Legislature known to be opposed to this measure of reform.

We recognize the fact that the saloon has become a potent element in the politics of the State, and is being used to influence and control the action of the people in the exercise of their political rights; and as the question of licensing houses for the sale of intoxicating drinks involves the moral as it does the political rights of the people, we believe it to be the duty of the Legislature to enact laws that will make effective their will in this respect. We, therefore, declare ourselves in favor of a law embracing the principle of local option, and providing for high license when granted.

We approve of the recent act of the Legislature in securing to the city of Wilmington honest elections through the operations of a registry law, and declare ourselves in favor of similar legislation by extending the same principles to all State and county elections.

To which the later convention added the following:

We believe that the will of the people is supreme in making or amending the fundamental law of the State, and that no convention should be called for that purpose but by the authority of the people; and it is the sense of this body that the large majority of votes cast for a convention at the special election held the first Tuesday of November, 1887, is the proper evidence of the will of the people in this matter, and should be accepted by the General Assembly as full authority for passing an act, at its next session, calling a convention and providing for the election of delegates thereto at as early a period as practicable.

A Prohibition ticket was also in the field, headed by Charles E. Register for Congress. At the November election, Mr. Cleveland received 16,414 votes; Gen. Harrison, 12,973; Mr. Fisk, 400. Congressman Penington was re-elected by a majority equal to that for the Democratic electoral ticket; but, while the Democrats carried the State, their candidates for the Legislature in Kent and Sussex Counties were unexpectedly defeated. Two of the three senators elected, and 14 of the 21 representatives, were Republicans. This result gives the Republicans a majority of 2 on joint ballot in the next Legislature (Senate, 7 Democrats, 2 Republicans; House, 7 Democrats, 14 Republicans), and insures the election of a Republican successor to United States Senator Eli Saulsbury. This overturn was the result of an attempt to defeat the re-election of Senator Saulsbury, made by certain members of his own party. At the primaries in Kent and elsewhere the anti-Saulsbury faction succeeded in nominating candidates favorable to James L. Wolcott, the leader of that faction; and the followers of Saulsbury retaliated at the polls by voting for the Republican candidates.

Elections.—The Governor says, in his message to the Legislature:

The use of money at elections everywhere is alarmingly on the increase. That use has in this State become so great as to call forth a protest by all who favor the purity of the ballot. The present law upon the statute-book does not seem to meet the present needs, and the enforcement of its provisions is practically a dead letter. I deem it my duty to call your attention to the wholesale bribery which has become a main feature in elections, and urge upon you the necessity of prompt action in the matter. So unblushing has the practice become, that the votes of men are openly bartered for and secured. I would suggest that you take into consideration the enactment of a law governing the holding of all primary elections in this State. There is at present no statute regulating the same, excepting one relating to the primary elections in New Castle County.

Constitutional Convention.—The Republican party, by its platform declarations of this year, committed itself to calling a constitutional convention, although at the election of last year the vote in favor of such convention did not quite reach the figures required for such an act by the existing Constitution. In view of the success of the Republicans in the election, the Governor cautions the Legislature as follows:

By an act passed at the last session of the General Assembly, a special election was held on the day there-

in specified. At that election the number of votes cast for a convention is by many held under the provisions of the Constitution to be insufficient to authorize you to call the same, or make provisions for its calling. You will at the outset be confronted with the grave question, whether or not you, as legislators, have authority under the provisions of Article IX to call a convention upon the basis of the vote cast as aforesaid. No rash measures should be resorted to. It is better to make haste slowly in securing that which is deemed necessary, and which the increase of population and needs of the State may require, than it would be to attempt to secure it by means seemingly at least revolutionary.

DENMARK, a constitutional monarchy in Northern Europe. The King, Christian IX, born April 8, 1818, succeeded to the throne Nov. 15, 1868. He is a member of the house of Schleswig-Holstein-Sonderburg-Glücksburg, and was appointed to the succession of the crown of Denmark by the treaty of London of May 8, 1852, and by the Danish law of succession of July 31, 1853. The Constitution of Denmark is embodied in a charter, according to which the executive power is vested in the King and his ministers, and the right of making and amending laws in the Rigsdag or Diet, acting in conjunction with the King. The Rigsdag comprises the Landsting and the Folkething or House of Commons. The former consists of 66 members, of whom 12 are appointed for life by the Crown from among the actual or former representatives of the kingdom, and 54 are elected indirectly by the people for a term of eight years. The Folkething consists of 102 members elected by universal suffrage for a term of three years in the proportion of one member for every 16,000 inhabitants. The Landsting, besides its legislative functions, appoints from its midst every four years the assistant judges of the Rigsret, who with the ordinary members of the Høiesteret, form the highest appellate court, and can alone try parliamentary impeachments.

The ministry or *Stateraadet* consists at present of the following seven members: Jacob Brønnum Scavenius Estrup, President of the Council and Minister of Finance; H. G. Ingerslev, Minister of the Interior; J. M. V. Nellesmann, Minister of Justice and for Iceland; Otto Ditlev, Baron Rosenørn-Lehn, Minister of Foreign Affairs; Col. J. J. Bahnsen, Minister of War; Commander N. F. Ravn, Minister of Marine; J. F. Scavenius, Minister of Public Education and Ecclesiastical Affairs.

Area and Population.—The area of Denmark and its dependencies is 14,124 square miles, and the estimated population on Jan. 1, 1886, was 2,108,000. The increase in the population has averaged 10.29 per cent. in the towns and 5.99 per cent. in the country districts during the past fifteen years. The population of Copenhagen in 1886 was 285,700. The average emigration for the ten years preceding 1887 was nearly 6,000 per annum. Nearly all the emigrants settled in the United States. Between 1851 and 1878 about 20,000 Danes joined the Mormon community in Utah. The conversions

have since been fewer in each succeeding year. In 1887 only 120 Danes were baptized into the Mormon Church.

The Army.—The total peace strength of the army in 1887 was 385 officers and 16,318 men. The war strength is about 50,000 officers and men, exclusive of the extra reserve force of 14,000 officers and men, which is only called out in emergencies.

The Navy.—At the end of 1887 the Danish navy consisted of 83 steamers, of which 9 were armor-clad ships. The others were 1 cruiser frigate, 2 cruiser corvettes, 4 third-class cruisers, 8 gun-boats, 4 school-ships, and 5 survey vessels. The "Tordenskjold" is the largest torpedo-vessel in the Baltic. She is protected with deck-armor and a belt of cork, and carries a 14-inch Krupp-breech-loader in a thickly plated barbet tower, and two torpedo-launches, besides appliances for shooting Whitehead torpedoes. Denmark has a fleet of 14 torpedo-boats, and is building 20 more.

Finances.—The estimated revenue for the year ending March 31, 1889, is 53,799,872 kroner, or \$14,465,189, derived from the following sources: Domains, 882,674 kroner; interest of reserve fund, railway surplus, etc., 4,363,385 kroner; direct taxes, 9,576,600 kroner; stamp duty, 2,755,000 kroner; duty on inheritance and transfer of property, 1,954,000 kroner; law fees, 2,114,400 kroner; custom-house duties, excise on distilleries, etc., 27,527,400 kroner; lottery, 900,000 kroner; revenue from the Faroe Islands, 63,278 kroner; revenue from sinking-fund, deposits, and pension funds, 2,223,285 kroner; miscellaneous receipts, 1,489,850 kroner. The total expenditure for the same year is estimated at 55,879,705 kroner, or \$15,024,831, apportioned as follows: Civil list and appanages, 1,223,744 kroner; Rigsdag and Council of State, 306,616 kroner; interest and other expenses of the national debt, 7,176,940 kroner; pensions, 3,463,265 kroner; Ministry of Foreign Affairs, 386,456 kroner; Ministry of the Interior, 2,851,530 kroner; Ministry of Justice, 3,207,657 kroner; Ministry of Public Worship and Education, 1,973,440 kroner; Ministry of War, 10,386,617 kroner; Ministry of the Navy, 6,599,766 kroner; Ministry of Finance, 3,166,472 kroner; Ministry for Iceland, 99,964 kroner; extraordinary state expenditure, 8,370,898 kroner; public works, 6,666,340 kroner. A reserve fund that is maintained to afford means at the disposal of the Government in the event of sudden emergencies amounted, in 1887, to 27,870,000 kroner. The public debt, on March 31, 1888, was 193,017,689 kroner. The foreign debt was 18,819,666 kroner in 1887. The expenditure for the public debt in 1887 was 7,176,940 kroner.

Commerce.—The total value of the imports for the year 1885 was 249,223,711 kroner, or \$67,013,483, and of the exports, 162,261,370 kroner, or \$43,630,276. The commerce was divided among the different classes of goods in 1885 as follows:

CLASSES.	Imports.	Exports.
	Kroner.	Kroner.
Food-stuffs	84,500,000	118,900,000
Textiles and clothing	41,700,000	8,700,000
Other articles of consumption	31,900,000	4,600,000
Raw materials	85,600,000	23,900,000
Tools and plant	15,500,000	10,600,000

The principal articles of import and their values in 1885 were as follow: Textiles, 86,612,490 kroner; cereals and flour, 82,895,982 kroner; metal manufactures, 20,671,807 kroner; timber and manufactures of, 19,198,917 kroner; coal, 14,780,388 kroner; linseed, colza, etc., 11,757,705 kroner; stones, 8,254,454 kroner; coffee, 6,972,216 kroner; sugar, 6,165,220 kroner; tobacco, 5,295,029 kroner. The chief exports and their values in 1884 were as follow: Cattle and other animals, 38,240,830 kroner; butter, 30,398,629 kroner; hams, etc., 13,173,076 kroner; hides, 7,618,645 kroner; wheat-flour, 7,266,648 kroner; barley, 6,563,253 kroner; fish, 6,218,853 kroner; eggs, 3,859,893 kroner; woolen goods, 3,349,555 kroner. The trade of Denmark with the principal commercial countries is shown in the following table, which gives the values in kroner.

COUNTRIES.	Imports from—	Exports to—
Germany	93,570,417	63,386,823
United Kingdom	54,170,549	62,903,154
Sweden and Norway	42,024,975	32,503,376
United States	15,824,916	2,180,028
Rest of America	1,294,888	14,408
Russia	11,025,965	2,214,876
Holland	6,619,428	628,755
France	5,524,600	1,910,495
Belgium	4,990,124	1,323,179
Danish colonies	4,148,978	4,198,155
Spain	1,574,565	120,606
Asia	821,373	343,144

Of the total area of Denmark, 80 per cent. is productive. The leading crops are rye, barley, oats, and wheat. The total value of the agricultural product in 1883 was 293,407,276 kroner. In 1885 15,448 cattle were imported and 98,807 exported.

The export of butter is chiefly to Great Britain. Oleomargarine is also exported. A law to regulate its manufacture and sale was passed on April 1, 1885, and renewed in March, 1888. By a narrow majority, the Folkething refused to forbid the coloring of artificial butter or the mixing of artificial with natural butter, as demanded by the Government, but agreed to restrictions whereby a fixed scale of colors must be used and not more than 50 per cent. of butter may be mixed with imitations. The Government was given discretionary power to prohibit the exportation of butterine. This question for the first time in many years brought a part of the Opposition to the support of the Government, and caused members of the Conservative party to vote with the Opposition. The country is suffering from an economical depression, which especially affects the agricultural class, comprising two thirds of the population. The constitutional struggle has hitherto prevented the people from dividing

into a land party and a town party, but the present parties seem to be tired of their interminable contest, and the vote on the new oleomargarine bill indicates a tendency toward the same political grouping of interests that prevails in Sweden. The increase in German import duties has nearly closed one of the main outlets for important agricultural products, and more recently Sweden has raised her tariff and thus shut off another large market for Danish exports. The constitutional crisis has prevented the conclusion of treaties of commerce and navigation for the extension of foreign markets, and even the renewal of treaties that have expired, like the one with Spain. The Danes are troubled about the injury to their commerce and shipping interests that the German North Sea canal is expected to cause. Some propose a rival canal across Jutland, connecting the Cattegat with the North Sea; others have revived the old idea of a Scandinavian customs union; and many statesmen of both parties think that a good part of the North Sea trade can be preserved to Denmark by establishing a free port at Copenhagen besides the customs port. For the examination of this last mentioned project both houses of the Rigsdag have voted considerable sums of money, and the Government has appointed a commission to take the subject in charge.

The Constitutional Crisis.—The chronic conflict between the Executive and the Folkething over military and naval appropriations was renewed when the Government brought in the budget in January, 1888. When the struggle began, on the accession of the Estrup ministry in 1876 and the first presentation of the fortification scheme, the people sustained the position taken by the lower house by electing a Liberal majority of two thirds. After repeated dissolutions, the Liberals have retained their preponderance, numbering 75 in the present Folkething, against 27 Conservatives. At first all the ministers were taken from the Landsting. Later, three of the seven were chosen from among the Conservative members of the representative chamber. The budget of 1889 was amended by the committee of the Folkething, to which it was referred, and early in March was passed in the modified form by a vote of 78 to 10, with 18 abstentions. The budget committee of the Landsting restored the army appropriations and the items of the provisional budget of the previous year that the lower house had stricken out. A joint committee of both Houses was unable to frame a budget that was satisfactory to the Folkething, which, moreover, stood out against the fortification project that was again presented by the Government. For this the sum of 1,387,112 kroner had been raised by voluntary contributions before April 1, when the King closed the session and again decreed a provisional budget. The Government bases its action on an article of the Constitution that authorizes the promulgation of provisional laws in

cases of urgent necessity; and the Høiesteret decided, when the question was brought up in a private suit, that the provisional decrees are constitutional unless they are rejected by both branches of the Legislature. Legislation by Executive edicts has not been confined to the ordinary finance law, but the criminal and press laws have been modified by provisional laws, which the Folkething has subsequently rejected, while the Landsting, without expressly ratifying them, has refrained from adverse action. The Rigsret, which is alone competent to decide constitutional questions, has not yet passed upon their validity. The Minister of War announced, after the rejection of the project for fortifying Constantinople on the land side, that the work would nevertheless be begun, and that the Government would obtain the money where it could find it. This project has been before Parliament for fifteen years. Some of the military authorities, as well as the majority of the Folkething, condemn the plan, because it transcends the financial abilities of the country, and it would take nearly the whole Danish army to man the fortress, leaving three quarters of the country defenseless.

From both parties proposals have gone forth for the cessation of the long dead-lock. Before the reassembling of the Parliament on October 1, party caucuses were held to consider the basis of a compromise. The Government has promised the associated labor organizations to bring in measures for the establishment of superannuation and invalid insurance funds, and is disposed to follow the German scheme of social legislation as a means of counteracting socialism, which is spreading among the trade-unions. The majority of the agricultural labor-unions of Zealand in 1888 united formally with the Social Democratic party, while the minority set up a political programme embracing superannuation pensions for laborers, abolition of indirect taxes and duties on necessities, secrecy of elections, and improvement of the common schools. The Social Democrats demand woman suffrage also. The Liberal Opposition in the Folkething is divided into groups, called the People's party, the Left, the Progressives, the Liberalists, the Constitutional Defense Association, and the Democrats. All except Berg's diminished following are in favor of co-operating with the Conservatives in productive legislation. Only ten members of the Folkething still support the former leader of the Liberal party in his demand for ministerial responsibility to Parliament and the selection of the Cabinet from the majority. Some of the present leaders of the Opposition are ex-Ministers Klein and Krieger, who, with other Moderate Liberals, left the Ministerial party in 1887. The Liberals have recently conceded the complete legislative equality of both houses of the Rigsdag and the right of the King to appoint counselors of his own selection.

Foreign Relations.—The sum of the external aspirations of the Danish people is comprised in their hope of the restoration of North Schleswig, embracing the part north of Flensburg and Tondern, and including those towns. The Treaty of Prague contains a promise that this district would either be restored to Denmark or its inhabitants would be allowed to decide by a vote whether they should be Danes or Germans. The present Government, by its fortification scheme and in its general policy, betrays antagonism toward Germany. The majority of the people, however, see no escape from commercial and political dependence on their powerful neighbor, and deem a friendly and conciliatory policy a necessity. A small party of old Danes are still filled with hatred for their former foes. The young German Emperor endeavored to win good opinions in Denmark by sending objects from the royal collections to an international exhibition that was held at Copenhagen in the summer of 1888, and thus encouraging German manufacturers to take part. In the latter part of July he visited the Danish capital. While he was driving with King Christian, the crowds of Germans on the streets raised cheers in their own language, and many Danes hurried, while others hissed.

Iceland.—The chief of the dependencies of Denmark is Iceland, which has an area of 39,756 square miles, and in 1880 had a population of 72,445. It has its own constitution and administration under a charter dated Jan. 5, 1874. The legislative power is vested in the Althing, consisting of 36 members, of whom 30 are elected by popular suffrage, and 6 are nominated by the Crown. At the head of the administration is a minister who is nominated by the Crown, and is responsible to the Althing. The highest local authority is the Governor or Stifamtmand. There are also three amtmands for the western, northern, and eastern districts of Iceland.

Colonies.—The Danish colonies of the greatest commercial importance are in the West Indies, and consist of the islands of St. Croix, St. Thomas, and St. John. The inhabitants are engaged in the cultivation of the sugar-cane, and export from 12,000,000 to 16,000,000 pounds of raw sugar, and about 1,000,000 gallons of rum annually. The colonists of St. Croix have determined to relieve themselves of the burden of the military force quartered upon them by the Danish Government, which absorbs \$75,000, or half the revenue of the island. The colonial council has adopted a resolution, in spite of the objections of the Governor, in favor of replacing the Danish military with a police force that will cost only \$32,000 per annum. The imports from Greenland to Denmark in 1885 amounted to 511,089 kroner, and the exports from Denmark to Greenland to 619,513 kroner.

DIPLOMATES, DISMISSION OF. More than one diplomat has been requested by the United

States to leave her boundaries, or has been recalled by the power from which he was accredited. The first foreign diplomat to render himself obnoxious to the United States was citizen Genet (sometimes also spelled Genest), Minister from France. During Washington's second term it became known that a diplomatic envoy had been commissioned by the new French Republic, and was on his way to America. The President had been advised by his Cabinet to receive him at once upon his arrival, but neither Washington nor his advisers had any idea that the chief object of the new mission would be to break up the policy of neutrality just formally proclaimed. There was in the United States at this time a popular sentiment in favor of France, and this sentiment had in the Cabinet of Washington an earnest sympathizer in the person of Thomas Jefferson.

Though honestly in favor of preserving neutrality as long as possible, Mr. Jefferson held doubts, and not without reason, of our ability to preserve it against the feebly disguised ill-will of Great Britain; and in the event of a rupture with that country his judgment was by no means adverse to a close union with France. Mr. Genet, when accredited to the United States, was yet quite a young man, not more than twenty-seven years of age. He had been well trained, and through the influence of his sisters, who were in the household of Queen Marie Antoinette, had entered the diplomatic service at St. Petersburg, but he had imbibed such heated revolutionary sentiments that, at the breaking out of the French Revolution the Russian Government seized the first opportunity to furnish him his passports to return to Paris. This event probably recommended him to the extremists in France, and particularly pointed him out as a suitable agent to serve their objects in republican America.

In the year 1793, to go as Mr. Genet did from Paris to Philadelphia by way of Charleston, S. C., was not less out of the way than it would be now to go from here to London by way of Rio Janeiro. There could have been but one object in journeying thus—that was to try the temper of the populace before going to the Government. If such was the case, nothing could have been more satisfactory to Mr. Genet. He was received at Charleston with great attention, and his progress through the country to Philadelphia was a continued ovation.

Mr. Genet was neither crafty, cool, nor insincere, and the incense offered him completely turned his head. He began at once to deal out commissions to fit out privateers and to enlist officers and men for the French naval service.

President Washington received him with all proper courtesy, and Mr. Jefferson for a moment seemed to have cherished visions of international amity; but they were both rudely wakened from their repose by the complaints

of the British minister, Mr. Hammond, remonstrating against the capture of British vessels by ships fitted out from United States ports under the authority of this new envoy. So outrageous became the actions of Mr. Genet, and so offensive was his mode of treating the Government, that he speedily forfeited the friendship of Mr. Jefferson, and fell in the popular esteem faster than he had ever risen, and ultimately was deposed in disgrace at the request of President Washington. He had, however, in the mean time married a daughter of Governor Clinton, of New York, and he remained here some years after being deposed from his place as minister.

In Jefferson's administration there was a good deal of trouble with a Spanish minister, Mr. Carlos de Yruja. For some interference, the President requested his recall, and the Spanish Government promptly recalled him and sent another minister to take his place. But he, too, had married an American woman, Miss McKean, of Philadelphia, and as a deposed minister he remained, rendering himself, however, so obnoxious to the Government that President Jefferson requested him to leave the country. He replied that he received instructions from his King, and not from the President. John Quincy Adams, then in Congress, introduced a bill empowering the President to convey out of the country any minister who remained after his recall and after reasonable notice to leave. This action of Congress was reported to the Spanish Government, and resulted in a peremptory demand for him to return, which he reluctantly obeyed.

Mr. Madison's administration was not free from like trouble. The English minister, Mr. Jackson, representing George III, rendered himself so objectionable by outrageous interference in our affairs that his recall was demanded after a very brief stay.

The next dismissed minister was Nicholas Poussin, who represented France. His offense was an insolent criticism of an action taken by the Department of State on some French claim while Gen. Taylor was President and John M. Clayton Secretary of State. His dismissal was very summary. His passports were sent to him in reply to his insolent communication to the Department of State.

Sir John F. Crampton was the next minister dismissed. He had for some years most acceptably represented England at Washington, but, as he broke the provisions of international law by recruiting here for the British army during the Crimean War, his recall was requested.

Then came the Catacazy sensation. He succeeded Mr. Stockl as Minister from Russia. He brought with him his wife, and her beauty rendered her so conspicuous that unpleasant memories were awakened of her previous residence in and about Washington before she had become Madame Catacazy, and Mrs. Fish, wife of the Secretary of State, refused to receive

her. The minister's position was not agreeable, and, as he was very far from being an agreeable person, he soon got into trouble, and eventually the minister and his surroundings became so objectionable that President Grant requested his recall.

The latest diplomate in difficulty was Lord Sackville West, the British minister. Up to the date of his blunder he had been one of the most popular of foreign ministers. About the end of October, 1888, he received a letter from one Charles F. Murchison, who represented himself as a naturalized citizen of English birth, and asked advice as to the party for which he should vote. The British Minister replied to this letter, and advised his correspondent to vote for Grover Cleveland and the Democratic party, as favorable to England. This letter of Murchison's was generally conceded to be a trap set to embarrass the British Minister, whose recall was at once requested. The request not being promptly complied with, the Department of State, on the 30th of October, sent Lord Sackville his passports. The incident, happening during a presidential canvass, created much excitement.

DISASTERS IN 1888. Trustworthy records of disasters are always difficult of access. First reports almost invariably place the losses, whether of life or property, at a higher figure than the facts justify; and the final authentic reports are published, if at all, only in local journals or in court records, where they are practically inaccessible for general reference. The following list is necessarily taken from many different, and often contradictory sources of information. As a rule, no accidents are noted that involve the loss of fewer than three lives. A vast majority of the accidental deaths that occur take place by ones and twos, and are so numerous that space can not be spared to record them. In most cases, it has been possible to give a trustworthy monthly summary of the deaths and injuries caused by railroad accidents, the records of these being more fully collated and compared than any other class of accidents.

January 4. Fire: \$200,000 worth of property destroyed in Los Angeles, Cal.

5. Railway: broken trestle on the Canadian Pacific Railway, 6 killed. Fire: storehouse in United States Navy-Yard, Brooklyn, loss \$200,000. Railway: landslide near Eggleson Springs, Va., train derailed, 3 killed, 1 injured.

7. Fire: in Chicago, Ill., loss \$500,000. Heavy losses also in Louisa Court-House, W. Va.

9. Railway: collision near Edison, Wyoming, 2 killed, 10 injured.

10. Railway: broken wheel near Haverhill, Mass., 9 killed, 13 injured (5 fatally).

11. Earthquake shocks in Canada.

12. Earthquakes in South Carolina and Georgia. Blizzard in Dakota, many lives lost. Fire: exhibition building in Columbus, Ohio, 300 valuable dogs killed. Panic in a town in the Tyrol, 8 lives lost.

13. Fire in Indianapolis, loss \$1,000,000 (estimated). Blizzard in the Northwest, many lives lost by exposure.

14. Fire: railway buildings burned at Fort Worth, Tex., loss, \$100,000.

Foreign Relations.—The sum of the external aspirations of the Danish people is comprised in their hope of the restoration of North Schleswig, embracing the part north of Flensburg and Tondern, and including those towns. The Treaty of Prague contains a promise that this district would either be restored to Denmark or its inhabitants would be allowed to decide by a vote whether they should be Danish or Germans. The present Government's fortification scheme and in its general betrays antagonism toward Germany, a majority of the people, however, from commercial and political considerations, and their powerful neighbor, and a conciliatory policy a ne party of old Danes are still for their former foes. Emperor endeavored to Denmark by sending collections to an int was held at Copenhagen, 1888, and thus facturers to ts July he visits was driving of German their ow raged, .

States to leave her called by the credited. himself oitir M

more than 100 killed, shipwreck: collision, steamer Deal, England, 10 lives lost. at Workington, England;

derailed near Portville, N. Y.,

ship Smyrna and steamer, 18 lives lost.

ich fishing-fleet reported caught 187 lives lost. Floods: much ad and in Minnesota and Wisconsin ship Queen of the Pacific Cal.

for the month, number of injured 191.

loaded with dynamite exploded Gap, Pa., 17 dwelling-houses injured. Shipwreck: American

nk by collision with British Cape Henlopen.

i and Moradabad, India, about

150 lives lost.

10. Explosion of gas: St. Paul's Cathedral, Buffalo, destroyed. Falling rocks in a mine in Saxony, 18 killed.

12. Floods: much damage in Iowa and Illinois.

13. Lightning: oil-tanks exploded at Oil City, Pa., a great fire ensues, endangering the town.

14. Railway: collision near Fountain, Col., fire and explosion of a powder-car followed, 4 killed, 20 injured.

15. Railway: collision, Moscow and Kurak Railway in Russia, 11 lives lost; train derailed near Salda, Col., 18 injured.

17. Explosion: 8,000 pounds of powder and 125 pounds of dynamite near Stockton, N. J., 1 killed, 6 injured.

20. Floods (see May 12): the overflow of the Mississippi begins to subside, after having done immense damage.

21. Floods in Mesopotamia, 500 lives lost (estimated).

23. Railway: two trains derailed almost simultaneously from parallel and adjacent bridges near Cameron, Iowa, 4 killed, 8 injured.

30. Railway: collision near Bordeaux, Wyoming, 3 killed, 6 injured.

Railway: summary for May, total number of accidents 144, killed 48, injured 168.

June 1. Explosion: steam-boiler at Wyandotte, Mich., 3 killed.

4. Railway: collision near Tampico, Mex., 13 killed, 41 injured. Fire: Mundine Hotel burned in Rockdale, Tex., 11 lives lost.

7. Storms in New England and Canada, losses of life and property.

13. Shipwreck: loss of a German steamer with 1,100 pilgrims on board.

14. Railway: train derailed near Braddock, Kan., 15 injured.

18. Floods: Leon river, Mex., much property destroyed, more than a thousand lives lost.

19. Railway: train derailed near Pope's Head Run, Va., 4 killed, 5 injured. Fire: steamer Nord burned at Kiel, 8 lives lost.

24. Drowned: steam-launch capsizes in Passaic river, 6 lives lost (five women).

26. Railway: collision near Cable City, Pa., 6 killed, 4 injured.

27. Railway: train derailed near Tennesseas, Ala., 4 killed, 6 injured.

30. Floods: (reported) Canton river, China, 2,000 lives lost (estimated).

Railway: summary for the month, total number of accidents 148, killed 40, injured 125.

July 5. Tornado at New Brunswick, N. J., 1 life lost, several injured, and many buildings damaged.

6. Railway collision near Nanticoke, Pa., 30 injured. Explosion: steam-boiler in Pittsburg, Pa., 3 killed, several injured.

Explosion: in a coal-mine near Kaiserlautern, Germany, 41 killed.
 14. Railway: collision near Colton, Neb., 2 killed, 10 injured.
 15. Drowned: several thousand workmen engaged in repairing the levees of the Yellow river, China.
 16. Explosion: steam ferry-boat near South Vallejo, Cal., 30 lives lost.
 17. Railway: summary for the month, total number of accidents 174, killed 88, injured 164.
 18. Shipwreck: French schooner Fleur de la Mer, off Cayenne, 60 lives lost.
 19. Hurricane in Madagascar, 11 vessels wrecked, 20 lives lost.
 20. Fire: office of the "Evening Union" burned at Springfield, Mass., 6 lives lost.
 21. Storm in the North Atlantic States, commonly known as the "Blizzard," about 70 lives lost, many vessels wrecked, and railway traffic suspended for several days. Railway: train derailed, 3 killed, 8 injured.
 22. Railway: train derailed by snow near Sharon, N. Y., 4 killed, 4 injured.
 23. Railway train derailed and bridge broken near Blackshear, Ga., 27 killed, 85 injured. News of an earthquake in China; many thousand lives lost.
 24. Fire: the Baquet Theatre at Oporto, Portugal, more than 100 lives lost.
 25. Railway: train derailed near Oswego, Ore., 19 injured.
 26. Explosion in a mine near Rich Hill, Mo., 5 killed, 28 injured.
 27. Railway: summary for the month, total number of accidents 172, killed 85, injured 211.
 28. Fire: Amphitheatre at Zelaya, Mex., 18 lives lost, many injured.
 29. Shipwreck: bark Princess, off Caminha, Portugal, 28 lives lost.
 30. Railway: bridge carried away near New Hampton, Iowa, 6 killed, 20 injured.
 31. Railway: train derailed near Rockingham, Vt., 2 killed, 5 injured.
 32. Shipwreck: loss reported of steamer Rio Janeiro with 120 passengers.
 33. Railway: train derailed near King's, Ala., 4 killed, 10 injured.
 34. Railway: collision near West Philadelphia, Pa., 1 killed, 23 injured.

- Fire: farm-house burned near Sault St. Marie, 4 lives lost.
- Earthquake in Maryland.
- Heavy rains destroy much property in the Mississippi valleys.
- Diamond-mine at Kimberly, South Africa.
- At Alpena, Mich., 1,800 people rendered homeless.
- Broken bridge near Orange Court-killed; derailment and broken trestle Court-House, Va., 9 killed, 22 injured.
- Pennsylvania, much damage done.
- Shipwreck: British ship *Star of Greece*, off Adelaide, Australia, 17 lives lost.
15. Volcanic eruption in Japan, 500 lives lost (estimated); violent storms in the northern United States.
17. Railway: collision near Oxmoor, Ala., 2 killed, 8 injured.
19. Storm: Wheeling, W. Va., and vicinity, 23 lives lost.
20. Explosion on board a tug-boat near Westport, Ind., 7 lives lost.
- July 30. Volcanic eruption reported in Philippine Islands, 100 lives lost (estimated).
- Railway: summary for the month, total number of accidents 157, killed 60, injured 169.
- August 1. Railway: collision at Olive Hill, Ky., 3 killed, 3 injured.
3. Fire: New York city, 20 lives lost.
8. Railway: train derailed near Morgantown, Ind., 18 injured. Fire: New York City, 4 lives lost.
9. Fire: at Chattanooga, Tenn., 6 lives lost. Yacht upset on the Delaware river near Pennsville, N. J., 5 women drowned.
10. Yellow fever becomes epidemic at Jacksonville, Fla.
11. Flood: reservoir bursts in Valparaiso, Chili, 50 lives lost.
13. Railway: landslide near Shohola, Pa., wreck took fire, 1 killed, 23 injured.
14. Shipwreck: collision off Nova Scotia, steamers *Thingvall* and *Geiser*, the latter sank, 117 lives lost.
21. Floods: great damage in Louisiana and on the upper Ohio.
23. Shipwreck: collision off San Francisco, steamers *City of Chester* and *Oceanic*, 20 lives lost. Boiler explosion at Neenah, Wis., 14 killed, 9 injured. Tornado in the vicinity of Still Pond, Md., and in Delaware, 11 lives lost.
26. Railway: train derailed near Fort Buford, Dak., 5 injured (3 fatally).
27. Railway: collision near Krum, Iowa, 3 killed, 4 injured. Shipwreck: Norwegian steamer *Bratsberg* on Cape Balance, Gulf of St. Lawrence, 15 lives lost. Fire in Hamburg, 6 lives lost.
31. Shipwreck: collision, steamers *Snarbrook* and *Cairo*, off Tarifa, Spain, 11 lives lost. Waterspout near Little Rock, Ark., 7 lives lost.
- Railway: summary for the month, total number of accidents 222, killed 56, injured 202.
- September 1. Oil-tank bursts near Findlay, Ohio, fire ensues, 3 lives lost.
2. Fire in Baltimore, Md., 7 lives lost. Platform falls at a religious meeting in Belgium, 3 killed, many injured.
4. Landslide, Monroe, N. H., 5 killed.
5. Railway: collision in France, 9 killed, 18 injured.
9. Railway: collision near Waynesville, Ohio, circus train run into by freight train, 5 killed, 22 injured, cause, fog. Fire in San Francisco, estimated loss, \$1,000,000. Destructive floods in Spain.
10. Railway: collision, excursion train run into by freight train, Rittman, Ohio, 4 killed, 25 injured. Disastrous floods in Mexico.
11. Explosion in a Montana mine, 9 killed, 6 injured. Destructive floods in Georgia. Severe earthquake shocks in Greece.
12. Railway: train derailed by cattle near Pocatello, Idaho, 3 killed, 11 injured. Cyclone in Mexico.
13. Shipwreck: collision, Steamers *Sud America* and *La France* off Canary Islands, 40 lives lost (reported). Cyclone: Cuba, 1,000 lives lost (estimated). Volcanic eruption and floods in the Philippine Islands, several hundred lives reported lost.
14. Railway: derailment, collision, and explosion, two trains wrecked near Ankenytown, Ohio, 3 killed, 36 injured (several fatally). Destructive floods in the Carolinas.
17. Floods: Tyrol, Switzerland, 28 lives lost (estimated).
19. Railway: collision near East Winona, Wis., 18 injured; accident in Hanover, 4 soldiers killed, many injured. Fire in Queensland, alleged loss, \$2,000,000.
26. Fire: prairie fires consume many houses and hundreds of acres of grain in Dakota. Destructive storm on the North Atlantic coast.
27. Fire in Kronstadt, 14 lives lost.
29. Destructive hurricane in the West Indies.
- Railway: summary for the month, total number of accidents 128, killed 46, injured 223.
- October 2. Severe storm on the Great Lakes, several lives lost, and many wrecks.
5. Shipwreck: French fishing-bark *Madeline* run down by steamship *Queen*, 21 lives lost.
6. Railway: collision near Dickerson's Station, Md., 3 killed, 6 injured.
7. Platform gives way at a church celebration in Reading Pa., 158 injured.
10. Railway: collision, excursion train, near Mud Run, Pa., 63 killed, 23 injured; Amphitheatre Falls at Quincy, Ill., 300 injured.
16. Railway: collision near Tamanend Switch, Pa., 10 killed, 23 injured.
17. Explosion and wreck: steamer *Ville de Calais*, 25 lives lost.
19. Railway: train derailed owing to a misplaced switch near Washington, Pa., 2 killed, 23 injured.
27. Railway: train derailed near Alexander City, Ala., 2 killed, 10 injured.
29. Railway: collision near Pulaski, Ky., 3 killed, several injured.
- Railway: summary for the month, total number of accidents 146, killed 120, injured 223.
- November 2. Explosion: a thrashing-machine in Bucks County, Pa., 6 killed.
3. Explosion in a coal-mine in Aveyron, France, 80 killed.
4. Railway: collision near Marshall, Tex., 3 killed, 2 injured; train derailed near Vicksburg, Miss., 3 killed, 2 injured. Fire: at Godfrey, Ill., young ladies' seminary burned, loss \$250,000. Explosion in a mine in Clinton County, Pa., 17 killed. Shipwreck: steamer *Saxmundian* off Cowes, 22 lives lost.
6. Explosion: in a mine near Frontenac, Kan., 39 killed.
7. Shipwreck: steam ferry-boat sunk near Calcutta, 60 lives lost.
9. Fire: at Rochester, N. Y., 33 lives lost. Explosion: in a mine near Pittsburg, Kan., 150 killed.
10. Shipwreck: collision off New York, steamer *Iberia* sunk by the *Umbria*.
12. Railway: collision near Rock Station, Wyoming, 2 killed, 10 injured.
14. Explosion: fire-damp in a mine near Dour, Belgium, 32 lives lost. Railway: collision near Valley Falls, W. Va., 5 killed, 4 injured.
16. Shipwreck: steamer off the coast of India, supposed loss of 900 lives. Destructive storms on the coast of Great Britain.
20. Explosion: steam-boiler in Montana, 4 killed, 4 injured.
23. Fire: business part of Eureka Springs, Ark., estimated loss \$200,000.
24. Fire: Judson Female College, Madison, Ala.
26. Railway: collision near Husted, Col., wreck caught fire, 2 killed, 4 injured.
27. Wreck: a life-boat upsets off the English coast, 12 lives lost.
30. Fire: in Calumet and Hecla mine, Michigan, 8 lives lost.

Railway: summary for the month, total number of accidents 145, killed 88, injured 179.

December 5. Railway: collision near Detroit, 10 injured (5 fatally).

6. Shipwreck: British steamer Hartlepoole, at Egersund, Norway, 17 lives lost.

8. Fire: steam ferry-boat Maryland, with a number of passenger cars on board, burned at New York.

11. Explosion in a grain-mill at Chicago, 8 killed, several injured.

12. Fire: Chicago Opera House partly burned, loss \$50,000.

13. Explosion of a gun on a French man-of-war, 6 killed.

19. Destructive storm in eastern Canada.

23. Fire: steamboat Kate Adams burned on the Mississippi, between 80 and 40 lives lost.

24. Fire: steamboat John J. Hanna burned near Plaquemine, on the lower Mississippi, more than 30 lives lost. Explosion of powder at Mount Pleasant, Ohio, 1 killed, many injured.

25. Fires: at Marblehead, Mass., and at Cincinnati, Ohio, estimated losses \$800,000 and \$200,000 respectively.

28. Explosion of a shell at Messina, Sicily, 16 soldiers killed. Earthquake shock felt in England.

30. Fire: steamer Bristol burned at her wharf, Newport, R. I.

Railway: summary of the month, total number of accidents 142, killed 87, injured 183.

DISCIPLES OF CHRIST. The "Year-Book" of the Disciples of Christ for 1888 gives the number of churches as 6,487, with 620,000 communicants; and of Sunday-schools as 4,500, with which are connected 88,340 officers and teachers, and 318,000 pupils. The number of preachers is 3,262; value of church property, \$10,868,361. The estimated annual increase of members is 47,600. Twenty-nine institutions of learning—including 5 universities, 19 colleges, and 5 institutes—are represented in the "Year-Book"; besides which several are mentioned from which no report had been received. The Annual Missionary Conventions of the Disciples of Christ, including the conventions of the General Christian Missionary Society, the Foreign Christian Missionary Society, and the Christian Woman's Board of Missions, were held in Springfield, Ohio, October 23 to 26. The first of these bodies promotes the extension and work of domestic missions and church extension in the United States and Territories, and besides applying its own special funds and directing its own working organization, co-operates with the various State boards, which represent in the aggregate a scale of operations much larger than its own. Its receipts for the year had been \$28,384, besides which it had a balance from the previous year of \$1,371. Its expenditures had been \$25,766. The receipts for the church extension fund had been \$7,028 in cash and \$20,321 in pledges. Pledges were also made during the meeting of the convention to the amount of \$60,281. Loans are made from the fund for no longer period than five years, for no larger amount than \$500, to churches whose building shall not cost more than \$5,000. It was decided to establish a branch Board of Church Extension at Kansas City, Mo. The society had employed during the year 35 labor-

ers, under whose efforts 107 churches had been visited and assisted, 51 new and unorganized places visited, 10 churches organized, and 308 persons baptized.

The State boards had altogether employed in 1887, 200 missionaries, who had organized 123 churches, assisted 68 places in building, visited and assisted 1,878 churches, visited 326 new and unorganized places, and who returned 8,970 baptisms.

A committee that had been appointed in the previous year to confer with a committee of the Free-Will Baptist Church with reference to union, reported that union would involve four fundamental points: The adoption of a name honoring Christ as the sole head of the Church; the creed basis that Jesus Christ is the Son of God; conformity of the work to the model of the New Testament; and recognition of the independence of the congregations in local affairs. The committee recommended co-operative local union, so far as practicable, to begin at once. A committee was appointed to continue the correspondence.

The income of the Foreign Christian Missionary Society for the year had been \$62,767. The receipts had increased regularly each year, except one, from the first, and the increase in the last six years had been fivefold. The society sustained 24 mission stations in England, Scandinavia, Turkey, India, Japan, and China, with which were connected 87 missionaries and 22 helpers, 2,478 converts, 2,689 children in Sunday-schools, and 380 in day-schools, and in which 798 additions of members were returned.

The Christian Woman's Board of Missions comprised 1,161 auxiliary societies in the local churches, having 14,000 members, and had received, in contributions obtained by their assistance, \$22,334. It sustained home missions, a mission in India, and missions in Jamaica, which last returned 17 stations, 1,251 members, and 700 pupils in the schools. The children's bands, of which there were 415, 117 having been organized during the year, had contributed \$4,068 to the funds of the society.

DISSECTION, an operation by which the different parts of a body are exposed for study of their structure and arrangement. Various names are given to dissection, depending upon the purpose and the organ concerned in the operation. Osteotomy has for its purpose the exposure of bones; neurotomy, the laying bare of nerves; angiotomy, the exhibition of blood-vessels; and desmotomy, the disclosure of ligaments. The history of dissection is blended with that of anatomy. Its value in the study of medicine was recognized by the ancients, and five centuries before the Christian era Democritus and Hippocrates are said to have examined the bodies of the inferior animals. Aristotle, Syennesis of Cyprus, and Diogenes of Appollonia are among the eminent men of science who dissected the lower animals for anatomical purposes. Alexandria was the seat of the first dissection of the human body.

Through the liberality of the Ptolemies, dissection became a regular part of the study of medicine. Herophilus and Erisistratus here became eminent as the first human anatomists; and the latter is reported to have been so zealous in his pursuit that he dissected not only the dead body, but the living as well. Of him Tertullian writes: "He was a butcher, who dissected six hundred men to discover nature, and hated man to learn the structure of his frame." Alexandria became the medical center of the world, and Galen is said to have traveled thither from Pergamus to see a skeleton. With the dark ages, came a decline in the study of medicine. The Mohammedans, into whose hands Alexandria had passed, forbade dissection, since it was inhibited by the Koran. Abdallatif was the only exception to this rule, and was obliged to study the bones of the body in cemeteries. The cremation of the corpse in Rome prevented the practice of dissection in that city, and Marius and Galen were content to dissect apes.

In 1315, Mondini dissected two female subjects in the University of Bologna, and dissected and demonstrated one in the following year. He was followed by Leonardo da Vinci, Matthew de Gradibus, Achillini, and Gabriel de Zerbis, all of whom dissected the human body, privately and publicly. Jacobus Sylvius taught in Paris in the sixteenth century, demonstrating his lectures on the lower animals. The greatest practical anatomist of early modern times, however, was Andrew Vesalius, who freed the medical world from the authority of Galen's ape-anatomy, and was the founder of a new school, that which prevails at the present day. His investigations on the human cadaver gave a new impetus to the study of anatomy, and it was only the dearth of bodies and the lingering prejudice against dissection that restrained the enthusiasm of his many followers. Such names as Eustachius, Fallopius, Arantius, Variolus, and Vidius, multiply with the beginnings of the new science.

Even at this time, when dissection was frequently carried on by the teachers of anatomy, it was never practiced by medical students. In the progress of time, however, practical anatomy gained in favor, and the thousands of students from all parts of Europe who attended the Italian schools of medical learning, carried their enthusiasm back to their native lands. Public feeling on the subject did not diminish, however, and was wrought still higher by repeated grave-robberies, especially in England. Recognizing the necessity of laws to govern dissection, Henry VIII, in 1540, granted to the College of Surgeons and Barbers four felons annually for dissection; and, in 1565, Queen Elizabeth gave the same privilege to the College of Physicians. These are the first two instances in history of legislation on this troublesome subject. General dissection did not flourish yet, and as late as the middle of the eighteenth century, a fine was imposed for dis-

secting outside of Barber-Surgeon's Hall. William Hunter was the first to overstep these limits, and, following his example, hundreds of men in the profession had their private dissecting-rooms. In 1752, George II decreed that all murderers executed in London and Westminster should be delivered to the medical schools. Executions were not numerous enough to supply the needs of the colleges, and a class of men arose, known as resurrectionists, who rifled the grave-yards, and who multiplied so rapidly that in 1828 there were over one hundred regular resurrectionists in London. The evil grew so monstrous that in 1829 Parliament appointed a committee to frame a law that would remedy existing troubles and provide an adequate supply for the medical schools. This committee called in as witnesses most of the eminent anatomists of the United Kingdom, and the testimony of Sir Astley Cooper is interesting for its incidental statement of the value of dissection: "Without dissection there can be no anatomy, and anatomy is our polar star; for without anatomy a surgeon can do nothing, certainly nothing well. . . . I would not remain in a room with a man who attempted to perform an operation in surgery who was unacquainted with anatomy; he can not mangle the living if he has not operated on the dead." The committee recommended that "all persons throughout the kingdom, of every rank and degree, who die without kindred or friends, or who are unclaimed by kindred or friends within a certain period, be appropriated to dissection, the body after dissection being buried with funeral rites." Three years later the Warburton anatomy act was passed, which practically embodies these suggestions, and which governs the disposition of the unclaimed dead in the United Kingdom at the present day. As a preamble the bill has the following paragraph:

Whereas, A knowledge of the causes of diseases, and methods for treating and curing them, can not be acquired without anatomical examination; and *whereas*, crimes are committed to secure bodies, which are not numerous enough, for the prevention of such crimes and for the protection of the study of anatomy it shall be legal for the Secretary of State and the Chief Secretary of Ireland to grant a license to practice anatomy to any professor or teacher of anatomy, medicine, or surgery.

Inspectors of schools of anatomy are provided for, whose duties consist in keeping as full returns as possible of subjects dissected, and who are required to see that the law is rigidly enforced. Executed murderers are exempt from dissection under this act. According to a law passed by Parliament in 1871, a body must be interred within two months after it has been secured, except when it is obtained in October, when six months are allowed.

In the United States, the first law on the subject of dissection was passed by New York State in 1789. A more comprehensive law was enacted in 1854, which, with its various amendments, stands to-day as follows:

It shall be lawful for the governors, keepers, wardens, managers, and persons having lawful control and management of all public hospitals, prisons, almshouses, asylums, morgues, and other public receptacles for deceased persons, to deliver, under the conditions hereinafter mentioned and in proportion to the number of matriculated students, the bodies of deceased persons therein to the professors and trustees in all the medical colleges of the State authorized by law to confer the degree of doctor of medicine. And it shall be lawful for said professors and teachers to receive such bodies and use them for the purposes of medical study. Medical colleges which desire to avail themselves of the provisions of this act, shall notify said governors, keepers, wardens, and managers of public hospitals, penitentiaries, almshouses, asylums, morgues, and other public receptacles for the bodies of deceased persons in the counties where the colleges are situated, and in counties adjacent thereto, of such desire, and it shall be obligatory upon said governors, keepers, wardens, and managers to notify the proper officers of said medical colleges whenever there are dead bodies in their possession that come under the provisions of this act, and to deliver said bodies to said colleges on their application: *Provided, however*, That such remains shall not have been desired for interment by any relative or friend of such deceased person within forty-eight hours after death: *Provided, also*, That the remains of no persons who may be known to have relatives or friends shall be so delivered or received without the assent of such relatives or friends: *And provided*, That the remains of no person detained for debt, or a witness, or on suspicion of a crime, or of any traveler, or of any person who shall have expressed a desire in his or her last illness that his or her body be interred, shall be delivered or received as aforesaid, but shall be buried in the usual manner: *And provided, also*, That in case the remains of any person so delivered or received shall be subsequently claimed by any relative or friend, it shall be given up to said relative or friend for interment; and it shall be the duty of said professors and teachers to dispose of said remains in accordance with the instruction of the Board of Health in said localities where such medical colleges are situated, after the remains have served the purpose of study aforesaid. And for any neglect or violation of the provisions of this act, the party so neglecting shall forfeit and pay a penalty of not less than twenty-five dollars, nor more than fifty dollars, to be sued for and recovered by the health-officer of said cities and places for the benefit of their department.

Twenty-three other States of the Union have declared dissection to be legal: Alabama, Arkansas, California, Colorado, Connecticut, Georgia, Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Hampshire, New Jersey, Ohio, Pennsylvania, Tennessee, Vermont, and Wisconsin. In all these States the law is similar in its conditions and provisions to that of New York. Most of the States have also declared disinterment of bodies to be a misdemeanor, while some States have made no provision but the gallows for the supply of bodies for the dissecting-room. The tendency at the present day, however, is strongly toward liberal laws.

In Paris and Vienna all bodies from the public hospitals and workhouses are given to the medical schools. In Göttingen the supply is maintained by the dead from the public institutions, and by the poor that are supported at the expense of the state. The same conditions exist throughout Germany. Holland

supplies its medical colleges in a similar manner, imposing but few restrictions. The dissection-laws of Canada, similar to those in the United States, were modeled after the English.

The facilities for dissection at the present day are vast improvements upon those of forty years ago. The instruments are finely made and adjusted. The soap-stone or granite slab has replaced the wooden plank on which the cadaver was laid, and the architecture and ventilation of the dissecting-room are now such as to lend a cheerful aspect to the otherwise gloomy atmosphere. A large sky-light usually covers the room, which is without windows and is lighted at night by electric lamps. Cleanliness abounds, and no unnecessary parts of a body are left in the room. The danger from dissection wounds is greatly diminished by the use of collodion, carbolated vaseline, carbolic acid, and kindred antiseptics, which are used by the students while they are at work.

The difficulty of making the vessels stand out distinctly was early recognized by anatomists. In the sixteenth and seventeenth centuries, air, water, ink, milk, and various colored fluids were used. It soon became evident that some substance must be employed that would harden in the vessels after injection, and suet and wax were next called into requisition. Improvement followed improvement, and injections of plaster of Paris, rubber, glue, and ether found adherents. But none of these methods would do for prolonged dissection, and, until the introduction of alcohol, this was almost impossible. At the present day, arseniate of soda is almost universally used; but chloride of zinc, common salt, hyposulphite of soda, and acetate of alumina still find favor. The usual method of injection is, to sever the common carotid artery near the root of the neck, and attach the peripheral end to the syringe. A pasty mass of a saturated solution of arseniate of soda and plaster of Paris is then prepared, and is forced through the arteries at short intervals of time, so as not to rupture any of the more delicate vessels. The preparation is usually tinted with some aniline dye. When the veins are injected for any purpose, a blue color is used. About three quarts of the mixture suffices for the average body. For courses in operative surgery, and for lectures on the various systems, as the vascular, nervous, and muscular, other methods are employed, sometimes more complicated than that described. In Berlin, Vienna, Paris, and Heidelberg, where the supply of bodies from the various sources exceeds the demand, no body is allowed in the dissecting-room over seven days, and no injections or antiseptic preparations are made use of. See Hyrtl's "Lehrbuch der Anatomie des Menschen" (8th ed., Vienna, 1863); "The Gold-headed Cane"; William Hunter's Introductory Lectures; and W. W. Keen's "Early History of Practical Anatomy" (Philadelphia, 1874).

DOMINION OF CANADA. The year 1886 was marked by an unusual number of changes in the Government of the Dominion. Lord Lansdowne's term of office as Governor-General expired, and he was appointed Viceroy of India, leaving Canada in May. (For biographical sketch and portrait of Lord Lansdowne, see the "Annual Cyclopædia" for 1888, page 468.) He was succeeded at Ottawa by Lord Stanley of Preston, who on June 11 issued the proclama-

heretofore existing in the House of Commons. Parliament met on February 23, and was prorogued on May 23.

Parliament was opened on February 24 by Lord Lansdowne, who delivered the following speech from the throne:

Honorable Gentlemen of the Senate:

Gentlemen of the House of Commons:

It affords me much gratification to meet you once more at the commencement of the parliamentary session, and to congratulate you upon the general prosperity of the country. Although the labors of the husbandmen have not been rewarded in some portions of the Dominion by an adequate return, the harvest of last year has on the whole been plentiful, while in Manitoba and the Northwest Territories it was one of remarkable abundance.

The negotiations between her Majesty's Government and that of the United States for the adjustment of what is known as "The Fishery Question" have, I am pleased to inform you, resulted in a treaty which will, I venture to hope, be considered by you as honorable and satisfactory to both nations. The treaty, with the papers and correspondence relating thereto, will be laid before you, and you will be invited to adopt a measure to give effect to its provisions.

The extension and development of our system of railways have not only rendered necessary additional safeguards for life and property, but have given greater frequency to questions in which the interests of rival companies are found to be in conflict, and to require authoritative adjustment. As further legislation appears to be needed for these purposes, a measure will be submitted to you for the consolidation and improvement of "the Railway act."

Experience having shown that amendments are required to make the provisions of the act respecting Elections of the Members of the House of Commons more effective and more convenient in their operation, you will be asked to consider a measure for the amendment of that statute. The act respecting Controverted Elections may likewise require attention with a view to the removal of certain questions of interpretation which have arisen and which should be set at rest. My Government has availed itself of the opportunity afforded by the recess to consider the numerous suggestions which have been made for improving the details of the Act respecting the Election Franchise, and a measure will be submitted to you for the purpose of simplifying the law and greatly lessening the cost of its operation.

The growth of the Northwest Territories renders expedient an improvement in the system of government and legislation affecting these portions of the Dominion, and a bill for that purpose will be laid before you. A bill will be submitted to you to make a larger portion of the modern laws of England applicable to the Province of Manitoba and to the Northwest Territories in regard to matters which are within the control of the Parliament of Canada, but which have not as yet been made the subject of Canadian legislation.

Among other measures, bills will be presented to you relating to the judiciary, to the Civil-Service act, and to the audit of the public accounts.

Gentlemen of the House of Commons:

The accounts for the past year will be laid before you as well as the estimates for the ensuing year. They have been prepared with a due regard to economy and the requirements of the public service.

Honorable Gentlemen of the Senate:

Gentlemen of the House of Commons:

I commend these important subjects and all matters affecting the public interests which may be brought before you to your best consideration, and I feel assured that you will address yourselves to them with earnestness and assiduity.

LORD STANLEY OF PRESTON.

The Right Hon. Sir Frederick Arthur Stanley, Baron Stanley, of Preston, P. C., G. C. B., was born in 1841, and in 1864 married Constance, eldest daughter of the Earl of Clarendon. He was created a peer in 1866, and was appointed Governor-General of Canada in 1886. He has represented Preston and North Lancashire in the House of Commons, and has held office in the Imperial Government successively as a Lord of the Admiralty, Financial Secretary for War, Financial Secretary to the Treasury, Secretary of State for War, Colonial Secretary, and President of the Board of Trade. He served in the Grenadier Guards from 1858 till 1865, and was gazetted lieutenant and captain in 1865. He is brother and heir presumptive of the present Earl of Derby. Lord Stanley of Preston is a conservative in politics.

tion announcing his appointment to the Governor-Generalship. The death of the Hon. Thomas White, Minister of the Interior, deprived the Dominion Cabinet of one of its ablest and most respected members. Mr. White was succeeded in the ministry by the Hon. Edgar Dewdney, who retired from the Lieutenant-Governorship of the Northwest Territories. Sir Charles Tupper resigned the portfolio of Minister of Finance to return to London as High Commissioner for Canada, and was succeeded by the Hon. G. E. Foster, Minister of Marine and Fisheries. The Hon. Charles Tupper (son of Sir Charles) entered the Cabinet as Minister of Marine and Fisheries. The Hon. A. W. McLellan, Postmaster-General, accepted the Lieutenant-Governorship of Nova Scotia, and his portfolio fell to the Hon. John Haggart. The Hon. J. R. Plumb, Speaker of the Senate, died during the session of Parliament on March 12.

Parliament.—Twenty-four by-elections took place during the year, but without effecting any material change in the balance of parties

The Budget.—Sir Charles Tupper, Minister of Finance, in moving the House into Committee of Ways and Means, on April 27, said that the revenue of the Dominion for the year ending June 30, 1887, amounted to \$35,754,998, an increase of \$454,998 over the estimate. The actual expenditure was \$35,657,860, an excess of \$57,860 over the estimates, thus leaving a surplus in place of the expected deficit. He estimated the revenue for the year 1887-'88 at \$86,900,000, and the expenditure at about \$87,000,000, the estimates to be laid before Parliament amounting to \$35,421,440.22: and the supplementary estimates would include amounts for mail subsidies and steamship subventions. He said the Dominion had incurred a debt of £1,000,000 in England for temporary accommodation. Since May last the country had experienced a certain amount of financial stringency, and one of the results had been that three banks had ceased to transact business. The past summer was one of unusual heat and drought in the province of Ontario, and the harvest was not up to the average. The same cause had operated against the extensive lumber industry, and on account of the lowness of the water, timber that had been cut and lay in the streams could not be made marketable. This had caused a certain drain on the resources of the banks, in order that the legitimate requirements of those engaged in the industry should be provided for. But against this they had occasion to be gratified by the splendid harvest in Manitoba and the Northwest. Still it must be borne in mind that we were going ahead rather too quickly. In our cities, and especially in Toronto, there had been a certain amount of speculation in real estate. In the end, the short crop in Ontario and these other attendant circumstances, would prove a blessing in disguise by the curtailment of importations. However, by the exercise of economy and prudence, Canada would soon recover from the present stringency, her trade being sound at the core, and would soon return to its normal condition. At the beginning of the fiscal year the Government, chiefly in deference to the banking community, lowered the limit of deposits in the savings-banks, and fixed the amount to be received from any depositor to be \$300 in any one year, and \$1,000 in all. Originally, the savings-bank deposits were unlimited; a reduction was then made to \$10,000, and afterward this was again brought down to \$8,000; now the limit is \$1,000. The effect on the Government savings-bank deposits had been that some of the larger deposits held by the Government had been withdrawn, and had gone to swell the general business of the country by transfers to the banks where higher rates of interest were offered. The million pounds sterling borrowed in England represented an amount that was expected to have been received from Canadian depositors, the capital expenditure of the country having had to be met out of ordinary revenue.

With regard to the working of the iron and steel tariff, the trade returns showed that the average duty levied by the United States on imports of iron and steel for the year ending June 30, 1887, was 41 per cent. ad valorem; the average rate for the same articles imported into Canada for the nine months ending March 31, under the new tariff, was 28½ per cent. ad valorem. Comparing the United States customs tariff on all goods imported for home consumption with the Canadian tariff on similar imports, the trade returns show this result for the year ended June 30, 1887: Average rate on United States imports, 31½ per cent. ad valorem. Average rate on Canadian imports, 21½ per cent. ad valorem. Comparing dutiable articles under the United States customs tariff with the same articles under the Canadian tariff, the trade returns for 1886-'87 show the average duty on United States imports for home consumption to be 47 per cent. ad valorem against an average of 28½ per cent. ad valorem on Canadian imports for the same period. Under the Mills Bill the average customs rates on dutiable articles, based on United States imports for home consumption for 1886-'87, is estimated to be 43½ per cent. ad valorem, while under the amended Canadian tariff for the nine months ended March 31, 1888, the average customs rates on dutiable articles entered for home consumption has been 31½ per cent. ad valorem. The effect of the tariff on the market prices had been to make a small increase, but not to the full extent of the increased duty. He took, by way of illustration, the value of warrants in Glasgow, that being the best gauge of the general level of the iron market, and as at Glasgow prices were pretty even during February and December, 1887. Taking pig-iron, the price in Canada was only from \$1 to \$1.25 per gross ton higher in December than in February, 1887, while the additional duty, which took effect July 1, was \$2.24 per gross ton, indicating that the foreign maker, carriers, and importers, etc., had made a concession of about \$1 to \$1.25 per ton to retain the trade. In other words, the consumer paid fully one half the amount of duty contributed to the revenue. As to bar-iron, the price was as follows: In February, 1887, \$1.60 to \$1.65 per 100 pounds; in December, 1887, \$1.85 to \$1.90 per 100 pounds, showing an advance of only 25 cents per 100 pounds, while the extra duty was 45 cents per 100 pounds. As to cast-iron water-pipes, the contract prices for the corporation of Montreal averaged as follows: For 1885, \$18.50 per gross ton; for 1886, \$26.21 per gross ton; for 1887, \$33.14 per gross ton; for 1888, only \$32.10 per gross ton; although the increase in duty has been \$8 per ton. The Montreal water-pipes for 1888, above referred to, are to be made in Canada from Canadian ore. The increase of price over the average for 1885-'86 is thus about half the increase in duty.

After referring in detail to the effect of the tariff in promoting the exploration of new fields

in the iron industry, and to the improved business of the old iron and steel industries, Sir Charles took up the question of trade with the West Indies. This trade, on the whole, had been good; the price of Canadian fish in the West Indies had been satisfactory to fishermen and merchant shippers. An important factor in this trade was the return cargoes of sugar and the recent change in the sugar duties. Putting the same duty upon all sugars for refining, according to their polariscopic test, had had the effect of encouraging the importation of West Indian sugar, especially into Nova Scotia. In 1878 the total value of imports entered for consumption from all the West Indies was \$1,181,728, and in 1886 this had increased to \$3,249,642.

Passing to the cotton industry, there are now about 60,000 bales of raw cotton, in value about \$3,000,000, used annually in the Dominion, being an increase in ten years of nearly 50,000 bales. In the Dominion there are now about half a million spindles, employing about 9,000 hands, with an invested capital of about \$8,000,000. To show how steadily interprovincial trade has developed in Canada, returns furnished by the Intercolonial Railway show that the following movements took place in 1878 and in 1887 in passengers and articles carried both ways:

ITEMS.	1878.	1887.
Flour, barrels.....	687,778	753,480
Grain, bushels.....	881,170	1,016,884
Live-stock, number.....	48,498	80,728
Lumber, feet.....	56,900,000	161,100,000
Manufactures, tons.....	140,868	
Other articles (not including fire-wood), tons.....	230,741	890,000
Total freight, tons.....	523,710	1,131,884
Passengers, number.....	618,957	940,144

In both years flour, live-stock, and lumber were local, as distinguished from through freight for export. As regards grain, there were 440,454 bushels local freight in 1887, against 331,470 in 1878. The total increase of freight in 1887, as compared with 1878, was 608,000 tons; and, speaking of the proportions between local and through freight, the general manager says that the increase is about equally divided. This would give an increase of local traffic equal to over 300,000 tons in 1887, as compared with 1878, or an increase of 57 per cent. The increase in the movement of passengers was indicative also of increased interprovincial trade. Taking some of the articles carried westward, the growth of this trade he regarded as indicated by the quantity of coal yearly transported by rail from Nova Scotia. For the several years from 1879 to 1886 the following quantities were carried west by the Intercolonial Railway: 1879, 570 tons; 1880, 10,246 tons; 1881, 80,629 tons; 1882, 35,089 tons; 1883, 54,891 tons; 1884, 112,898 tons; 1885, 165,791 tons; 1886, 175,512 tons.

Sir Charles submitted to Parliament a series of tables showing comparative statistics for each year since confederation. The Canada

Federal gross debt, with assets, for years ended 30th June was as follows:

YEARS.	Gross Debt.	Assets.
1867 (Confederation created).....	\$88,046,051	\$17,817,410
1868.....	94,996,666	21,139,581
1869 (Better terms to Nova Scotia).....	112,861,998	36,502,679
1870 (Manitoba created a Province, debt \$472,090).....	115,998,706	37,738,964
1871 (British Columbia admitted, debt \$1,666,900).....	115,492,682	37,736,165
1872.....	132,400,179	40,913,107
1873 (Prince Edward Island admitted, debt 4,927,060).....	129,743,482	39,994,970
1874.....	141,168,551	32,888,586
1875.....	151,668,401	35,655,028
1876 (Intercolonial Railway opened).....	161,904,687	36,658,173
1877.....	174,675,884	41,440,585
1878.....	174,957,268	34,565,199
1879.....	179,463,971	36,498,668
1880 (Intercolonial Railway finished).....	194,684,440	42,182,852
1881 (C. P. R. begun).....	199,861,587	44,465,757
1882.....	205,865,251	51,708,601
1883.....	202,169,104	43,692,389
1884 (Provincial debts assumed, \$7,173,397).....	242,482,416	60,330,506
1885 (C. P. R. finished, last spike Nov. 7).....	264,708,607	63,295,915
1886 (Temporary loan to C. P. R. of \$30,000,000. Manitoba debt assumed, \$3,817,326).....	278,164,241	50,005,234
1887 (\$10,189,521 added to debt, being purchase-money of 6,798,014 acres of land from C. P. R.).....	278,187,626	45,873,611

Canada taxation, being customs and excise duties collected, during years ended 30th June:

YEARS.	Excise.	Customs.
1868.....	\$3,002,588	\$3,578,880
1869.....	3,710,028	3,272,980
1870.....	3,619,622	9,834,313
1871.....	4,393,945	11,941,104
1872.....	4,780,652	12,757,993
1873.....	4,460,658	12,954,164
1874.....	5,594,904	14,395,193
1875.....	5,068,657	15,351,011
1876.....	5,568,487	12,934,888
1877.....	4,941,898	12,546,988
1878.....	4,858,673	12,783,524
1879.....	5,890,763	12,900,659
1880.....	4,292,427	14,071,248
1881.....	5,348,023	18,406,099
1882.....	5,884,860	21,581,670
1883.....	6,260,116	22,009,583
1884.....	5,409,309	20,028,390
1885.....	6,449,103	18,985,425
1886.....	5,852,905	19,378,552
1887.....	6,808,301	22,878,301

Canada imports for home consumption, divided into free and dutiable, during years ended 30th June:

YEARS.	Dutiable.	Free.
1868.....	\$43,655,696	\$38,829,610
1869.....	41,069,843	26,382,928
1870.....	45,127,422	26,110,181
1871.....	60,094,363	26,808,130
1872.....	63,545,718	39,168,398
1873.....	71,409,196	56,105,398
1874.....	76,225,858	51,168,316
1875.....	73,141,432	41,477,329
1876.....	60,348,246	34,489,373
1877.....	60,919,960	35,880,523
1878.....	59,776,589	31,492,988
1879.....	55,430,012	24,911,596
1880.....	54,183,267	17,599,389
1881.....	71,620,725	19,990,879
1882.....	85,757,483	26,591,494
1883.....	91,068,289	31,548,680
1884.....	80,010,498	28,170,146
1885.....	78,269,618	29,440,401
1886.....	70,656,819	28,948,575
1887.....	78,120,679	27,518,749

Imports of iron and steel and manufactures thereof into the Dominion for home consumption for years:

1868.....	84	85	1878.....	\$9,896,806
1869.....	1	86	1879.....	7,966,386
1870.....	1	87	1880.....	10,178,000
1871.....	11	88	1881.....	12,805,826
1872.....	11	89	1882.....	17,499,486
1873.....	21	90	1883.....	30,740,374
1874.....	21	91	1884.....	14,790,737
1875.....	21	92	1885.....	11,415,712
1876.....	11	93	1886.....	11,058,365
1877.....	1	94	1887.....	12,896,046

Relative value of ten principal exports (home production) from Dominion of Canada, fiscal year 1887:

Wood and manu- factures.....	\$21,104,880	Fish.....	\$4,373,810
Grain, barley, peas, and flour,.....	14,801,897	Furs and hides.....	2,923,915
Animals.....	10,481,442	Eggs.....	1,885,559
Cheese.....	7,102,978	Coal.....	1,222,372
		Meats.....	1,094,076
		Gold.....	1,017,461

The number of post-offices in the successive years has been as follow: In 1868, 3,638; in 1869, 3,756; in 1870, 3,820; in 1871, 3,943; in 1872, 4,135; in 1873, 4,519; in 1874, 4,706; in 1875, 4,899; in 1876, 5,015; in 1877, 5,161; in 1878, 5,378; in 1879, 5,696; in 1880, 5,778; in 1881, 5,935; in 1882, 6,171; in 1883, 6,395; in 1884, 6,637; in 1885, 7,084; in 1886, 7,295; in 1887, 7,534.

The postal revenue in 1868 was \$1,034,710; and the expenditure, \$1,053,570. In 1887 the revenue was \$2,603,256, and the expenditure, \$3,458,101.

The total Canadian debt payable in London, July 1, 1887, was as follows:

Rate of interest.	Amount.
2½ per cent.....	\$34,388,388
4 ".....	140,854,889
5 ".....	2,422,889
6 ".....	4,002,478

Total..... \$171,678,736

Interest paid..... \$4,850,745

Other statistical tables were submitted, similar to those presented at the previous session, and published in the "Annual Cyclopaedia" for 1887, which contained statistics from 1868 to 1886. The figures for 1887 are as follow:

Deposits by the people in the chartered banks of Canada, \$107,154,463.

Deposits in the savings-banks, \$50,944,735.

Discounts given by the chartered banks, \$169,337,835.

Total exports of Canada, \$89,515,811.

Shipping employed, not including coasting-vessels, 14,317,099 tons register.

Coasting-trade tonnage employed, 17,512,977 tons register.

Railway, mileage, in Canada, 12,291.

Life insurance in Canada, net amount in force, \$191,566,168.

Fire insurance in Canada, amount at risk in 1887, \$623,523,697; in 1886 (omitted last session), \$584,732,032.

Business failures in Canada, \$16,811,745.

After referring to the failure of Erasmus Wiman's attempt to promote unrestricted reciprocity sentiment in Canada, and deprecating the idea of driving the protected industries into the United States, Sir Charles said:

I have used a strong term; I have said this scheme of unrestricted reciprocity is a folly, a mad folly; and I say so for this reason, that if every man in this House was of opinion that Canada should commit suicide, as it would have to do by adopting unrestricted reciprocity—I say if that was the position of every man of both sides of the House, we would have no more chance of obtaining unrestricted reciprocity with the United States than we would have of dictating to the Imperial Parliament who should advise Her Majesty's ministers. Not a bit more. I can scarcely find any simile or language that would show the helplessness and the utter futility of adopting such a policy. This subject has been discussed now for many months, it has been put forth in the most captivating form by the ablest men on the opposite side of the House, both in this House and abroad through the country, and they have found papers so wanting in information and so blindly subservient to party influence as to advocate their scheme—and what has been the result? Why, point me to a paper in the United States, Republican or Democratic, Mugwump or anything else—show me a single paper possessing the slightest influence in that country that would ever give support to a scheme which would take away the barriers between the trade of Canada and the trade of the United States, and leave Canada free to admit the products of England.

Sir, we have the most abundant evidence that it is only necessary for us to have confidence in ourselves, and to devote ourselves unsparingly in the future to the great task of developing the inexhaustible resources of this country. Then, whenever the time comes that we shall have the management of these matters entirely in our own hands, we shall be able to enter upon even terms into negotiations with other countries for the extension of our commercial relations. I say, sir, that we not only have the advantage of this great domain, with its inexhaustible resources, but we have over us the flag of the mightiest empire in the world, and under itsegis we can go forth with greater confidence than any man can possess, representing a community of only five millions of people, we can go forth knowing that in the remotest section of the world that flag is waving over our heads, that there are behind us an army, a navy, and a moral force of a great empire that will give Canada all the protection that she can desire. Sir, under these circumstances, to throw away our birthright for a mess of pottage, to go looking for commercial reciprocity with a foreign country—even if we could obtain it, I say a policy of that kind would be, in my opinion, to make us forget what Canadians never will forget, the gratitude they owe to the great empire of which we form a part, and the duty of building up on this northern portion of the continent of America, a power to which every Canadian will feel proud to belong.

Unrestricted Reciprocity.—The principal debate of the session was on the question of unrestricted reciprocity between Canada and the United States.

Sir Richard Cartwright (Liberal) moved, on March 14:

That it is highly desirable that the largest possible freedom of commercial intercourse should obtain between the Dominion of Canada and the United States, and that it is expedient that all articles manufactured in, or the natural products of either of the said countries should be admitted free of duty into the ports of the other (articles subject to duties of excise or of internal revenue alone excepted). That it is further expedient that the Government of the Dominion should take steps at an early date to ascertain on what terms and conditions arrangements can be effected with the United States for the purpose of securing full and unrestricted reciprocity of trade therewith.

Hon. Mr. Foster (Minister of Marine and Fisheries) moved in amendment:

That Canada in the future, as in the past, is desirous of cultivating and extending trade relations with the United States in so far as they may not conflict with the policy of fostering the various interests and industries of the Dominion which was adopted in 1879 and has since received in so marked a manner the sanction and approval of its people.

Mr. Jones of Halifax (Liberal) moved an amendment:

That in any arrangement between Canada and the United States providing for the free importation into each country of the natural and manufactured productions of the other, it is highly desirable that it should be provided that during the continuance of any such arrangement the coasting-trade of Canada and of the United States should be thrown open to vessels of both countries on a footing of complete reciprocal equality, and that vessels of all kinds built in the United States or Canada may be owned and sailed by the citizens of the other and be entitled to registry in either country and to all the benefits thereto appertaining.

Sir Richard Cartwright, in supporting his motion, said:

"I will take two facts alone, which appear to me, and I think will appear to this House, to be of very great importance in this connection; and of which I have here as absolute evidence as it is possible for any man to have. I will take the movement of the population in this country in the last quarter of a century, beginning in the year 1861 and going down to the year 1886, which is the last moment for which I have absolutely accurate statistical information. What are these facts? Sir, they are facts which I state with pain. But I say that we have here incontestable evidence that in these twenty-five years, one in every four of the native-born population of Canada has been compelled to seek a home in a foreign country, and that of all the immigrants whom we have imported at great cost, three out of four have been compelled to follow in the track of that fraction of the native-born population.

"The formal reports of the United States show that in the year 1860 there were 249,000 men of Canadian birth in the United States; that in ten years they had grown to 490,000 souls, and that in 1880, there were 707,000 Canadians in the United States. It must be remembered that that by no means represents the total exodus of our people, because, when you come to deal with such large numbers as these, you must allow for the death-rate which prevailed in the twenty years from 1860 to 1880. That death-rate, after careful examination, I believe to have been about 74,000 in the first decade, and 120,000 in the second, in all equal to 194,000. It is clear, therefore, that between 1860 and 1880, for some cause or other, which it is not my present purpose to analyze, at least 650,000 Canadians found homes in the United States.

"Apply another test. If you choose to turn to the report of Trade and Navigation, which the Minister of Customs with commendable promptitude has laid on the table, there you

will find evidence which ought to convince this House that within the last fourteen or fifteen years, although there has been a considerable increase of population—but far inferior to that we ought to have had—there has been, and it is a noteworthy fact, a very large reduction in the total volume of trade. Here is the honorable gentleman's own blue book laid within these last few days on the table of the House, and from that I see that in 1878, fifteen years ago, the total volume of trade was \$217,500,000, with a population of 3,750,000; that, to-day, with a population which honorable gentlemen opposite estimate, though incorrectly, at 4,800,000, our total volume of trade and exports is \$202,000,000, being \$15,000,000 less than it was fifteen years ago, although we have 1,000,000 people or thereabout more. Apply another test. I find in 1878 the average per head of exports and imports amounted to \$58 odd; according to the honorable gentleman's own statement, the average per head of exports and imports to-day is \$41.50.

In twenty years the Government have trebled our debt, in twenty years they have trebled our taxes, and when the budget comes to be brought down I think the House will find that the liabilities of the people of this country are very far indeed from being fully discharged or measured even by our present enormous debt. Again I say for the moment I suspend my remarks on their failure to create an important interprovincial trade. That is a question which requires a little more discussion than it suits me to give it at the moment; and here again I ask my friends from the maritime provinces, when the time comes, to contribute for the information of the House their views as to the success which has attended our efforts to create a trade in that direction. Nor will I dwell just now further on the lamentable failure after the expenditure of over \$100,000,000 of public money, to produce or obtain any adequate settlement of the Northwest. But I will say a word or two as to the utter failure to obtain any adequate return from our great public works. The public accounts are here, and those public accounts show that the people of Canada have expended well nigh \$200,000,000 in the construction of railways and canals and divers other improvements. Time was when we hoped those would give us something like an adequate return, directly or indirectly, but the time has now arrived when we find these expectations very bitterly disappointed. How now stands the case? I take the public accounts for 1887, and I find, all told, a charge of \$3,970,000 for the expenses of operating those public works, and that is the nominal charge. The real charge, if our accounts were kept as any other country on earth would keep them, would be nearer \$4,500,000, or, at all events, \$4,250,000 than \$3,970,000. What do we get as a return? We get a total income of \$3,270,000. Not only do we not receive one farthing of interest on the outlay

of \$200,000,000, but there is a dead annual loss of \$700,000 a year, not to speak of the various important items which under our most vicious system of book-keeping are charged to capital account.

"What possible available remedies are there for such a state of things? So far as I can see, these remedies are four. In the first place, I think that a very great improvement might be made by reforming our present most oppressive and unjust system of taxation. I say that an immense improvement might be made by so revising our Constitution in the manner which we have pressed from this side of the House time and again, and in the manner which we have seen our friends—not our friends but the friends of the Government—in conference assembled have lately likewise proposed; and by so altering the Constitution that this tyrannical conduct on the part of the Federal authorities toward the rights and privileges of the local legislatures should be put an end to forever. On the other hand, that which is equally important is that this system of bribes, and all those frequent and incessant forays, by various provincial governments on the Dominion treasury, whenever they have been extravagant and got into a scrape, may likewise be put a stop to; and for a third remedy, sir, that this most mischievous railway monopoly which has barred our progress up to the present time, and which has barred the settlement and prosperity of northwestern Manitoba, should likewise be put an end to. But most of all and most important of all, do I believe would be the success in the obtaining of the proposition which I ask the Government to try and obtain in the resolution now in your hands, the obtaining of perfect free trade with the people of the United States. I say, sir, that that is worth all the rest. Give us that, and railway monopolies will cease to vex and harass you; give us that, and the Federal relations will speedily adjust themselves as Federal relations ought to do and as Federal relations were intended to do; give us that, and the sting would be taken out of those tariff combines, more particularly if the United States, as there is now a good hope that it will do, proceeds to emancipate itself from the trade fetters it most foolishly put on. It may be said that this is a heroic remedy. Well, all I can say is that if it be, never in the history of this country, at any rate, was a heroic remedy more needed.

"I contend that for almost everything our farmers have to sell the United States, if only we had free and unrestricted trade with them, would afford us absolutely the best market; and I contend further that, besides being the best market, it is literally the only market for a great many important articles which we produce. See, in spite of all artificial obstacles, how huge a percentage of the total volume of our trade is the volume of our trade with the United States. Out of a total volume of trade of \$202,000,000, the United States supply the trade of

\$88,000,000. Out of \$81,000,000 of exports of our own produce, we sell to the United States, or sold last year over \$86,000,000, or very nearly half. Out of a total of goods entered for consumption of \$105,000,000, we bought \$45,000,000 from the United States. We find that, of 18,779 horses which we sold, the United States bought 18,215. We find that, of 443,000 sheep, the United States bought from us 363,000. We find that, of 116,000 cattle, in spite of all tariff restrictions, they bought from us 45,000 head. Of \$107,000 worth of poultry, the United States bought \$99,000 worth. Of about \$2,000,000 worth of eggs—\$1,825,000, to be accurate—the United States bought all. Of \$593,000 worth of hides, the United States bought \$413,000 worth. Of 527,000 tons of coal, the United States bought 404,000. Of 140,000 tons of gypsum, the United States bought all. Of iron-ore, the United States bought all. Of salt, all that we sold the United States bought from us. Of stone and marble, all that we sold the United States bought from us. In spite of fishery disputes, and taxes I suppose, of \$6,875,000 worth of fish that we sold, the United States was our best customer and bought \$2,717,000 worth. Of \$20,485,000 worth of lumber, the United States bought as nearly as possible half, \$9,853,000 worth. Of 1,416,000 pounds of wool, the United States bought 1,300,000 pounds. Of 9,456,000 bushels of barley, the United States again bought all. Of \$743,000 worth of hay, the United States bought \$670,000. Of \$439,000 worth of potatoes, the United States bought \$328,000. Of \$83,000 worth of general vegetables, they bought \$75,000 worth. Of \$254,000 worth of miscellaneous agricultural products, the United States bought \$249,000 worth, without speaking of innumerable smaller articles, such as apples, flax, and a great variety of other things; and, if the duties were once removed, no one who has ever been in Manitoba and the Northwest but knows that the United States would become by all odds our best customer for a great deal of our high-class wheat. Why, in the mere article of manufactures, the United States, out of a total of \$3,079,000, bought \$1,289,000 worth, and of miscellaneous articles the United States bought \$569,000 worth out of a total of \$644,000. There are two things to which I want to call the attention of all the members of this House. One is that, for very obvious reasons, our exports to the United States are largely undervalued. They do not at all fairly represent the amount we sell. So long as they maintain a high tariff, it is the obvious interest of every Canadian seller to underestimate the value of the articles he has to sell, and, as every one knows, the thing is habitually and constantly done. In another respect it is very important that the House should know that in the case of an enormous number of the articles to which I have called specific attention, there is room for well-nigh unlimited expan-

sion. Given free trade, given unrestricted intercourse, and that trade might assume nearly unlimited proportions in regard to a great many of these articles.

"It has been made a grave ground, it has been attempted to be set up as an insuperable ground of objection, that, when you propose to enter into a treaty for unrestricted trade with the United States, you must thereby, of necessity, discriminate against English manufactures and the manufactures of all other countries except the United States. Now, that is true. I admit that. More than that, I will admit that, *prima facie*, what we propose to-day is a very unusual thing. I will admit—I am in no wise disposed to shrink from any argument which can be fairly advanced—I admit frankly that, when a semi-dependent state, when a colony proposes in one breath to tax the goods of the parent state and admit the goods of a foreign state free, while at the same time the parent state admits our goods and the goods of other countries free, and the foreign state taxes those goods very heavily, it is a very unusual thing indeed. I grant that it is clean against all formulas. I do not deny that. I admit that it appears to be reversing the action of one hundred years ago when England lost half of this continent because she endeavored to tax their goods without giving them representation, and I admit that we are going a little far in taxing her goods and not the goods of the people of the United States. I grant that this needs explanation, and I am prepared to say that I can give a full explanation why in the interests of England itself this thing should be done. I think I have stated the case as strongly as honorable gentlemen can well desire. Now, let us first of all look at the material results which will flow to England should this discrimination take place, and here let me say, what is obvious to every one who has given the subject a second thought, that, in our peculiar geographical position toward the United States, it is perfectly apparent that we can not hope to gain free intercourse and unrestricted reciprocity with them without discriminating against the goods of other countries, unless and until the United States are prepared to go in for free trade with all the world, in which case our proposition would not be necessary. The thing, I grant, is of the essence of the bargain. I am not in the least degree desirous of concealing that fact, but, so far as the material side is concerned, the practical results of assimilating our tariff in certain points to the American tariff as against England have been immensely and, I suspect, purposely exaggerated. In the first place, the House ought to remember that at this very day our tariff is pretty nearly as hostile to English manufactures as that of the United States. Then it is well to bear in mind that, the tariff to the contrary notwithstanding, England has always managed to carry on a large trade with the United States, and especially

with the northern portion of it. There can be no doubt, I think, that if we succeed in getting unrestricted trade we shall become much richer, and if we become much richer there is no doubt that we shall buy a much larger quantity of English goods than we do at present, though perhaps not in the same line. I believe that the result of England giving us a free hand in this matter would be simply to make some little alteration in the character but not in the quantity of the goods she sells.

"I do not say, and it is false to assert that I have ever said, that Canada has not made any progress during the past twenty years. I admit considerable progress has been made in certain directions. But what I contend for now is this, that the progress has been partial, inadequate, far below what the natural resources of our country would warrant. It is also far below what we made ourselves in the twenty years before 1861, and infinitely below what the United States made in the first twenty years of their existence, when their population was equal to ours. I am quite willing to grant that a few towns have grown and prospered within the past few years, but I say it was none the less true that over many wide areas of this country our population is stationary and even retrograde. It is none the less true that from one end of Canada to the other, the value of farm lands is less to-day than it was six, seven, or eight years ago; it is none the less true that the value of farm products is enormously lowered, and that our farmers are exposed to a far more intense competition than they hitherto experienced. Great new forces are coming into existence, the full effect of which we are only beginning to feel. There is danger lest Canada, so far as regards our native-born population, should sink into a mere residuum, a country from which the best and most intelligent of our people are fleeing, not by hundreds or by thousands, but by millions. Then as to foreign immigrants, if these statistics can be relied upon, it is clear that we are becoming a mere dumping-ground for the refuse of those whom we import into this country. No one supposed, when we came together in this Confederation, stretching over half a continent, that we were to remain semi-dependent forever. We are growing in stature, not as fast as honorable gentlemen say, but still we are growing, and we are entitled to a larger measure of responsibilities and to a larger measure of rights. One thing is clear, that every one, as I have said, who thinks twice on the subject knows and feels that things are not satisfactory for us in many ways. I see no way of our becoming a valuable member of a British federation save only on one consideration, and that is that you broaden your base and take care that you unite yourselves with the United States in the bonds of a firm and friendly alliance which is not likely to be broken, and there is no way in which that is more likely to be done than by greatly increasing

and promoting the trade between the two countries."

Hon. Wilfrid Laurier (leader of the Opposition), in supporting Sir Richard Cartwright's motion, said :

"The national policy has not developed our native industry, and has not created the home market for our agricultural products, as we were promised. But the necessity of widening the area of our trade and commerce is so great that we have been looking around in this direction and in the other direction to find new outlets and new channels for our trade. In the debate on the address during the present session, the mover of the address told us with pride that the Government had sent a commissioner to Australia in order to obtain the trade of that country; he told us that they had opened communication with the Argentine Republic in order to establish a trade with that country. What will come of these efforts? What has come of all similar efforts? What has come of our sending commissioners to Brazil, to the West Indies, and to Spain? Nothing, for the very obvious reason that, burdened as we are by our protective tariff, we can not meet free-trade England in those markets; so that the conclusion is inevitable that all the efforts we have made so far to develop our trade and commerce, and to broaden their area, ever since 1867, have been a succession of failures. We are a colony of England, it is true; but we are a colony not by force but by choice; and if we are a colony to-day, it is because we are convinced that at the present day our colonial independence is quite compatible with all kinds of national advancement and material prosperity. If you on the other side pretend that our colonial relation curtails and limits our possibilities, that England would allow us to reach a certain altitude and not go higher, I say you slander England; and if any man were to rise on the other side and tell us that England would be jealous at whatever we could do to improve our condition, I would say that man does not know England; he mistakes the England of to-day for the England of one hundred years ago. I commend to the consideration of these fervent loyalists on the other side, whose mouths are ever full of the word loyalty, the following words spoken by Lord Palmerston twenty years ago in reference to the British North American provinces: 'If these provinces felt themselves strong enough to stand upon their own ground, and if they desire no longer to maintain their connection with us, we should say, "God speed you, and give you the means to maintain yourselves as a nation!"' These are the sentiments of British statesmen. They tell us that whenever we want our political liberty, we are free to have it. But what we ask is not political independence; we want to keep the flag of England over our heads; but we affirm that we are economically independent as we are legislatively independent. Colonies have interests in common with the mother-

land, but colonies have interests of their own also; and to-day we levy a heavy toll on all imports from Great Britain. We have done that not only for the sake of collecting revenue, but also for the purpose of protection, to enable us to manufacture ourselves what we had formerly purchased from England, and to that extent to destroy British trade. There was a time when this would not have been tolerated; there was a time when England would have disallowed such a policy; but now we adopt it as a matter of course; now our policy is never questioned—why? Because England has long ago admitted the principle that colonies have interests of their own, and that it is within their right and power to develop and foster and promote those interests, even to the point of clashing with British interests."

Hon. Mr. Chapleau (Secretary of State), in supporting Mr. Foster's amendment, said :

"On some abstract questions men can dictate to the people, they can state certain opinions and impose them on the people; but on a question of policy like this it is the voice of the people that decides; and the voice of the people is against you. Your statistics may be good, and you may be able to make them prove anything you want, but the only statistics I want are statistics of the sentiments and feelings of the people; and those are against you. The people themselves have their say, and in discussing questions of this kind abstract theories of men have no influence over them. Free trade is in the hearts of the people of England; and why? Because in England after long years, I might say, after centuries, of well-digested, of well-guided, of well-applied protection, the manufacturing genius of the English people has acquired a perfection that can not be surpassed or equalled. Manufacturers in England challenge and defy all competition, and in a country like England, where the largest possibilities of production have been attained, cheap living is the desideratum of the working-classes. Free trade is in the hearts of the people of England, whatever might be the difficulties which at the present moment it might entail on the financial condition of the country. On the other hand, protection is in the hearts of the people of the United States; and why? Is it because the genius for manufacturing industries has not developed there? It has to an immense extent; it has so much that American manufacturers are the rivals of Great Britain in almost all the markets of the world. Why is protection still in the hearts of the people of the United States? It is, and will be so long as there is a productive South, an extensive West, affording opportunities for the activity and intelligence of the sons of workingmen to progress under the protective policy which has done great benefit in the past. But it is still more in the hearts of the people of the United States, because the structure they have built necessarily requires further time to become consolidated so as to be able to defy the

world. Again, why is it in the hearts of the people of the United States? It is because, in their view of developing manufacturing industries, they look to this northern part of the continent as being very soon or in the future, or in the near future, to become one of the accessories of the great republic, not by war, not by coercion, but by the good policy they have impressed upon the minds of their people and which our Government are trying to impress on the minds of the people of this country. Should we not pursue the same course, should we not build up our own prosperity, our own national spirit, and our own nation? We are doing it."

On April 6 the House divided on Mr. Jones's amendment to the amendment, which was negatived by yeas, 67; nays, 124. Hon. Mr. Foster's amendment was carried on the same division reversed.

Partial Reciprocity.—On March 28, the Hon. Peter Mitchell, one of the opponents of the Government, called attention to complaints made in Washington of bad faith on the part of the Dominion Government, in failing to carry out the terms of what is known as the "standing-offer clause" of the customs act of 1879, which reads as follows:

Any or all of the following things, that is to say, animals of all kinds, green fruit, hay, straw, bran, seeds of all kinds, vegetables (including potatoes and other roots), plants, trees, and shrubs, coal and coke, salt, hops, wheat, pease and beans, barley, rye, oats, Indian corn, buckwheat and all other grain, flour of wheat and flour of rye, Indian meal and oatmeal and flour and meal of any other grain, butter, cheese, fish (salted or smoked), lard, tallow, meats (fresh, salted, or smoked), and lumber, may be imported into Canada free of duty, or at a less rate of duty than is provided by this act, upon the proclamation of the Governor in Council, which may be issued whenever it appears to his satisfaction that similar articles from Canada may be imported into the United States free of duty, or at a rate of duty not exceeding that payable on the same under such proclamation when imported into Canada.

Certain of these articles have been put upon the free list by Congress, but the Canadian Government has failed to reciprocate in accordance with the terms of the clause. Sir John Macdonald insisted that the clause was permissive and not obligatory, and that the Canadian free list was much more liberal than the American free list. The Premier also took the ground that it was not in the interest of certain classes of Canadians to put the clause into operation. On April 4, the debate being resumed, Sir Charles Tupper declared the policy of the Government to be to obtain a free interchange of the natural products of the two countries, and said that all the articles to which the attention of the Government had been drawn by the United States Government as having been placed on the American free list would be put upon the Canadian free list.

An act was passed repealing section 9 of the customs act, and substituting the following clause:

Any or all of the following things, that is to say, animals of all kinds, hay, straw, vegetables (including potatoes and other roots), salt, pease, beans, barley, malt, rye, oats, buckwheat, flour of rye, oatmeal, buckwheat-flour, butter, cheese, fish of all kinds, fish-oil, products of fish and of all other creatures living in the water, fresh meats, poultry, stone or marble in its crude or unwrought state, lime, gypsum or plaster of Paris (ground, unground, or calcined), hewed or wrought or unwrought burr and grindstones, and timber and lumber of all kinds unmanufactured in whole or in part, including shingles, clapboards, and wood-pulp, may be imported into Canada free of duty, or at a less rate of duty than is provided for by any act at the time in force, upon proclamation of the Governor-General, which may be issued whenever it appears to his satisfaction that similar articles from Canada may be imported into the United States free of duty, or at a rate of duty not exceeding that payable on the same under such proclamation when imported into Canada.

Bucket-Shop Gambling.—One of the most interesting acts passed at this session was that introduced by the Hon. Senator Abbott, a member of the Government and Mayor of Montreal, respecting "Gaming in Stocks and Merchandise." Great efforts were made in behalf of certain "bucket-shops" to defeat this measure, and it was claimed that the proverbial coach-and-four could be driven through this, or indeed any act that could be framed for the suppression of what is commonly called "bucket-shop" gambling. But several convictions were secured under the act. The penalty prescribed is imprisonment for any term not exceeding five years, and a fine not exceeding \$500.

Temperance.—On motion to go into supply, Hon. Mr. Mills (Liberal) moved an amendment:

That, in the opinion of this House, it is the duty of the ministry to submit to Parliament a measure embracing such provisions as will remove all legal impediments to the efficient working of the Canada Temperance Act.

Sir John Macdonald denied the existence of any impediment to the workings of the act.

The object of the motion was simply to force the Government to adopt a policy on the temperance question. This the Government, as a Government, has always declined to do, members of the Cabinet voting, according to their individual inclinations, for or against temperance legislation. The amendment was negatived by 57 yeas to 109 nays.

Ship-Channel.—The progress of the port of Montreal has been seriously hampered by the heavy tonnage-dues levied on shipping by the Harbor Commission to meet the interest on the amount advanced by the Dominion Government for the widening and deepening of the ship-channel in Lake St. Peter and the river St. Lawrence between Montreal and Quebec. This year the Government agreed to assume the debt, and an act was passed releasing the Harbor Commission from the obligation to pay either interest or principal of the debt, and authorizing the Government to expend in completing the channel any sums remaining unexpended of those authorized to be advanced to

the Harbor Commission for the work. The condition on which the debt is assumed is, that hereafter no tonnage-dues are to be levied upon shipping at the port of Montreal.

A similar act was passed making the graving-dock at Lévis, opposite Quebec, a public work, and assuming the debt of the Quebec Harbor Commission.

Public Acts.—The following public acts, which are not referred to in detail, were passed :

Authorizing a loan of \$25,000,000, to pay the floating debt and to carry on public works.

Granting certain railway subsidies.

Extending the time for the completion of the Chignecto Marine Transport Railway.

Imposing regulations on the Auditor-General.

Restricting the rate of interest payable in the Post-Office and Government savings-banks to a maximum of 4 per cent., the actual rate to be prescribed from time to time by the Governor-General in Council.

Continuing the existing voters-lists until the completion of the revision in 1889 under the Electoral-Franchise act.

Providing for the holding of elections in the Northwest Territories on the same day as in other parts of Canada.

Providing rules for civil-service examinations, and for inquiries as to irregularities at examinations.

Providing for the employment of clerks in the office of the High Commissioner.

Making regulations for the Department of Public Printing and Stationery.

Authorizing the appointment of a Deputy Commissioner of Patents.

Providing for a Legislature for the Northwest Territories.

Amending the Territories Real Property act.

Vesting certain powers in the crofters' colonization commissioners to be appointed.

Amending the Indian act.

To regulate the licensing of international and inter-provincial ferries.

Amending the adulteration act.

Amending the weights-and-measures act as regards the contents of packages of salt. Every barrel of salt offered for sale to contain 280 pounds of salt, and to have the gross and net weight permanently marked on the barrel.

Amending the steamboat-inspection act.

Amending the banking act by providing that whenever a person granting a warehouse receipt or bill of lading, and carrying on certain businesses, is also the owner of the goods mentioned in the receipt, such receipt and the right and title of the bank to the goods shall be as valid as though the person making the receipt and the owner of the goods were different persons.

Authorizing any insurance company incorporated by the Legislature of the late Province of Canada, or by any of the Provincial Legislatures, to avail itself of the provisions of the Insurance act.

Assenting to the Treaty of Washington, 1888.

Ratifying the International Convention for the Preservation of Submarine Telegraph Cables.

To remove doubts respecting the laws of England, as they existed on July, 15, 1870, being in force in Manitoba.

Respecting defective letters patent.

To amend the Supreme and Exchequer Courts act.

To authorize the appointment of a new puisne judge at Montreal or Quebec.

To extend the jurisdiction of the Maritime Court of Ontario.

Prohibiting the advertising of counterfeit money.

Enacting that there shall be no appeal in criminal cases to any court in the United Kingdom.

Providing that publishers and editors shall only be

tried for libel in the provinces in which they reside or publish their papers.

Amending the Summary Convictions act.

Amending the act respecting Punishments, Pardons, and the Commutation of Sentences.

Amending the Dominion Elections act.

Imposing new customs regulations.

Altering excise duties.

The railway act.

Ratifying an agreement between the Government and the Canadian Pacific Railway Company, by which the latter relinquishes its monopoly privileges in Manitoba, and the Government guarantees the interest on the company's bonds at 8½ per cent. to the extent of fifteen million dollars.

Two acts amending the Canada Temperance act.

Imposing severe penalties for the use of fraudulent marks on merchandise, imitation of trade-marks, etc.

The St. Lawrence Canal.—In 1816 a joint commission of both Houses of Parliament of Upper Canada reported on the subject of connecting Lake Erie and Lake Ontario. In 1821 a commission was appointed to consider the subject, and two years later it reported in favor of constructing the Welland Canal of such dimensions as would accommodate the class of vessels then navigating the lakes. The result of this report was the incorporation of the Welland Canal Company, which proposed to establish the necessary communication by a canal and railway. The work was begun in 1825 (the year in which the Erie Canal was finished and opened), and was completed in 1829. In that year two schooners, one of eighty-five tons, ascended the canal from Lake Ontario to the Welland river. Subsequently the main line of the canal was extended over the Welland river to Port Colborne. In 1851 the Government approved this project and granted a loan of \$200,000; and the work was completed in 1853. In 1873 a new enlargement was begun, making the locks 270 feet long, 45 feet wide, and 12 feet deep. From Allanburg to Port Dalhousie, 11 miles, a new canal was built; and since that time the old canal, although kept in repair and well maintained, has been chiefly used as a water-power. But even with 12 feet of water the canal was not deep enough. Grain-laden vessels at Port Colborne had to lighter much of their cargoes to the Welland Railroad, which hauled the grain to Port Dalhousie, where it was again loaded, and the cost of this lighterage was a great drain on the income of the canal. It was decided to give the canal for its entire length a draught of 14 feet, not by dredging, but by building up the locks and banks 30 inches higher. Up to the time this work was begun the Welland Canal had cost about \$18,000,000. The total expenditures upon this canal down to June 30, 1887 (when the enlargement had been completed), were \$23,062,615. As soon as the latest improvements had been made, it was apparent that the vast expenditure on the Welland Canal must remain of little direct benefit until the St. Lawrence canals were made of corresponding capacity. There has been no profit in carrying grain to Kingston for transshipment to Montreal by the barge lines. The cost of handling at

Kingston, and transshipment, practically destroyed the natural advantages of the Canadian route. But the appropriation now made by the Canadian Government to deepen the St. Lawrence canals to fourteen feet will enable the majority of lake vessels to engage cargoes at Duluth, Chicago, or other ports of the upper lakes, and bring their loads through to Montreal or the Atlantic Ocean without breaking cargo. Therefore, the Government of the Dominion of Canada began the work of deepening what are known as the St. Lawrence canals, or the artificial ways that make navigation possible around the rapids and shallow waters that abound in the St. Lawrence river between Ogdensburg and Montreal. In 1841, when the system of canals between Montreal and Lake Ontario was designed, it was in contemplation to afford a depth, at all stages of the St. Lawrence waters, of nine feet. But the St. Lawrence, from various causes, is subject to fluctuations, the extent of which it was impossible, when those canals were constructed, to arrive at with precision, and the observations and experience of subsequent years have shown that while the intermediate river reaches at all times afford ample depth for vessels of nine feet draught, in the canals themselves, at certain periods of low water, this depth can not be maintained, the bottom not having been sunk enough. In 1871 it was decided to enlarge the canals on the St. Lawrence route, so as to afford a navigable depth of twelve feet throughout. Subsequently it was decided that the depth should ultimately be increased so as to accommodate vessels of fourteen feet draught; and accordingly in the scheme of enlargement that has so far been carried out, a channel in the canals is provided for vessels drawing twelve feet only, while all permanent structures, locks, bridges, etc., are being built of such proportions as to accommodate vessels of fourteen feet draught, the locks being 270 feet long between the gates, and 45 feet in width, with a clear depth of 14 feet of water on the sills. The lower of the St. Lawrence canals is the Lachine. This canal extends from Montreal to the village of Lachine, overcoming the Lachine Rapids, the first of the series of rapids that bars the ascent of the river. The full scheme for the enlargement of this, in common with the other canals of the St. Lawrence, contemplated affording a navigable depth of fourteen feet throughout; but the improvement immediately in view was only intended to furnish a navigable depth of twelve feet in the canal proper; and accordingly on the reaches between Lachine and Côte St. Paul, between Côte St. Paul and St. Gabriel, and between St. Gabriel and Wellington Basin, the channel has been adapted to navigation by vessels of twelve feet draught only. All permanent works on the canal have been built to afford a navigable depth of fourteen feet. The total rise of lockage is 45 feet, and the number of locks is five. The Beauharnois

Canal, which is the next in order up the stream, begins on the south side of the St. Lawrence, 15½ miles from the head of the Lachine Canal. It connects Lakes St. Louis and St. Francis, and passes the three rapids known respectively as the Cascades, the Cédars, and the Coteau. The locks are 200 feet by 45 feet. The total rise is 82½ feet; and the number of locks is nine. The depth of water on the sills is 12 feet. Nothing has been done toward the enlargement of the canal. Still proceeding up the channel of the river from the head of the Beauharnois to the foot of the Cornwall Canal, there is a navigable stretch through Lake St. Francis of 82½ miles. The Cornwall Canal extends past the Long Sault Rapids. Two locks at the new lower entrance (taking the place of three on the old line), were in constant use during the season of navigation. The dimensions of the new locks are those of the general enlargement scheme. The basin between these two locks is 825 feet long. Of the four locks still to be dealt with, one is already under contract, together with works for the improvement of the upper entrance, and arrangements are being made for further works either on the summit level or above the town of Cornwall. The proposed channel will be sunk to such depth as to admit of the passage of vessels of fourteen feet draught. The total rise is 48 feet. The highest grade of canals is known by the name of Williamsburg; which includes the Farran's Point, Rapide Plat, and Galops Canals. Much trouble has been experienced in this group of canals, owing to low water. The Farran's Point Canal is three quarters of a mile long, with one lock, the navigable depth being nine feet. No work has been done at this point. The Rapide Plat Canal is 4 miles long, with two locks, each 200 feet by 45. The total rise is 11½ feet and the depth of water on the sills is nine feet. One of the two new locks is practically completed, giving a depth for navigation of fourteen feet. The new works include the enlargement of the channel above and for some distance below the present guard-lock at the head of the canal, and the construction of a new lock and a supply-weir in connection with the old lock. The bottom of the channel, for a distance of about one thousand feet below, and out into deep water, above the lock, about seven hundred feet, will be excavated to afford a navigable depth of fourteen feet. The Galops Canal enables vessels to overcome the rapids at Pointe Aux Iroquois, Pointe Cardinal, and the Galops. The work under contract is the excavation and deepening of a channel at the upper end leading to deep water, so as to give a depth available for vessels of fourteen feet draught. The work is practically completed, and access to this canal is found to be greatly facilitated. Preparations are being made with a view to extend the fourteen-foot navigation down to deep water below the rapids, and to place a guard-lock at that point.

The Galops Rapids, about seven miles below Prescott, the most shallow of the three passed by the Galops Canal, are being improved by certain works of sub-marine blasting and dredging, begun in 1880. These consist of the excavation of a straight channel through the rapids, 3,300 feet long, 200 feet wide, and of such depth as to afford safe passage at low water to vessels of fourteen feet draught. This implies affording a depth of seventeen feet of water. The whole of the work of drilling and blasting is completed, but the broken rock has to be removed by the dredging-machine, and this work is in progress. It is one of considerable difficulty, owing to the rapidity of the current and the necessity of avoiding interruption to navigation. Above the Galops Rapids there is unobstructed navigation to the foot of the Welland Canal at the head of Lake Ontario. Much anxiety has been expressed at the various ports on Lake Ontario, over the fact that such an increased volume of water would pass over the Galops Rapids, owing to the heavy blasting at that point, and also through the enlarged St. Lawrence canals. Should the quantity of water be largely increased, it is thought that the depth in the several ports of Lake Ontario may be considerably reduced, to the great injury of the respective cities belonging to such ports. As a part of the scheme for enlarging the waterways through Canada, the great work of deepening the channel of the St. Lawrence river,

from Montreal to Quebec, was completed in 1888. This work was first agitated over sixty years ago, and was begun in 1844; and the result is that where there was formerly only eleven feet of water there is now twenty-seven and a half feet, and large ocean steamers can enter the docks at Montreal, six hundred miles from the mouth of the St. Lawrence. There are now twenty-two lines of ocean steamers that sail to and from Montreal. Engineers say that the commerce of a port increases according to the cube of the increase in the depth of the channel, and statistics show that this law of increase has been fulfilled at Montreal as the channel has been gradually deepened. Some idea of the magnitude of the work which has been done can be gained from the fact that in Lake St. Peter, eight million cubic yards of clay were removed, an amount of excavating equal to what was done in building eight hundred miles of the Canadian Pacific Railroad. In some places solid rock has been "scooped out" to a depth of several feet, and altogether it was quite fitting that the engineers in charge, and the Montreal, Provincial, and Dominion governments should rejoice together over what has been accomplished. Montreal now has a population of 250,000, and with her deep-water outlet on the one side, and the Canadian Pacific Railroad on the other, she looks hopefully to the future, and pictures for herself a day when she shall have many times her present population and commerce.

E

ECUADOR, an independent republic in South America, covering an area on the mainland of 643,295 square kilometres, while the Galápagos Islands measure 7,643 square kilometres. According to the census taken in 1885, the population was distributed as follows:

PROVINCES.	Inhabitants.	Capitals.	Inhabitants.
Oarehí	29,383	Tulcan	4,000
Imbabura	56,476	Ibarra	10,000
Pichincha	187,844	Quito	80,000
Leon	80,028	Latacunga	15,000
Tungurahua	79,526	Ambato	12,000
Chimborazo	90,783	Riobamba	18,000
Bolívar	81,827	Guaranda	6,000
Elios	32,041	Babahoyo	5,000
Oriente	15,850
Guayas	95,640	Guayaquil	40,000
Manabí	64,284	Portonlejo	10,000

Total	1,004,651	252,000

The population given in detail above does not include the wild Indians of the eastern provinces and eastern slopes of the Andes, supposed to number in the aggregate some 600,000 souls.

Government.—The President is Dr. Antonio Flores, whose term of office will expire on June 30, 1892. His Cabinet was composed as follows: Interior and Foreign Affairs, Gen. Don Francisco J. Salazar; Public Instruction, Worship, and Charity, Don Elias Laao; Finance, Don José Toribio Noboa; War and Navy, Gen. Sáenz. The Consul of Ecuador at Washington is the Marquis de Chambrun; the Consul-General at New York, Don Domingo L. Ruiz; and the Consul at Philadelphia, Edward Shippen. The American Consul-General at Guayaquil is Owen McGarr.

Finance.—According to the statement made by the Minister of Finance, the indebtedness was \$13,196,095 capital and \$1,152,487 interest due thereon on June 10, 1887, constituting an aggregate debt of \$14,848,582. This includes the sterling debt, the principal of which is £1,824,000, and the accumulated unpaid interest was £373,920 on June 10, 1888, thus increasing the amount due in Europe to £2,197,920. This sterling debt had its origin at the time Colombia was dissolved into three independent states, viz., New Granada (now called Colombia), Venezuela, and Ecuador, in 1830, and represents the portion of the old Colom-

bian debt assumed by Ecuador. Up to the year 1867 the interest was regularly paid on it, but since then it is in default, although the bondholders were content to receive only 1 per cent. per annum till the customs receipts at Guayaquil should begin to exceed \$400,000 per annum, 25 per cent. of the surplus to go toward increasing the interest till it reached 6 per cent. Although since the pacification of the country the customs receipts at Guayaquil have swelled to an amount warranting 4½ per cent. per annum on the sterling debt, this clause of the engagement has not been enforced hitherto, for political reasons; but since the accession to power of Dr. Antonio Flores, the new President, matters are taking a turn more favorable to the bondholders. Thus the Executive issued, under date of September 10, a decree inviting the council of foreign bondholders to appoint a commissioner with full power to negotiate with the Government a reorganization of the debt on a mutually acceptable basis. The outstanding internal and external indebtedness is trifling, considering the resources of the country, which requires the carrying out of public works, notably railroads, all of which would be facilitated by an upright, prompt financial policy. In response to the decree named, the council of bondholders in London will delegate one of its members to go to Quito and arrange matters if possible. The actual income of the state in 1886 was \$5,107,992, and sufficed to meet the outlay.

In April, 1888, the Bank of Ecuador advanced the Government \$900,000 at 9 per cent. interest per annum, the net income of the Guayaquil custom-house being pledged. Banks are in a flourishing condition. Thus, the Bank of Ecuador declared 20 per cent. dividend in 1886 and in 1887, the International Bank respectively 10 and 12 per cent., the Anglo-Ecuadorian 8 and 12, and the Banco Hipotecario 15½ and 16 per cent.

Army.—The strength of the regular army in 1888 was 4,780 file, 3,320 thereof being foot, 1,060 artillery, and 350 horse; there being four battalions of infantry, two companies of artillery, and one regiment of cavalry, all fully armed and equipped, and the arsenals at Guayaquil and Quito well stocked with ammunition and everything necessary, in addition to which there were ordered from the United States 700 Remington rifles, and 100,000 cartridges.

The National Guard was composed, in 1888, of 76 battalions, 68 being foot, 2 artillery, and 6 horse, completely organized.

Navy.—In 1887 Ecuador had only two men-of-war, the "Cotopaxi" and the "Nueve de Julio"; both are steamers, the former having cost £11,500, and the latter £19,300. They are new, unexceptionable in every respect. In January, 1888, the new gun-boat "Tungurahua" arrived from England.

Treaty.—Prior to his return from Europe Dr. Antonio Flores, then President-elect of Ecuador, but at the time still minister at Paris,

negotiated a new treaty of commerce and navigation between his country and France, together with a consular convention, to take the place of the treaty concluded at Quito on June 6, 1848. The new treaty is to remain operative to February, 1892, and the consular convention for ten years, dating from May 12, 1888, when both agreements were signed. A separate agreement covered literary, artistic, and industrial property, guaranteeing it to citizens of either country.

Railroads.—On March 27, 1888, a company was incorporated at Guayaquil, having for its object the construction of railroads and other public works in the republic. It acquired by purchase from the original contractor, Mark J. Kelly, the control over the Yaguachi-Duran railway, then about finished, together with that of the line from Yaguachi to Chimbo, and the one from Chimbo to Sibambe, both in course of construction. The company will issue 8-per-cent. bonds, the interest to be paid out of the salt monopoly secured, the first bond issue being subscribed for beforehand.

Commerce.—The exports in 1886 amounted to \$8,014,409, including \$408,988 specie and bullion, and 37,172,576 pounds of cocoa, worth \$6,505,201; 2,978,346 pounds of coffee, worth \$321,121; India-rubber, \$282,897; hides, \$280,055; vegetable ivory, \$89,020; straw hats, \$23,680, the rest being made up by oranges, pine-apples, and quinine-bark. The American trade presents the following figures:

FISCAL YEAR.	Import into the United States.	Domestic export to Ecuador.
1887.....	\$1,181,169	\$1,049,892
1888.....	1,118,927	810,567

The number of vessels that entered Ecuadorian ports in 1886 was 376, of which 185 entered at Guayaquil alone (117 thereof being steamers), without counting small coasters.

Partial Tariff Modifications.—Dating from Jan. 1, 1888, the following changes in the rates of import duties became operative: Almanacho and green plants to enter duty free; an additional cent per kilogramme to be laid on potatoes, rice, large stoneware vessels, timber, and lumber; two cents additional per kilogramme on soda for washing, hand-pumps, iron and steel rails and sleepers, iron tubes less than 0.12 metre in diameter if forming part of machinery, dye-woods, printing-paper; ten cents per kilogramme: crude stearine, fancy water-mugs, twine for sewing bags, marble; fifty cents per kilogramme: imitation silver or gold plated jewelry, hats, caps; one dollar per kilogramme: all other jewelry.

Cocoa.—There arrived at Guayaquil from the interior for shipment abroad, in 1887, 334,267 quintals of cocoa, against 384,752 in 1886; 244,724 in 1885, and 176,955 in 1884. From Jan. 1 to Oct. 23, 1888, 254,000 quintals were received at Guayaquil, against 305,000 in 1887.

Ivory-Nuts.—There had been shipped abroad from Guayaquil, in 1887, 258,125 quintals of

ivory-nuts, against 197,808 in 1886, 169,000 in 1885, and 107,759 in 1884.

Earthquakes.—On September 25 a sharp shock of earthquake was felt at Elena at eight o'clock in the evening, and simultaneously at Guayaquil, lasting about two minutes. The shocks were followed by flashes of lightning. At that time of year lightning has been unknown heretofore in the localities named. Another very heavy shock was experienced at Guayaquil on November 16, at twenty-five minutes to three P. M.; the people fled from their houses thoroughly panic-stricken.

Benedictine Monks for Ecuador.—On July 20 seven Benedictines from St. Mary's Abbey, Newark, N. J., left New York for Ecuador, to establish a church in the republic. Three of them were Americans and four Germans, the latter, however, being citizens of the United States. They took with them a large quantity of the most improved farm and garden implements, the whole forming three wagon-loads of cases, more machinery and tools to be sent for as the occasion may demand. They emigrated to Ecuador at the solicitation of the bishop of that country.

EGYPT, a principality in Northern Africa, tributary to Turkey. The reigning sovereign, called the Khedive, is Mohammed Tewfik, born Nov. 19, 1852, who succeeded to the throne on the abdication of his father, the Khedive Ismail, June 26, 1879. He is the sixth ruler of the dynasty of Mehemet Ali, who was appointed Governor of Egypt in 1806. The administration of Egypt is carried on by native ministers, subject to the rulings of the Khedive, and under the supervision of England. There is a legislative council of thirty members, of whom sixteen are elected and fourteen appointed by the Khedive, but it has only advisory powers.

Area and Population.—The area of Egypt proper, the southern boundary of which was provisionally fixed at Wady Halfa, about 800 miles south of Cairo, in January, 1887, is estimated at 11,000 square miles. The country is divided into El Said or Upper Egypt and Masr-el-Bahri or Lower Egypt. The population in 1882 was 6,806,881, composed of 6,715,495 Egyptians and 90,886 foreigners. Of the Egyptians, 6,469,716 had fixed abodes and 245,779 were nomads. The bulk of the foreigners are Greeks, Italians, French, Austrians, English, and Germans. Ninety per cent. of the foreign population reside in Lower Egypt. The average annual increase in the population since 1846 has been 1.25 per cent. The inhabitable land in Egypt comprises 6,216,530 acres, of which 8,745,971 acres are in Lower and 2,470,559 acres in Upper Egypt.

Commerce.—The total exterior commerce of Egypt for 1886 amounted to 17,977,851 Egyptian pounds, in which sum the imports are represented by 7,848,231 pounds, and the exports by 10,129,620 pounds. The imports of specie for the same year were 1,888,797 pounds, and the exports, 2,972,520 pounds. The commer-

cial intercourse with different foreign countries for 1886 was as follows, the value being given in Egyptian pounds (£E1=\$5):

COUNTRIES.	Exports to—	Imports from—	Total.
Great Britain	6,418,969	8,068,690	9,481,659
Turkey	365,250	1,808,443	1,666,692
France and Algeria	904,767	888,010	1,799,777
Austria	598,048	909,528	1,507,576
Italy	591,792	370,488	862,900
Russia	1,045,580	445,289	1,490,869
India, China, etc.	8,923	481,059	492,482
Greece	87,412	50,046	137,458
America	31,356	62,565	93,921
Other countries	141,578	894,144	466,017
Total	10,129,620	7,848,231	17,977,851

The values of the principal articles of commerce for the year 1886 were, in Egyptian pounds, as follow:

EXPORTS.	Value.	IMPORTS.	Value.
Cotton	7,120,812	Cotton goods	1,473,276
Cotton-seed	1,281,948	Coal	864,296
Beans	467,952	Clothing	1,045,000
Wheat	78,912	Indigo	180,160
Sugar	453,317	Timber	890,000
Lentils	18,428	Wines and spirits ..	868,114
Skins	116,558	Coffee	175,086
Rice	106,808	Tobacco	244,268
Gum	14,359	Refined sugar	112,921
Maize	1,565	Machinery	132,008
Wool	65,868	Wheat	205,110

The increase in the tobacco receipts for the year 1886 was £80,000, due to the introduction of Greek tobacco under the new commercial treaty.

The decrease in the value of the imports for 1886 from those of 1885, was 1,140,811 Egyptian pounds, and the decrease in the value of the exports was 1,295,350 pounds.

Agriculture.—The report of the statistical bureau in Cairo for 1887 makes the cultivated area 4,961,462 feddans, showing an increase of 247,056 feddans in three years. The area planted to cotton was 874,645 feddans in 1886, 865,526 in 1887, and 1,057,518 in 1888. The cotton product in 1887 was 3,025,965 cantars, or 378,245,000 pounds. The cultivation of cotton is extending rapidly in Upper Egypt, where the fellahs find it a more profitable crop, and one requiring less care and outlay, than sugar-cane. The cultivation of bersim, a kind of clover, occupied 941,222 feddans in 1888, and there were 617,605 feddans in Lower and 623,495 in Upper Egypt under wheat. Although sugar culture is declining, the product in 1887 was 1,090,424 cantars, worth 573,859 Egyptian pounds, inclusive of the rum and molasses products. The chief crops of lesser importance are beans, lentils, Indian corn, oats, rice, and durra. The farm animals have greatly decreased, owing to contagious diseases and the impoverishment of the people. There are at present, to every 100 feddans or acres, 9 buffaloes, 5 animals of other kinds, including camels, horses, asses, mules, and cattle, and 20 sheep.

Railways, Telegraphs, and Posts.—In 1886 there were 900 miles of railway in operation. The

telegraph lines belonging to the Government at the end of 1887 had a total length of 8,172 miles. The Government has established a telephone line 140 miles long, extending from Cairo to the petroleum-wells on the Red Sea, consisting of a bare iron wire, running along the sand without poles or insulators.

The post-office carried 7,620,000 inland and 5,075,000 foreign letters during 1886. In 1887 the number of internal letters was 8,174,000, and the total correspondence 12,916,000.

The Suez Canal.—The number of vessels that passed through the Suez Canal in 1886 was 3,100, with a gross tonnage of 8,183,318. Of these 2,381, of 6,264,417 tons, were British; 227, of 699,194 tons, French; 161, of 314,715 tons, German; 127, of 312,964 tons, Dutch; 77, of 191,383 tons, Austrian; 69, of 184,960 tons, Italian; 25, of 88,076 tons, Spanish; 24, of 58,288 tons, Russian; 28, of 47,991 tons, Norwegian; 6, of 3,368 tons, Turkish; 4, of 3,056 tons, Egyptian; and 1, of 1,292 tons, Belgian. The deepening of the canal to 8½ metres has been completed.

The gross receipts of the company in 1886 were £2,241,095, as compared with £2,601,998 in 1885; £2,576,083 in 1884; £2,645,506 in 1883; and £2,536,843 in 1882. The net profits in 1885 were £1,861,150, yielding a dividend to the shareholders, after providing for the sinking-fund, of 17·08 per cent. The statutes provide that of all net earnings over 5 per cent., 71 per cent. shall go to the general shareholders, 15 per cent. to the Egyptian Government, 10 per cent. to the founders' shares, 2 per cent. to the employés, and 2 per cent. to the managing directors. Of the 395,840 shares that were issued, 176,602 were taken by the Khedive of Egypt, and were by him transferred to the British Government in 1875 for the sum of £3,976,582. The dividends on these shares up to the year 1894 he had already alienated, signing them over to the Suez Canal Company. The share capital of the canal amounts to 197,920,000 francs, and the bonded debt of various descriptions to 177,292,426 francs.

A convention defining the status of the Suez Canal was arranged in the early part of 1888 between Great Britain, France, and Turkey, and agreed to by all the powers. Turkey obtained modifications giving her the presidency at the annual meetings and permitting the transportation at all times of troops to the eastern shore of the Red Sea. When the time came to ratify the convention, the Porte asked permission to add an explanatory protocol denying the view expressed by the Italian Government as to its bearing on the dispute between Turkey and Italy with regard to Massowah and other Italian posts on the African Red Sea coast, but the powers would not assent to the Turkish view. The convention was finally signed at the Porte on October 29. The first three articles are devoted to the subjects of the neutrality of the canal and the security of the works and material of the company, and

the next four to the position of belligerents in the canal and its ports of access. The canal is declared free for the transportation of war material and the passage of ships of war in war times as well as in times of peace. The eighth article specifies the duties of foreign diplomatic agents in Egypt, and confers on the Porte the presidency at the annual meetings. The ninth and tenth articles establish the responsibility of the Khedive, and define the conditions under which he will have to appeal to the Sultan and the right of Turkey to provide for the defense of the eastern coast of the Red Sea. The next three articles sanction the territorial rights of Turkey and the sovereign prerogatives of the Sultan and of the Khedive outside of the obligations of the treaty. The remaining articles declare that the treaty is not limited to the duration of the Suez Canal concessions, and provide for the exchange of ratifications within a month of the date of signature.

Finance.—The English have been unable to ingraft on Egypt the Indian methods of administration, and have been compelled to abandon their efforts to govern the people in their own way. Their general direction of the internal policy of the Central Government has resulted in important reforms, yet these have failed to win the affection of the people, and have been attended with increased burdens. English reformers have improved the irrigation works, abolished the *corvée*, reformed the prisons, and to a large extent done away with arbitrary imprisonment and the use of the *kourbash*, and have introduced ameliorations in the railroad service and throughout the judicial and civil administration; and yet anarchy and impoverishment are worse than ever before, and the financial situation is still critical, although there has been an improvement of public credit, as compared with the period of bankruptcy and disorganization that followed the burning of Alexandria and the British war of occupation. During 1882 and 1883 a floating debt of nearly £6,000,000 was contracted. The debt in 1884 stood at £101,000,000. Since then it has grown to £108,028,000, but nearly the whole of the increase was still available in the beginning of 1888, when there remained unexpended of the international loan £1,251,000, with a cash reserve of £415,000 in the coffers of the Caisse de la Dette, and £76,000 of cash in the Government treasury. Excepting more rigorous exactions of the land or irrigation taxes, the only increase of taxation in four years have been taxes on Europeans previously exempt and an increase in the tobacco duties. The annual interest on the debt, amounting to £4,250,000, has been paid without any deduction from the coupon. The interest payable abroad, with the Turkish tribute of nearly £700,000, makes a sum of £4,750,000 that the country has to provide annually to meet foreign claims. The average gross value of the exports of cotton, sugar, beans, and wheat between 1880 and 1884 was £11,367,000 per annum, not counting the

war year of 1882. In 1885 and 1886, owing to a fall in prices, the value was only £9,986,500 per annum.

The accounts of the treasury are full of arbitrary changes, adopted for the purpose of showing each year a favorable result. The revenue for 1887 is given as £8,010,749, against £7,896,654 in 1886, and £7,980,238 in 1885. The expenditure is said to have amounted to £7,987,067, against £8,039,980 in 1886, and £7,834,379 in 1885. This shows a surplus of £23,682 in 1887, as compared with a deficit of £143,326 in 1886, and a surplus of £145,854 in 1885. The deficit in 1886 is accounted for by the expenditure for *corvée* abolition and diminished railroad receipts. There were, however, in that year extraordinary and non-recurring receipts, under a new law granting perpetual exemption from military service, amounting to £249,900, whereas the payments for temporary exemption in the previous year were only £17,800. The revenue for 1885 was swelled to a nearly equal amount by abnormal railroad receipts paid for the transportation of English troops. The *corvée* charge was continued in 1887; but the deficit was changed into a surplus by manipulation of the accounts in transferring the estimated deficit in the receipts of the domains and Daira administrations, which is £140,000 and the salaries of employés of the Government for the last month of the year, amounting to £200,000, to the budget of 1888. This jugglery was necessary to avoid a deficit, notwithstanding the new tax on foreigners, which yielded £65,000, and that on tobacco-culture, producing £8,000. The revenue from direct taxes in 1887 was £5,468,931; from indirect taxes, £1,545,950; from remunerative administrations, £884,095; and from other sources, £111,773. The receipts from the land-tax in 1887 show a slight increase, owing to an extension of the cultivated area. In years of a good Nile a continued improvement can be counted on in the future, owing to the public works that the English have constructed. But in 1888 they have had, for the first time, to confront a situation caused by a bad Nile and, at the same time, an increase in military expenditures, due to their selfish and mistaken policy on the Red Sea coast.

The expenditure for 1887 under the different heads was as follows: Debt and tribute, £4,899,220; civil list and pensions, £701,318; remunerative expenditure, £698,275; public security, £652,843; administration, £753,219. Under the head of remunerative expenditure is included the item of £32,374 for the fruitless search for petroleum on the coast of the Red Sea, in which enterprise the Government has sunk £169,164 altogether. A comparison with former years shows some saving in administrative expenses, due to economies, and a reduction in the civil list and pensions, owing to the commutation of pensions.

The budget estimates for 1888 make the net revenue £8,126,661, and the expenditure

£8,102,661. A reduction in the price of military exemption was expected to increase the revenue from this source by £150,000. The troubles in the Soudan have led to an increase in the army and gendarmerie, which had been reduced in order to lighten the expenses. The final estimate of the results of the low Nile is that 260,000 acres between Cairo and Assouan will be thrown out of cultivation, causing a loss of revenue for 1889 of £300,000. The loss to the country will amount to more than £1,000,000.

The Egyptian convention placed to the credit of the Government, to be expended for certain specified extraordinary purposes, the sum of £10,129,074, being the proceeds of the international guaranteed loan of £9,000,000 and of the sales of Government lands and old material and the recovery of arrears. Of this total, £4,143,956 were paid out for Alexandria indemnities, £100,000 for a court-house and custom-house, and £78,118 for the emission of the loan. Of £2,757,000 that were appropriated to covering past deficits, there remained £73,680 unexpended at the close of 1887. Of £1,000,000 that were assigned to the Soudan to meet the cost of evacuation, there had been paid out £884,182, and out of an equal sum set aside for irrigation works the expenditures had been £479,715. Of the fund assigned to the commutation of pensions, only £41,162 remained, so that the saving in the ordinary budget under this head ceased with 1887. The total balance remaining from the extraordinary fund was £1,250,945, including £500,000 that is held as a reserve for general treasury purposes. Of the balance, only £740,165 was actually disposable, the remainder consisting of public lands that had not yet been sold. The charges upon the revenue on account of debts of all descriptions are estimated for 1888 at £4,306,000, divided as follows: New guaranteed loan, redeemable by a fixed annuity, £307,000; privileged debt, bearing 5 per cent. interest, £1,087,000; 4 per cent. interest on the unified debt, £2,184,000; estimated deficit of interest on the domains and Daira Sanieh loans, £350,000; interest payable to England on Suez Canal shares, £194,000; payment to Daira Sanieh loan commissioners, £34,000; Moukabala annuity, £50,000. In 1888 a new 4½-per-cent. loan was contracted for the conversion of the Daira Sanieh debt, and the further commutation of pensions by the sale of land belonging to the Daira and the domains.

The Government made in 1888 a settlement of the ex-Khedive Ismail's claims, which have been presented annually since the English occupation, but were never before examined or adjudicated upon. He claimed that the International Commission of Inquiry had taken land that he had never conceded, and also the stock and crops on the domains, which had never been accounted for to him, and that the indemnity of £260,000 a year that he had been promised had never been paid. He reckoned his

total claim on the Egyptian Government at about £5,000,000.

The Government made a settlement with him and his sons, by which the portion of the civil list payable to the family, amounting at their estimate to £116,000 was capitalized at fourteen years' purchase, and paid over in the form of 32,000 acres to be selected from the domain lands, valued at £1,680,000. The Egyptian Government claimed that the pensions paid to the princes ceased at their deaths, and in agreeing to convert them into property it conceded Ismail's claim to dispose of his civil list on his death. In lieu of other claims that he had brought he agreed to accept £100,000 in cash, while the Government restored the two palaces in Cairo that formerly belonged to him and the one in Constantinople, which he has made his residence.

Irrigation Works.—The most important work done by English engineers in Egypt is the completion of the barrage, which is a great weir extending across both branches of the Nile. It was begun by French engineers, but abandoned as useless. As soon as it was constructed, Sir Colin Moncrieff determined to utilize it, in the face of the criticisms of English as well as of French engineers. During the first six months of 1887 the Rosetta aqueduct was completed. Next in importance to the barrage is the Canal Tewfiki, which will be opened in 1889. Starting from the apex of the delta, it runs east of the eastern branch to the sea. Irrigating siphons, regulating bridges and locks, distributing sluices, and drainage canals have been constructed within the delta and on both sides of the river. Drainage is at present a greater *desideratum* in Lower Egypt than water-supply. The Mahmoudieh Canal, which supplies Alexandria with water and furnishes water communication between the port and the river, has been dredged. Improved irrigation and the reclamation of submerged lands have caused an extension of cotton cultivation in the Fayoum district. A beginning has been made of cotton-planting in the province of Beni Souef, and in that and the neighboring provinces of Assiout, Minieh, and Girgeh the cleaning of the Ibrahimish Canal and other works have increased the production of sugar by one third.

The expenditure of Sir Colin Moncrieff's department in 1887 was 800,356 Egyptian pounds, of which one half was spent on new works and one half in repairing and maintaining the old. Of the total sum, 213,726 Egyptian pounds came from the ordinary budget, 349,023 pounds from a fund of one million pounds sterling that was raised for public works, and 287,607 pounds from a special fund applicable to the abolition of the *corvée*. The most beneficial reform of the British administration has been the substitution of free for forced labor on the canals. Under the old system men were compelled to leave their homes, often when their labor was most needed for

their crops, and made to work at mending the canals in the most inefficient and wasteful manner. If they brought no tools, they were made to dredge out the mud with their bare hands. Their families brought them food, carrying it sometimes a great distance. In 1883 there were 202,650 men thus employed for one hundred days each. In 1884 the number was reduced to 165,000. In 1885 there were 125,936 men employed at forced labor, while 116,585 Egyptian pounds were paid for substituted hired labor. In 1886 the *corvée* laborers numbered 95,098, and 265,066 Egyptian pounds were expended on paid labor. In 1887 the number of fellahs called out for the *corvée* was reduced to 87,120, and the cost of substituted free labor was 283,561 Egyptian pounds.

The Ministry of Nubar Pasha.—In 1884 Sherif Pasha resigned the post of Prime Minister because he was unable to approve the policy of evacuating the Soudan, on which the British Government insisted. Riaz Pasha, the ex-Premier, a Mohammedan of Turkish origin, who was greatly respected by the Egyptians for patriotism and integrity, declined the office because he held the same views. Nubar Pasha, an Armenian Christian of European education, though equally convinced of the folly of abandoning the Soudan, accepted the post, and was supposed to be a willing instrument of English policy. He was not popular, but was known as a statesman of great experience and ability. He applied himself to the task of smoothing the way for the English projects, and opposed only those that were totally impracticable. When Sir Colin Scott Moncrieff had built the barrage and cleaned out the canals, he proposed that his engineers should direct the irrigation, as well as provide the water, assuming that the provincial officials were all corrupt. Nubar Pasha, however, insisted on preserving the power of the mudirs, who were the visible representatives of authority. With less success, he opposed the sweeping changes that Clifford Lloyd introduced in the Interior Department. Under the old system the mudirs exercised and abused the right to arrest and transport without trial persons suspected of crime. During the former ministry of Riaz Pasha, 1,300 suspicious persons were sent to work in the quarries. Local sheikhs procured the imprisonment of their enemies or of individuals who would pay money to regain their liberty. Yet, when Clifford Lloyd emptied the prisons, setting free thousands of prisoners, some of whom had been detained six years without trial, and placed the prison system and the power of commitment under the direction of English officials, charging police officers with the executive functions of the mudirs, the prestige of the latter was destroyed, and brigandage and crimes of violence became so rife that Nubar's views were finally accepted, and the old system was re-established, with safeguards against abuses. The power to arrest "sus-

pects" was restored to the mudira, but arrested persons could only be committed to prison after a judicial examination before a court consisting of the mudir, a judge, a representative of the Interior Department, and two or three sheikhs of the province. When the English determined on abolishing the *corvée*, the Public Works and Finance departments both suggested the imposition of a water-tax for the purpose; but Nubar Pasha pointed out that the Khedive Ismail had raised the taxes ten per cent. on the ground of increased irrigation, and that the peasantry would not submit to an arbitrary increase, because they look upon the tax as an equivalent for the water furnished. The Egyptian Convention set free an annual sum of £450,000 for the reduction of the land-tax, which the Finance Ministry wished to apply to taxes that could not be collected, while Sir Colin S. Moncrieff needed as much for the abolition of forced labor. At Nubar's suggestion, the amount was divided, £250,000 a year being applied to a gradual abolition of the *corvée*, and £200,000 to offset taxes that could not be collected.

To provide means for their projected reforms, or to escape from the danger of a default of interest, the English were always ready to increase the land-tax or resort to new imposts, notwithstanding the evident signs of overtaxation and impoverishment. Nubar Pasha resisted this destructive policy, and suggested economy of expenditure and the extension of the taxable area by bringing fresh lands under culture as the best means of preserving the financial equilibrium. He instituted a finance committee to examine every proposed change that involved increased expenditure. To promote the second object he gave away large tracts of uncultivated public land, with exemption from taxes for three, six, or ten years. To supply with water 250,000 feddans that were thus taken up, the Nubarieh Canal was built by a private company. Nubar's efforts to keep down expenses and simplify the administration finally brought him into collision with Sir Evelyn Baring in the summer of 1887, and from that time their relations were never cordial. The Prime Minister objected, not so much to the employment of Europeans in the Government departments as to the complication of the administrative machinery by the creation of new departments, bureaux, sections, and subsections. In a report that was signed by Sir Edgar Vincent, Sir Colin Scott Moncrieff, Yakub Artin Pasha, and Blum Pasha on May 24, 1888, the Prime Minister was charged with having obstructed many economies that the financial authorities had proposed. Later, the question of reforming the *octroi* administration came up. Nubar Pasha, following a report of Yakub Artin Pasha, proposed that the *octrois* and the indirect taxes should be placed under the direction of the Ministry of Finance instead of being administered by a separate department. The

change would necessitate the abolition of a post held by a Frenchman, and M. d'Aubigné, the French agent, therefore objected. The Khedive then called upon Nubar Pasha to withdraw his recommendation, and he obeyed, but at the same time called his master's attention to the hostile report, and asked the Khedive either to defend his minister or allow him to reply to his accusers. The Khedive made no reply, and Nubar went on to say that he stood between two fires, and had been made the scapegoat of both the native party and the English, and concluded with the words, "I owe too much to your Highness ever to resign, but it is within your Highness's power to dismiss me when you will." On the following day, June 8, his dismissal was published. This action was taken by the Khedive without consultation with Sir Evelyn Baring, who was absent at Cairo.

The New Ministry.—Tewfik Pasha not only dismissed his Cabinet, but summoned Riaz Pasha to form a new one, without consulting with his English advisers. He had not shown such independence before since the beginning of the English occupation. His choice of a new minister was generally interpreted as a triumph of the anti-English party and of Ghazi Mukhtar Pasha, the Turkish commissioner, whose recall the English had been unable to bring about, and who exercised an unwelcome influence and authority in the country, which grew stronger with every fresh blunder committed by the English administrators. Mukhtar had two months before predicted the very date of the fall of Nubar. He conferred with the Khedive on the evening of the dismissal, received an ovation on the streets when returning from the palace, and Riaz consulted him before accepting office and making up the new Cabinet. The Turkish Government had, since the early period of Mukhtar's residence in Egypt, maintained a diplomatic attitude of observation till January, 1888, when it instructed its commissioner to warn the Egyptian Government against entering into commercial treaties with foreign powers, as instanced by the tobacco convention with Greece to the prejudice of Turkish produce, and to admonish the Khedive against overstepping the firmans in respect to overtaxation of his people. On the removal of Nubar Pasha, Sir Evelyn Baring hastened to Alexandria. He did not attempt to alter the composition of the new Cabinet, except to secure the withdrawal of Omar Lutfi's name as Minister of War and the transfer of Ali Mubarek Pasha, who had been offered the post of Minister of Public Works. The Cabinet was finally constituted as follows: Riaz Pasha, President of the Council, Minister of the Interior, and Minister of Finance; Fakri Pasha, Minister of Justice; Zulfikar Pasha, Minister for Foreign Affairs; Mustapha Fehmi Pasha, Minister of War; Zeki Pasha, Minister of Public Works; Ali Mubarek Pasha, Minister of Public Instruction.

Fighting in the Soudan.—In September, 1886, after the Egyptians had taken Tamai, Osman Digma retired from the neighborhood of Suakin. The Governor-General of the Red Sea Littoral then urged the friendly tribe of Amharas to capture Tokar, and refused to let them trade until they had accomplished that task. They made the attempt, and so harassed the tribes of the neighborhood that the latter called upon Osman Digma to return from Kassala and drive away their persecutors. He came with a considerable army, and after inflicting punishment on the Amharas, laid regular siege to Suakin in the beginning of January, 1888. On the night of the 2d the Arabs began to fire on the redoubts, but were dispersed by shots from the gun-boats in the harbor. The Amharas and other friendly natives, with freed slaves and deserters from Osman Digma's forces, attacked the enemy, with varying success. On January 17 a party of these allies advanced against Osman Digma's camp at Handoub, while Col. Kitchener, the Governor-General of the Red Sea Coast, followed with the regular cavalry. The camp was surprised and captured, but the enemy retook it from the rear, and received Col. Kitchener's force, as it came up to join in the pursuit, with a hot fire, wounding him and another English officer. The garrison of Suakin was compelled to take the offensive, because the "rebels" or "dervishes" had pushed their trenches close under the walls and fired frequently on the forts, and had succeeded in driving off cattle from under the protection of the guns. A large number of slaves that Osman Digma had collected to export to Arabia were released by the expedition to Handoub, and about 180 of his followers were killed. He retired northward with more than 2,000 men, and attacked and defeated the Ambara tribe at Darah. Soon the rebels returned to Handoub, and resumed plundering. On March 4 they took a position in force in an abandoned fort, and opened fire on one of the chief redoubts. A detachment of Egyptian troops was beaten back by a furious counter-charge of Baggara horsemen, who were armed only with spears. Among the killed was Col. Tapp, one of the principal English officers. The enemy, whose losses were severe, abandoned their intrenchments. The dervishes also gave trouble in Upper Egypt by raiding the country between Wady Halfa and Assouan, which necessitated the strengthening of the frontier force. On April 27 Osman Digma was joined by Abu Girgeh, with 3,000 Baggara warriors. The railroad between Suakin and Handoub, had been torn up to build a stockade at Handoub, but the prospect of capturing Suakin was diminishing as the English completed their fortifications. A high stone wall with bastions mounted with heavy cannon was surrounded with a chain of detached forts that were provided with Krupp and Gardner guns and with electric lights, and connected with a railroad for the rapid transference

of troops from point to point. The English opened negotiations with Osman Digma and Abu Girgeh, who expressed a willingness to allow trade, but declared that they would attack every armed force that they found in the country. Egyptian steamers and coast-guard dhows that patrolled the coast were unable to stop the slave and contraband trade with Jeddah, yet the hostile Arabs effectually blockaded the trade that was begun under English protection at Agig. Rumors that arrived from Khartoum indicated that the Mahdi's successor, the Khalifa Abdullah, lived in fear of his enemies, and that dissensions had sprung up among his supporters. In February Osman Janoo, one of his emirs, was defeated by Zaid, a slave of the Sultan of Darfour; but the Mahdist forces put down the rebellion two months later, and sent the Sultan's head to Khartoum. Another uprising between Suakin and Berber was likewise suppressed. Slatin Bey, one of the European prisoners at Khartoum was subjected to ignominious treatment.

The former Governor of Bahr-el-Ghazelle, Lupton Bey, an English officer, who was held as a prisoner by the Khalifa, and whose technical knowledge was made use of in the arsenal, died at Khartoum in July.

In June rumors reached Europe from Khartoum and other parts of the Soudan of the victorious march of a "white pasha," who had entered the province of Bahr-el-Ghazelle at the head of a large military force and established his rule over a wide region. He was at first supposed to be Henry M. Stanley, and afterward seemed more likely to be Emin Bey retreating from the Equatorial Province. The Khalifa sent a large force to Fashoda against the stranger. This and two later expeditions returned unsuccessful. At Gallabat the Soudanese gained a signal victory over the Abyssinians in July. The fighting near Wady Halfa continued during the summer. On August 27 a force of 800 dervishes drove 250 Egyptian soldiers out of Fort Khormoussa, but the position was regained by Col. Wodehouse, who sent a re-enforcement of 150 Soudanese, supported by a gun-boat. On September 17 the besiegers of Suakin took up a position within a thousand yards of the outer forts, where they strongly intrenched themselves. They enlarged and strengthened their position, where about 1,500 men were posted, supported by a large force in the wood near by. On September 25 they made an attack on one of the forts. They accomplished their object in closely investing the town, which was to cut off the water-supply. Some of their shells fell inside the town, but on September 30, after mining to within 500 yards of the Water Fort in preparation for an assault, they were driven from the nearer trenches by a heavy fire from the forts and a war-vessel.

Col. Kitchener, by maintaining the embargo on trade and fomenting war between the friendly tribes and the rebels, was directly responsible for the renewal of disturbances in

the Suakin district. He aggravated the situation by encouraging and subsidizing predatory raids against hostile tribes and sending piratical expeditions down the coast. The naval force was employed in maintaining the trade blockade. Several vessels were captured when landing goods. Permission was given in December, 1887, to the friendly inhabitants of Agig to trade with foreign merchants under stringent restrictions and Government supervision; but the Governor was soon afterward displaced and a personal enemy of Osman Digma appointed, which led to the blockade of the roads by the latter. Col. Kitchener's policy of denying trade, which was generally condemned in England and finally resulted in his transfer to the appointment of Adjutant-General of the Egyptian Army, was adopted for the purpose of coercing the Mahdists to remove their own fanatical inhibition of commerce with infidels. The export of gum arabic from Suakin in 1879 amounted to 207,084 Egyptian pounds, and coffee from Abyssinia and ivory were exported to the amount of 20,000 Egyptian pounds each. The Mahdi prohibited the gathering of the gum of Kordofan, and for five years there has been little trade with the interior. The Mahdist government is based on ascetic religious principles, and, where the authority of the Khalifa is supreme, the possession of riches is discouraged, half of each man's property is counted as belonging to state, and enjoyment of luxuries or display of wealth is treated as a crime. The coast Arabs, on the other hand, are eager traders, and, by holding out the promise of trade as a reward, the Governor-General expected to gain their loyalty and the sooner open up the trade in gum and other valuable products of the Soudan; but, instead of that, he only brought back the miseries of war and stimulated the clandestine exchange of slaves for arms and ammunition. His troublesome restrictions and irritating policy sent many recruits to Osman Digma's banner even from the friendly Amhara tribes. The English officers affect a stringent military *régime* because they hope thereby to succeed to the authority of the Mahdi throughout the Soudan. The power exercised by the Khalifa over the remotest tribes of the desert is attributed to the fear of the black regiments that were enrolled and drilled by Gordon Pasha and of the Bagaras and other fierce tribes from beyond the Nile and also to the exaction of hostages.

The rebel forces that laid close siege to the town in September were those commanded by Abu Girgeh. Shells were cast within the Water Fort every night, and some burst in the town. On October 30 the enemy attempted to storm that fort, but were driven back by a heavy fire from the guns of the forts and ships. Gen. Grenfell, the commander-in-chief, arrived in the beginning of November with re-enforcements. On the 8th he led out the mounted infantry and horse artillery and made an un-

successful attempt to enflade the enemy's trenches. As the result of this reconnaissance he returned to Cairo to dispatch re-enforcements, for he found the enemy strongly intrenched and well supplied with cavalry, infantry, and six rifled guns firing Armstrong shells, which were served with remarkable skill.

The military situation on the Nile was equally critical. The Egyptian garrisons were re-enforced; but the raids of the enemy grew bolder and more frequent, and in the beginning of November their commander at Dongola, Walad-el-Njumi, was engaged in collecting an army for the invasion of Upper Egypt. The Egyptian Government decided to increase the army by 2,000 men, costing £51,000 per annum.

The Equatorial Provinces.—The position of Emin Pasha at Wadelai after the abandonment of the Soudan was entirely analogous to that of Gen. Gordon at Khartoum, and Emin, who had been made Governor of the Equatorial Provinces by Gordon, was as determined as his chief to maintain the government that he had established, although retreat was open to him by way of Zanzibar. He has kept together a well-organized army of blacks and aided in preserving peace and order, for which services the inhabitants paid the taxes that were necessary to support his command long after they had thrown off the absolute authority that he had exercised when the power and prestige of the Khedive's Government stood behind him; and, when support was withheld, he sustained his troops by means of a trade in ivory through Uganda and by planting cotton. In letters that from time to time reached Europe, he expressed the hope that Great Britain would send an expedition to annex the rich country that he had saved from anarchy. When his position began to be precarious, Henry M. Stanley started up the Congo with a relief expedition that was fitted out under the auspices of the British East African Association, a rival to the similarly named German organization. Tippoo Tib, an Arab slave-dealer, who maintains a strong military organization in the region of the Upper Congo, promised to assist the expedition. (See EMIN PASHA.)

On April 4 Emin Pasha received a message from the Khalifa, ordering him to surrender and to disband his troops. A few weeks later his scouts on the Nile beyond Lado reported that an army was approaching. Emin Pasha then determined to advance with the bulk of his troops in order to surprise the enemy, and defeat him by a sudden blow, if possible, for money and provisions were lacking for a regular campaign. The army sent against Emin Pasha was said to be 4,000 strong, and to be ascending the Nile in four steamers and many boats. In the south, Kabrega, King of Unyoro, had been beaten by the ferocious young King of the Waganda, who now held both shores of Albert Nyanza. Emin had lived on nominally good terms with M'tesa, the

late King of Uganda, whereas his son and successor, Myanga, was avowedly hostile. This war between the two powerful neighboring kingdoms in the south interrupted Emin's communications with Zanzibar, and cut off the shortest route by which a relief expedition could reach him from the Congo. When it seemed certain that Stanley's purpose of succoring Emin Pasha had miscarried, Major Barttelot, his lieutenant, who had remained in charge of the supplies in camp at Yambuga, on the Aruwimi, in May, 1888, set out in search of his chief at the head of 100 Soudanese soldiers that were left by Stanley, and 640 Zanzibari and Manyema bearers that Tippoo Tib raised for him. The latter proved unruly, and Barttelot employed harsh means to reduce them to obedience, but before he had gone far the Manyema bearers mutinied against his severe punishments, and assassinated the leader. The second in command, J. S. Jameson, returned to organize another expedition, but was stricken with a fatal fever. After the failure of these expeditions, Dr. Carl Peters and other persons interested in German colonial enterprises in East Africa obtained subscriptions of 1,000,000 marks for an expedition to rescue Emin Pasha, who is a German by birth, and was known as Dr. Schnitzer before he received his title in the Egyptian service, under the conduct of Dr. Peters, Lieut. Wissmann, and Herr Junker. The object of the enterprise was more plainly political than was that of the disastrous English expeditions. The route chosen runs for 1,500 kilometres, or more than three quarters of the distance, through territory over which Germany claims jurisdiction. From Mutansige, where the German possessions end, to Wadelai, the distance in a straight line is only 400 kilometres. The plan was to establish permanent stations along the route. The expedition was delayed by the troubles that occurred in the German possessions (see ZANZIBAR).

EMIN PASHA. The close of the year 1888 leaves the fate of Emin Pasha and of his rescuer, Henry M. Stanley, involved in mystery, while during its course but few, and for the most part unauthentic, tidings have been received from either. That the expedition was successful in arriving at its point of destination is proved by the official report received on December 23, from the Congo Free State, of the return of Stanley to Aruwimi river, in company with Emin, in August of the present year; but when the meeting took place, and whether the presence of one or both on the Congo in that month conflicts with the assertion of Osman Digma at Suakin, December 14, that Emin Pasha with a white traveler, who had been sent to his rescue, surrendered to the troops of the Khalifa on October 11, is matter of conjecture. The strongest proof of the latter story is the accompanying copy of a letter, recognized by Gen. Grenfell as the one written by himself for the Khedive of Egypt, which was forwarded to

Emin by Stanley; but whether the letter was taken from Emin himself or from Stanley, or was captured from some runner, it is impossible to determine.

Stanley (see "Annual Cyclopædia" for 1887, page 250) left Bolombo, May 11, 1887. It is known that he encountered great hardships in arriving at this point, 892 miles from the Atlantic. Scarcity of provisions, difficulties of obtaining transportation, and obstructions on the route, rendered it, in his own words, "a period of great anxiety; and whether we shall be able to tide over, without breach of order, I know not." After he passed Bolombo the conditions improved, the natives were more friendly, and sufficient rations were obtained. On June 18 the mouth of the Aruwimi river was reached, and a camp established, which Stanley left on the 28d with an advance-guard, and instructions that the porters promised by Tippoo Tib should follow with stores. A note was received from him, July 2, which is thus far the last direct communication, and all knowledge of his movements and whereabouts has since been derived from rumor alone. Explorers have been almost unanimous in opinion as to his safety. Stories have been afloat of a mysterious white pasha carrying all before him in the Bahrel Ghazel district, supposed to be Stanley, or, perhaps, Emin; and Arabs arriving at Kinsbassa at one time said that Stanley had been wounded in a fight with natives, and that half of his escort had deserted. The first intelligence of import was received from couriers from Tabora, reaching Zanzibar on Nov. 1, 1888. Their tidings were a year old, but they reported that at the close of November, 1887, detachments of Arabs trading from Tabora in the regions between Lakes Albert Nyanza and Muta Nzige encountered the rear-guard of Stanley's expedition at a point west of the Albert Nyanza, and southeast of Sanga. Stanley himself was not seen, being two days in advance, but tales of hardships endured on the way were told by this party of thirty. There had been fighting with the natives for provisions, one of the white men of the party had died, forty had been drowned in crossing a great river, and Stanley with others had been ill with fever. This had delayed the march, already slow, three weeks. The total force, deducting all losses, was estimated by the Arabs at 250, but they were believed to be able to accomplish the journey. The northeasterly direction of the line of march had been abandoned to avoid the swamps, and Stanley was then proceeding north, intending to strike afterward to the east toward Wadelai, distant, it was estimated, a journey of forty or fifty days.

The reports of combats with the natives are substantiated by accounts from reconnoitring parties from the Aruwimi camp, who passed quantities of bones, supposed to be those of victims fallen in battles between the expedition and native tribes, and also by dispatches from Emin, dated at the beginning of 1888. Emin

was at that time in difficult straits, owing to the non-arrival of the promised stores, and had received reports of Stanley, stripped of men and supplies, hemmed in between the Maboda country and the Albert Nyanza, as also of his change of march in an unknown direction, owing to conflicts with the Matongora and Mino tribes. Advices from Emin, bearing date September and November, 1887, gave no tidings whatever of Stanley, though he himself headed in November a reconnoitring party to find him. In a letter to Dr. Felkin, published in the "Scotchman" of April 11, which bore date Sept. 3, 1887, in allusion to the Congo route, Emin said: "I know the almost impassable swamps, the number of rivers with floating vegetation, from personal observation, and I know well enough the difficulties which a traveler will have to surmount in marching from the Congo here." And yet this route through unexplored territory was deemed safer by the explorer than the more direct one through hostile Uganda.

Whether, as was asserted by Mr. Jameson, second to Maj. Barttelot in command, Tippoo Tib awaited news of the arrival of the advance-guard before sending carriers, or it arose from remissness in fulfilling his contract, a whole year was consumed in collecting the porters, who finally did not reach the appointed number. The severity of Maj. Barttelot had been severely commented on; officers and men were alike dissatisfied. Tippoo, it is said, vainly remonstrated against his treatment of the men. On June 10 he left the camp with a force of 22 Soudanese, 110 Zanzibaris, and 430 Manyemas, under command of a native Arab chief, Muni Somai. His intention, expressed in a letter to Mr. Mackinnon, was to follow Stanley, and, if possible, to find him, and, failing this, to reach Emin Pasha; and, if further search by them both were deemed futile, to place his forces at Emin's disposal. On July 19 he was assassinated by the Manyema force, who deserted, and on return to camp, Maj. Jameson proceeded to Stanley Falls, to organize another expedition. But his death at Bangala, August 17, put an end to all hopes of the kind. Capt. Van Gèle, a Belgian officer of the Congo, denies that Tippoo Tib was accessory to the death of Barttelot, and that chief, who was absent on an exploring party with Lieut. Baert, Belgian resident at Stanley Falls, south of Kasongo, expressed great regret, declaring he would have given half his fortune to avert the catastrophe, and repeated that he had warned Maj. Barttelot. These details are all that so far has been learned of the relief expedition. Maj. Bonny is in command of the Aruwimi camp, and it is said he was lately reached by a rumor that Stanley was proceeding at the back of the great oil rivers, under the British flag, and that the natives were friendly.

As regards Emin and his companion, Casati, who was left in November, 1886, with a detachment of soldiers at Unyoro, letters to Capt.

Camperio from the latter, of date Sept. 1 and 24, 1887, say that he had been taken prisoner by King Traxiore, whom he finally persuaded to become friendly to Emin, and who eventually charged him with a mission to negotiate an alliance. Emin's position in the beginning of April was reported hazardous. Two native messengers, who had been delayed by capture by Ugarda tribes, said, on August 1, at Zanzibar, that a summons to surrender had been received from the Mahdi at Khartoum, threatening attack, as also a letter from Sufton Bey (which Emin considered a forgery), urging assent to the surrender, in order to avert a massacre of Europeans at Khartoum and Wadelai. Outposts confirmed reports of the Mahdi's advance, alleging appearance of armed vessels at the confluence of the Nile and Sobat, and Emin had decided to advance with the bulk of his troops by the left bank of the Nile, and endeavor to surprise the Mahdi, compensating for lack of provisions by the rapidity of his attack. He was sorely troubled by the non-arrival of Stanley. Provisions were scarce, and the troops beginning to become discouraged. There have been reports of the arrival of Stanley at Wadelai early in January and of the concerted action of him and Emin, but these are denied.

In reply to a request of Gen. Grenfell for news of Stanley, Osman Digma furnished at Suakin the news received in a letter from the Khalifa Abdulla, of the surrender of Emin and a white traveler in chains by the officers and troops of the former to Oman Saleh, commanding a steamer expedition to the equator, which reached Lado on October 11. Oman Saleh found a quantity of feathers and ivory. He reported that a white traveler sent to Emin, named Stanley, brought orders from the Khedive to accompany him, offering the remainder of the force the option of going to Cairo or remaining. They refused to enter Turkish service, and welcomed Oman. Another traveler had visited Emin and was gone, but he was making search for him. In proof of the capture, Osman Digma sent Snider cartridges, alleged to have been taken from Emin, and Dr. Junker says that Emin was provided with Snider arms. But the date on these was twenty years old, and the weight of evidence lies with the letter of the Khedive, the existence of which, being a state secret, is with difficulty explained, and renders it impossible to regard the whole as a stratagem to secure the surrender of Suakin in exchange for the lives of the white prisoners. If Stanley returned alone to Bongala, as is said in advices of December 21, leaving Emin in possession of plentiful stores of ivory, with numerous oxen, and in health but for a slight affection of the eyes, he may have escaped the fate of Emin, should the latter prove indeed a captive.

A second expedition for the relief of Emin has been for some time under discussion at Berlin, to be commanded by Lieut. Wissman, and it is expected to set out in February, 1889.

The delay is partly due to the impossibility of obtaining the passage of the East African bill by the Reichstag before that date. The expedition is advocated by the German Government as assisting the anti-slavery operations in Africa.

A letter written by Mr. Stanley reached Brussels on January 16. It was dated at Boma of Bonalya Muritia, August 17, and was addressed to Tippoo Tib. He says: "I reached here this morning with 180 Wangwana, 8 soldiers, and 66 natives belonging to Emin Pasha. It is now eighty-two days since I left Emin Pasha on the Nyanza. I only lost three men all the way. Two were drowned, and the other decamped. I found the white men who were looking for Emin Pasha quite well. The other white man, Casati, is also well. Emin Pasha has ivory in abundance, thousands of cattle and sheep, goats and fowls, and food of all kinds. I found him a very good and kind man. He gave all our white and black men numbers of things. His liberality could not be excelled. His soldiers blessed our black men for their kindness in coming so far to show them the way. Many of them were ready to follow me out of the country, but I asked them to stay quiet a few months, that I might return and fetch the other men and goods left at Yambunga. If you go with me it is well; I leave it to you. I will stay here ten days, and will then proceed slowly. I will move hence to Big Island, two hours' march from here above this place. There there are plenty of houses, and plenty of food for the men. Whatever you have to say to me, my ears will be open with a good heart as it has always been toward you. Therefore if you come, come quickly, for on the eleventh morning from this I shall move on. All my white men are well, but I left them all behind except my servant William, who is with me."

ENGINEERING. Bridge over Harlem River.—The insignificant estuary that separates Manhattan Island from the mainland promises to become in itself a compendium of bridge architecture. It is already crossed by numerous structures representing nearly all the types of bridge-building, from solid masonry to finest steel. The latest addition, as shown in Fig. 1, is a good specimen of modern engineering. It crosses the river at 161st Street.

The banks at this point are quite high and precipitous, those on the island or west shore rising directly from the water, while those on

FIG. 1.—NEW BRIDGE OVER HARLEM RIVER.

the mainland are now separated from the water by flats on which are wharves, railway tracks, etc. The new bridge is for a highway.

The structure is combined masonry, steel, and wrought-iron, carrying foot and road-ways. The approaches are each 660 feet long, and the remaining 1,060 feet—the bridge proper—consists of two steel arches and a central stone pier. The carriage-way is 50 feet wide, with a 15-foot side-walk on either hand. The carriage-way is laid with granite blocks, and is 151 feet above the river. The intrados of the arch is 133 feet above the river.

One of the most interesting engineering features of the structure is the bearing of the arch ribs, as illustrated in Fig. 2. At the end of each rib the top and bottom chords converge, and a second bearing or bed is formed, which receives the projecting surface of the pin, a free space being left between the skewback bearing and terminal of the rib. Thus a sort of hinge-joint is formed that secures a true thrust undisturbed by varying load or by changes of temperature. As the rib can oscillate freely in such a

has two distinct functions, namely, wind bracing, in the line of upper and lower flanges or chords of the ribs; and sway bracing, which extends from rib to rib at each junction of the voussoirs or panels. From the upper surfaces of the arch rise vertical columns, upon which rest the cross floor-beams. These columns are 15 feet from center to center, and they determine the varying length of the rib panels, already alluded to, as each column starts from the termination of a joint between the voussoirs. The two main arches, one spanning the river, the other the railroads, streets, and low ground on the east bank, are identical in construction. They contain about 7,500 tons of iron and steel.

The skewbacks, pins, and bearings are of forged steel. The arch-ribs are of steel. Both open-hearth and Bessemer steel are used, but the tests call for an ultimate tensile strength of 62,000 to 70,000 pounds to the square inch, an elastic limit of not less than 32,000 pounds, with a minimum elongation of 18 per cent. The bracing, vertical posts, and floor-beams are of wrought-iron. Most of the riveting is done by machine, air riveters being used for work *in situ*. Before being riveted together, all abutting surfaces were painted. Rivets of seven-eighths-inch diameter are used throughout. William R. Hutton is the chief-engineer, with Theodore Cooper as assistant.

Pontoon Bridge at Nebraska City.—Pontoon bridges are generally used for temporary purposes, but there are some notable exceptions. At Nebraska City the Missouri river has two arms, and the main branch has a very swift current, often bearing large quantities of drift-wood. The lesser arm is crossed by a permanent crib-work, 1,050 feet long. The pontoon section is 1,074 feet long. A central span of 528 feet is closed by two swinging sections, which form a V-shaped junction, with the angle pointing down stream. When it is desired to open the draw, the fasts at the apex are cast off, and the two halves at once swing apart, the current doing all the work. The operation of closing is also aided by the current, and the whole, it is said, can be effected by one man. The floats are constructed so that the ordinary "flood trash" of the river is carried under them by the force of the current. The constructing engineer was Colonel S. N. Stewart, of Philadelphia, and the success of the bridge has been such that others are already proposed for the great Western rivers. The cost of the structure was \$18,000, and it was built in a surprisingly short time.

Just above the pontoon is a second bridge, built for the use of the railroads. This also is a recently completed structure. It was built by the Union Bridge Works, and is of steel throughout. The caissons were sunk in December, 1887, and January and February, 1888. The first piece of metal was put in position February 13, and on June 8 the last piece was in place. The through spans are 400 feet, the

FIG. 2.—PIVOT-BEARING AND SKEWBACK, HARLEN BRIDGE.

bearing, no destructive strain is possible. Each rib thus ends, constructionally speaking, in a sort of point. As a concession to the public the general lines of the rib are carried out as shown in outline, but these outlined parts do none of the work. It is rather a pity that these superfluous plates were added. They detract from the character of the structure, and the public should be educated up to such devices. With an extreme range of temperature, a rise and fall of the crown of the arch through a space of three inches may occur, and many times this amount is provided for by the pivotal bearing.

Each arch consists of six ribs thus constructed and supported. They are spaced laterally 14 feet from center to center. Their rise is 90 feet. They are connected by bracing that

deck span 325 feet long. The entire length of the bridge is 1,128 feet, and its weight is 1,489 tons. The stone piers are 85 feet high, and are 18 by 46 feet at the base.

The Arthur Kill Bridge.—The history of this bridge involves some interesting problems in law as well as in mechanics. Arthur, or more properly Anthur (that is "farther") Kill is a tidal river separating Staten Island, N. Y., from New Jersey. It is, therefore, an interstate bridge, and the sanction of the General Government had to be secured for its erection. The Secretary of War held the plans under consideration for nine months, and finally approved them without modification. Then followed an injunction procured by the State of New Jersey, which checked the work for six months longer, and was finally disposed of by Justice Bradley, of the United States Circuit Court, who decided against the injunction, holding that Congress had the right to regulate interstate commerce even though the States themselves were opposed to its action.

The great importance of securing railroad communication with the mainland is obvious at a glance, since the shores of Staten Island are admirably adapted for purposes of commerce. Five or ten miles of additional wharfage will be opened on New York harbor, and the facilities of shipment will thus be very largely increased. The bridge was authorized by act of Congress of 16 June, 1886, and two years were allowed for its completion. On 13 June, 1888, the great draw was pronounced in working order. The bridge is owned by an independent organization, the Staten Island Rapid Transit Company, and is open to the use of all railroads on payment of the regular tolls. This removes it from the suspicion of monopoly, since it is practically a public highway. The Kills at this point are about 600 feet wide for navigable purposes, and the entire length of the bridge, exclusive of approaches, is 800 feet. It consists of two shore-spans of 150 feet each, covered by fixed trusses, and two draw-spans of 206 and 204 feet each in the clear. The draw-bridge is the largest now in existence, the total length being 500 feet, but it can be opened or closed in about two minutes. The lower chords of the draw-trusses are 30 feet above mean high water. The iron work was pushed with great rapidity, and under apprehensions at times of delay on account of strikes. In four weeks the draw-span was put together. Two weeks more were required for the adjustment of the machinery. The draw contains 656 tons, and each of the approaches contains 85 tons of metal. The total cost of the bridge was \$450,000. The iron work was supplied by the Kingston Bridge Company, and Charles Ackenheil was the superintending engineer. In modern engineering works, especially where they are pushed forward with rapidity, there is often a culpable carelessness. The Arthur Kill bridge was completed without any fatal accident.

Bridge at Benares, India.—An important link in the Indian system of railroads was finished and opened for traffic early in February. The structure is named for Lord Dufferin, Viceroy of India, who took part in the opening ceremonies. The bridge was constructed for the Oudh and Rohilcund Railway Company, under the superintendence of H. B. Hedersedt, chief engineer, and F. T. G. Walton, executive engineer. The river Ganges at this point is more than 3,000 feet wide, and the total length of the bridge is 3,568 feet. The work has been more than eight years under construction. The shifting sand-bed and the rapid current, with great fluctuations in the depth of water, have presented obstacles to rapid work. The main stream is crossed by seven spans of iron girders of 856 feet, each supported on brick piers. But less than half the brickwork of these great piers is visible, no less than 120 feet of the masonry being below water, and 82 feet representing foundations carried into the sandy bed of the river, which here, in the rainy season, has a depth of 92 feet, with a velocity of 20 feet a second. The total cost of the bridge, not including the approaches, was about \$3,000,000. Since 1881 Mr. Walton has had the personal superintendence of the work, and his services were recognized by the Empress, who created him a Commander of the Indian Empire. The city of Benares is one of the most important, historically and commercially, in India, and is regarded as sacred by the Hindus. The opening of direct railroad communication with the sea-coast will vastly increase its commercial facilities, and will no doubt radically change its character before many years.

Foot-Bridge, River Ouse.—The city of Bedford, England, lies on the north side of the river Ouse, about forty-five miles from its mouth. The corporation of the city acquired land on the south side of the stream for a public recreation-ground, and it became necessary to span the river with a foot-bridge of such construction that it would not obstruct the view, for public gardens already existed on the north side of the stream. It was deemed necessary also to insist upon a clear waterway of fifteen feet in mid-channel. There was practically no place for abutments. The conditions were met by means of the double arch shown in the illustration, the upper one consisting of two arched ribs by which the lower arch bearing the footway is supported. The clear span is 100 feet, and the footway is 7 feet wide. The arched ribs each consist of four angles 4 inches by 8 inches by $\frac{1}{4}$ inch, braced together by angle irons 3 inches by 3 inches by $\frac{1}{4}$ inch and $2\frac{1}{2}$ inches by $2\frac{1}{2}$ inches by $\frac{1}{4}$ inch, and flat bars 3 inches by $\frac{1}{4}$ inch, and $2\frac{1}{2}$ inches by $\frac{1}{4}$ inch; the ribs are 1 foot 6 inches deep by 1 foot wide at the center, increasing in width to the abutments, where they are also splayed out horizontally to withstand the wind pressure. The suspension rods are $\frac{1}{2}$ inch diameter attached to the vertical members of

the rib by 1-inch pins at intervals of 5 feet, and to the angle-iron stringer beams, which carry the roadway. The roadway consists of corrugated flooring plates $\frac{1}{2}$ inch thick, 8 inches deep, and 1 foot pitch. The plates are covered with concrete of cement and granite chippings, and

Hydraulic Canal Lift at Les Fontinettes, France.—On the 8th of July took place the official ceremonies attending the opening of this magnificent work near St. Omer on the Neuf-Fossé Canal, which connects the ports of Calais, Gravelines, and Dunkerque with the canal system to

FIG. 3.—FOOT-BRIDGE OVER THE RIVER OUSE.

as the first part of the roadway is necessarily rather steep, it is stepped out into 2-feet-6-inches treads, with a 3-inch rise. The stringer beams, to which the flooring plates are riveted, are of angle irons 6 inches by 3 inches by $\frac{1}{2}$ inch, bent to a radius of 114 feet, having a versed sine of 11 feet 6 inches; and an ornamental rolled iron is riveted to each with countersunk rivets. Two ornamental cast-iron pillars are fixed at each approach, and termi-

the southward. It was begun by Louis XIV, and all the barge traffic from the ports in the vicinity of Calais, are obliged to pass through this section on their way to Paris or Lisle. The annual traffic amounts to 800,000 tons, and will become greater with increased facilities. Hitherto the change of level at Les Fontinettes has been overcome by means of locks, and boats were often detained for several days awaiting their turn. While contemplating the construc-

FIG. 4.—HYDRAULIC CANAL LIFT AT LES FONTINETTES, FRANCE.

nate the hand railing. The total weight of the iron work in this remarkable structure, including the flooring plates, bolts, ornamental pillars, etc., is less than 28½ tons. The bridge was designed by John J. Webster, and was erected under his superintendence.

tion of a second series of locks, the attention of the administration was directed to a hydraulic canal lift that had been constructed on the Trent and Mersey Canal in England. The result was that a contract was made with Messrs. Clark and Oail, an English firm, for

the construction of a lift at Les Fontinettes. A prospective view of the completed work is given in the illustration. It consists of two immense troughs of plate-iron—sections of the canal, they may be termed—capable of receiving and floating boats of 800 tons. Each of these troughs rests upon the head of a piston, which works in the cylinder of a hydraulic press. These presses are in deep wells sunk between the towers in the foreground. The presses are connected by a pipe with a sliding valve, and when this is open a hydrostatic balance is established. If one of the troughs is more heavily loaded than the other, it descends and forces the other to ascend, and the preponderance of lifting force may be turned one way or the other by the usual hydrostatic appliances. The stroke of the pistons is equal to the difference between the water-levels, about forty-three feet. The weight of a trough or "lock-chamber," as they are technically called, is 800 tons when full of water.

Supposing the two lock-chambers to be in position, one at the upper and the other at the lower level: if the communicating valve is opened the upper chamber will descend, and the lower one will rise, and after a few oscillations they will stop midway *in equilibrio*. To prevent this, the upper chamber is supercharged with a weight of water equal to that contained in a press, so that it continues its motion until it reaches the lower level of the canal. Thus each chamber in alternation lifts the other with the least possible waste of water. The chambers are metallic frames constructed according to the accepted rules of resistances. The presses are the largest in existence, 55 feet high and $6\frac{1}{2}$ feet in diameter, and calculated to resist an internal pressure of 27 atmospheres. There were no precedents, as smaller cast-iron presses had collapsed under less strain. It was therefore decided to use rolled-steel rings superposed and set in a groove to prevent lateral movement. To secure absolute tightness the compound cylinder thus formed was lined with copper in a single sheet $\frac{1}{4}$ of an inch thick. An experimental section constructed on this principle sustained a pressure of 175 atmospheres without distortion.

The passage of a boat, which formerly required two hours, is now effected in three minutes. The apparatus is the largest of the kind in existence, and reflects much credit upon Mr. A. Barbet, the engineer of the contracting establishment. A similar lift has more recently been completed in Belgium.

Docks at Havre.—The Bellot Basin, the latest artificial improvement to the important French port of Havre, is constructed upon made land southward of the Tancarville Canal. It is bounded on the south by a masonry dike 3,280 feet in length and a stockade 1,790 feet in extent. Its total length, including that of the entrance-lock, is 3,762 feet. Its two divisions are known as the east and west docks, which are of unequal length, but of a uniform

width of 720 feet. The total area of the dock is 258,460 square yards. The entrance-lock is 98 feet wide and is provided with tide-gates, the leaves of which are of rolled iron, 54 feet wide and 36 feet high, arranged with air and water chambers, so that the weight upon the hinges can be varied between the extremes of 25 tons and 155 tons. The sluiceways, also 98 feet wide, are spanned by revolving bridges operated by powerful hydraulic machinery, as are also the gates, sluiceways, and capstans of the whole basin.

The construction of the beton work was very difficult, owing to the exposed nature of the shore, liable to be swept by severe storms. The excavations had to be kept dry by pumping at every rise of the tide, and in some cases the pumps had to be hoisted as the tide rose. The blocks used for the foundations were 22 feet wide by 33 feet long, each with a central aperture, to allow excavation from within the block. Thirty days were allowed for the setting of the beton. When the masonry was complete the central space was filled in with beton. A barge carrying a boiler, which furnished steam for the pumping machinery, was moored between two of the blocks, so that the pumping was effected with great rapidity. By this process 87 blocks were sunk, representing 1,575,000 cubic feet.

Double-ender Screw Ferry-Boat.—The use of the double-ender paddle-wheel ferry-boat has been carried to greater perfection in America than elsewhere. Indeed, it is only recently that they have been at all used abroad. A new type of boat has recently been launched at Newburg, N. Y., for use on the New York and Hoboken Ferry. She is a double-ender, with a screw at each end. The shaft runs the entire length of the boat, and the screws always rotate together, being incapable of independent movement.

Many advantages are claimed for this system. All the machinery is below decks, enlarging the deck-room about 20 per cent. The absence of paddle-wheels, of course, largely increases the cabin-room. The engines are of the ordinary triple-expansion type, but the crank-pins are of uniform diameter, because the engine will be worked in one direction quite as much as in the other. For the same reason the screw-propeller blades have both faces alike, since they will be required to work both ways. One of the obstacles to ferry-boat navigation is the liability of the slips to become filled with ice. Ordinary tug-boats have been found very effectual in clearing the slips by simply revolving their screws. Paddle-wheels have merely a surface effect. It is thought, therefore, that the new type of boat will be able to clear ferry-slips of ice with great ease. It has been suggested by Capt. Zalinsky, inventor of the dynamite gun, that the ordinary type of ferry-boat could be easily made available for harbor defense by mounting pneumatic guns upon them. It is evident that a vessel of the type of

the "Bergen," as the new boat is named, would have many advantages over side-wheelers for war service, since her screws and the most vulnerable parts of her machinery are under water. The "Bergen's" builders are Thomas C. Marvel & Sons, of Newburg, N. Y.

Ferry at Greenwich, England.—More than two centuries and a half have passed since a ferry was first established at Greenwich, on the Thames, below London, but no attempt has been made until the present year to introduce modern methods. The peculiar difficulties of the situation include a sloping river-bottom and a tidal rise and fall of 20 feet. At high water, therefore, the boat can land at the bulk-head line, but at low tide she can not approach it within three or four times her length. To overcome this, an inclined railway, 348 feet long, has been laid on the bottom, the whole securely bedded in concrete. Up and down this incline a landing-stage is moved by means of suitable machinery, and two platforms are made to travel back and forth between the landward side of the stage and the wharf, whatever the distance may be. "On each side of the river," says London "Engineering," in a detailed description of this ferry, "close behind the abutment, two cast-iron cylinders are sunk close to each other to a depth of 145 feet below the level of the roadway. The cylinders are 10 feet diameter on top, increasing in size by varying cones to 11 feet 6 inches in diameter at the bottom. The metal varies in thickness from $\frac{7}{8}$ inch to $1\frac{1}{4}$ inch. The contractor for this work, with fine old English crusted conservatism, is doing the sinking of the cylinders with divers, so that it is at once evident that speed of sinking and cost are matters of comparatively small importance.

"The cylinders are for the purpose of wells, in which weights will be worked to act as counterpoises to the traveling-carriages and landing-stage. Sufficient engine-power has been provided to overcome the inertia in moving these platforms, and also any additional weight of traffic which they may carry. As the slope on which they travel is 1 in 10, one tenth of the weight in the wells will balance that of the platforms and landing-stage."

It seems well nigh incredible that such primitive methods of propulsion should be used in the greatest capital of the world, and there is no obvious reason why the double-ended American ferry-boat system should not have been used to advantage in dredged ferry-slips, instead of the comparatively complicated stages and platforms here described.

Moving the Brighton-Beach Hotel.—During the winter of 1887-'88 the ocean made such encroachments along the beach of Coney Island that the foundations of the Brighton-Beach Hotel were undermined and the entire basement story was washed away. The most approved devices were tried in vain to prevent the inroads of the sea, and the hotel proprietors finally decided to move the building back

six hundred feet to a place of safety, a work of no small magnitude, since the building, a wooden structure, was 465 feet long, 150 feet deep, and three stories high. The estimated weight was 5,000 tons. The contract was awarded to B. C. Miller & Son, of Brooklyn, who agreed to do the work for \$12,000.

The first operation was to lay twenty-four parallel tracks underneath the building and extending landward about three hundred feet. A mile and a half of rails and 10,000 ties were used, the ties resting upon planks. The building was then jacked up, and 112 ordinary platform cars, hired for the purpose, were rolled under the building, having transverse timbers laid across them for the sills to rest upon. A twenty-foot section of the hotel was raised enough to admit the passage of the cars with an inch or two to spare, and when the car was in place the section was lowered, care being taken to adjust the bearing so as to secure as even a distribution of weight as possible. The cars were jacked apart before the weight was allowed to settle upon them. Heavy tackle-blocks and falls were next attached to the twenty-four lines of cars upon which the bridge finally rested, and the running parts were attached, as shown in the illustration, to locomotives, some of the falls crossing one another, so that each gang of locomotives had its pulling-strain distributed over more than half of the building.

On April 3 the ropes were tightened for the first time, and the building was moved a short distance without difficulty. The next day, with four locomotives, it was moved to the end of the rails. The track already passed over was then taken up and moved in front of the locomotives and the rest of the journey completed without the least difficulty. Probably it is the most considerable feat of house-moving ever undertaken.

Harbor Improvement.—Commercially speaking, one of the most important works recently undertaken by the United States Government is the deepening of the channel in New York harbor. In view of the greater length and deeper draft of ocean steamers, it has become necessary to deepen the channels, and at the same time to straighten them, because quick turns are impossible for very long ships. Large steamers are obliged to fix their hours of sailing so as to reach the bar at high tide, and inward bound vessels are frequently obliged to anchor outside and wait for high water. In 1884 an appropriation of \$200,000 was made by Congress for the improvement of Gedney's channel, and Col. G. L. Gillespie, of the United States Corps of Engineers, was directed to make a survey with a view to determining the best course of procedure. The result of careful soundings showed that no shoaling whatever had taken place since the first accurate coast survey of 1835, a channel twenty-three feet deep having been maintained by the natural scour of the tides. It was held, therefore, that

FIG. A.—MOVING BEAMTYPE BLACK BOARD.

the natural forces were adequate only to maintaining this depth, and that a greater depth could be secured only by contracting the tidal prism. To effect this, it was recommended that a dike be built from near Coney Island in a southwesterly direction toward Sandy Hook. Such a dike would close two of the least used channels, but would increase the natural scour of the Main and Swash channels and would presumably deepen them to thirty feet at mean low water.

The appropriation, however, was specifically for the deepening of Gedney's channel,

wheels near the deck. The scoop is lowered to the bottom, where it runs on wheels. The steel connecting pipe contains a ball-and-socket joint, and includes also a short length of heavy India-rubber pipe re-enforced with steel bands, in order to prevent breakage when the vessel is rolling or pitching in a seaway. By means of a steam jet connected with the top of the centrifugal pump, a vacuum is produced within the pump and pipe, under the effects of which vacuum water rises through the pipes until the pump-chamber is completely filled. Then, on starting the pump and opening the outlet

FIG. 6.—BOAT AT WORK DEEPENING CHANNEL IN NEW YORK HARBOR, WITH DRAWINGS OF DREDGES.

and hydraulic excavators were employed, which worked by means of centrifugal pumps and deepened the channel two feet over a width of 1,000 feet. In 1886 a further appropriation of \$750,000 was granted for the general improvement of the harbor, and as this was insufficient for the proposed dike it was decided to continue dredging operations.

The contract was awarded to the Joseph Edwards Dredging Company. The vessels employed under this system are propellers, fitted with centrifugal pumps and dredging scoops. Each vessel is divided by bulkheads into tanks for the reception of the dredged material. In the bottom of the tanks are valves operated by

valve hitherto closed, it at once begins to draw up material. At the upper surface of the scoop, a foot above the bottom of the channel, a water-valve is arranged, which may be opened or closed by means of a small rope or lanyard. This is done from the deck of the propeller, and regulates the proportions of water and solid material. The operative can tell by the sound of the pump whether it is receiving too much or too little solid material, and sets the valve accordingly. When at work, the boat steams ahead at a rate not to exceed two miles an hour, dragging the scoops slowly over the bottom. The pumps are driven as fast as possible, as it is found that their efficiency is cu-

mulative in proportion to the speed, that is, ten strokes in a given time will do more than twice as much work as five strokes in the same time. The boats are very wide, so that the rolling is slight, and the suction pipes are attached amidships, so that they are but little affected by the pitching.

At the close of the season a nearly uniform depth of 28 feet had been secured in a channel about 600 feet wide. Three dredgers similar to the one described were kept constantly at work, their total daily capacity being 6,500 cubic yards of solid matter. All the material is taken out to sea and dumped in not less than 14 fathoms of water.

Thus far observations have shown that instead of shoaling during the winter, the dredged out channels are slightly deepened by the storms of winter, and there is some reason for hoping that the dike may not, after all, prove to be necessary.

Lumber-Raft.—The launching of a great lumber-raft, and its dispersion while *en route* to New York, in 1887, were recorded in the "Annual Cyclopædia" for that year (page 257). The projectors of the enterprise were not discouraged by failure, but began preparations for a repetition of the experiment on a still larger scale. The port of Joggins, on the Bay of Fundy, was as before selected for the building and launching, and the experience gained in former attempts was utilized to the best advantage. The construction was begun in March, and finished about the 1st of July in anticipation of the high spring tides of that month. The logs were laid together in a great cradle constructed for the purpose. A massive chain-cable ran longitudinally through the center. Its links were 11 inches long and 7 inches wide and 1½ inch thick. At distances of 10 feet radial chains diverged from this central cable and were clamped to cross-pieces on the outside of the raft. At intervals between the cross-chains, the raft was bound by girths of wire rope. It is evident that when towed by means of a line attached to the central cable the tendency of the stress must be to bind the whole together in a solid mass.

The raft was cylindrical, with the ends tapered. It was 595 feet long and 150 feet in girth at the midship section. It contained 22,000 logs averaging 40 feet in length, and the total weight was estimated at 10,000 to 15,000 tons. The expected high tide came on July 25, submerging the seaward end of the raft as it lay upon the ways.

The raft slid into the water as soon as the blocks were knocked away. When the enormous weight and dimensions of the mass are taken into the account, it is highly creditable to the designer, Hugh R. Robertson, an old lumberman, that the launch was effected with such perfect success. The "Great Eastern," it will be remembered, was only launched after three months of hard work and after the resources of English engineers had been well

FIG. 7.—THE GREAT LUMBER-RAFT.

nigh exhausted. She exceeded the raft in length by less than 100 feet.

Two powerful sea-going tugs, the "Underwriter" and the "Ocean King," undertook the work of towing the raft to New York, which was effected, without accident or material delay, in 11 days, a distance of 700 miles. Heavy

Erie Basin where, after being visited by thousands, it was broken up and the logs disposed of at an alleged profit of \$10,000 to \$12,000. It is understood that the success of the scheme has been the death-blow to further enterprises of the same kind, for the general lumber-shipping interests would be so seriously injured,

and the danger to navigation is so great in case the raft breaks up at sea, that the Dominion authorities will not permit similar undertakings in the future.

Hoisting-Shears.—With the increased size and weight of machinery and naval equipment, it has become necessary largely to improve the appliances for handling them. On one of the moles of the National Dock at Marseilles, France, a powerful set of shears was erected early in the year, under contract for the Marseilles Chamber of Commerce, by the Compagnie de Fives-Lille. The conditions called for variable powers of 25, 75, and 120 tons, to be obtained at will, with a proportional output of water for hydraulic pressure, and the load had to be lifted 22 feet above the quay and carried horizontally from 28 feet beyond the edge to 16 feet in the rear, so that the load might be taken from a ship and deposited upon a truck, and vice versa. It is believed that direct hydraulic action for very heavy weights is now achieved for the first time. In the large apparatus constructed by Sir William Armstrong, the lifting power only was employed, the shifting process be-

FIG. 8. -120-TON SHEARS, AT THE PORT OF MARSEILLES.

seas were encountered off Cape Cod, and the plank sheathing on the bow was carried away. The raft was anchored for a few hours in Vineyard Haven, while the tugs procured supplies. The inside course was followed through Long Island Sound. Five tugs were necessary to bring the raft through the tortuous channels of Hell Gate and the East river and into the

ing effected through independent mechanism.

Technically, the apparatus is of the type known as the oscillating tripod. It consists of two lateral iron-plate uprights, (Fig. 8), resting upon the wharf wall, and of a beam, jointed to them above and connected below with the head of the piston of a hydraulic press. This latter rests upon an iron-plate

frame, bolted to masonry. The piston pulls the beam toward it when it descends, and carries along in the same motion the shears, as well as the load suspended from their point of junction, and the load is thus carried to a distance of 16 feet from the edge of the wharf in order to be placed upon a car. Conversely, if the piston rises, it pushes before it the entire framework, as well as the lifting apparatus, so that the latter can be lowered on a line 28 feet beyond the face of the wharf.

The lifting apparatus consists likewise of a hydraulic press suspended from the summit of the tripod; but, in order to prevent the joints of the cylinder from working under the action of the load, which would tend to open them and cause leakages, it is not suspended from the exact axis of the junction of the shears. The cylinder rests directly upon a huge stirrup 45 feet in length, the arms alone of which are affixed to the axis, through a Cardan joint. Under such circumstances, the stress of the load carried by the piston-rod is exerted solely upon the branches of the stirrup, and the sides of the cylinder work only under the pressure of the motive water. The latter is introduced

FIG. 9.—AUTOMATIC MULTIPLIER (WITH SHEARS).

at the base of the press, through a valve operated at will by a man who stands upon a platform arranged for the purpose.

In order to produce the three powers of 25, 75, and 120 tons called for by the specifications, and at the same time expend in each case a corresponding quantity of water under pressure, it is of course necessary to cause the pressure of the motive water to vary in proportion. This result is reached by calculating the diameter of the two cylinders so as to obtain the mean power of 75 tons, in making the water of the general conduit act directly under

the normal pressure of 50 atmospheres. For the powers of 25 and 120 tons, use is made of an automatic multiplier, which consists of two cylinders arranged end to end, in which move pistons A and B (Fig. 9) of different diameters. When it is a question of lifting 120 tons, the water at 50 atmospheres actuates the piston A, and B forces water into the lifting cylinder under a largely increased pressure. If the load to be lifted is but 25 tons, the water at 50 atmospheres actuates the piston B, and A forces the water into the same cylinder at a much lower pressure. The same operations are effected in the other cylinder when the extreme loads of 25 and 120 tons are moved. The shears are likewise provided with a hydraulic cylinder (Fig. 8), placed on the back of the beam, and serving through a cable, to bring the piston of the large cylinder to the end of its upward stroke, and for certain accessory work. Finally, the apparatus as a whole is completed by an accumulator containing in reserve a large part of the water necessary for each operation.

Steamships.—A noteworthy step in the development of steam navigation is found in the sister-ships, the "City of New York" and the "City of Paris." The first of these was in active service during the summer, and the last was nearly ready for her trial trip at the end of the year. Not only are these vessels larger than any other of the Atlantic liners, but the twin-screw principle receives in them its first trial on a large scale for the merchant service.

The builders are Messrs. James and George Thompson, of Clydebank, near Glasgow, who have turned out many of the finest vessels afloat. The particulars of the design were left to them, the only conditions specified by the Inman Company being that the vessels were to be unsinkable, as comfortable as any hotel, and as swift as possible consistently with the conditions first named. The following table shows at once the dimensions of these latest additions to the fleet, and the development of first-class passenger steamers since the earliest days of regular transatlantic steam navigation:

TABLE GIVING CHIEF DIMENSIONS OF NOTABLE ATLANTIC LINERS.

NOTE.—Those marked * were built of wood, † of iron, and ‡ of steel.

Throughout, the vessels were constructed under the surveillance of Lloyd's agents, and according to the best-approved plans of modern marine architecture. When nearly ready for launching, 7,000 tons of material had gone to the construction of each ship; the heaviest steel castings for the hulls being the stern-posts (28 tons each), and the heaviest for the engines (50 tons). The steel was all subjected to an anti-corrosive process.

The hull of each vessel is divided by permanent transverse bulkheads into fifteen watertight compartments, including three for boilers and two for machinery, the latter being separated by a longitudinal bulkhead. The doors in the bulkheads are on the upper deck far above the load-water-line, it being determined not to trust to the doors being promptly shut in case of danger. None of the compartments exceeds 35 feet long, and the quantity of water they hold to load-water-line is 1,250 tons, or to upper deck, 2,250 tons. Even were two or three filled, the flotation of the vessel would not be placed in danger, and her buoyancy could easily be trimmed. As an additional precaution, the vessel has two bottoms, the space between them being four feet. They serve a double purpose, for not only will the existence of an inner bottom make it certain that no part of the ship will be flooded by a fracture of the external bottom, but the space can be utilized for carrying water-ballast, to the extent of 1,800 tons, for adding to the stability or altering the trim of the ship. The stability of the vessels is further secured by "rolling chambers," similar to those that have been successfully tried on several modern war-vessels. The chambers in this case are 35 feet long, and extend athwart ship. When partially filled with water, the greatest weight is naturally at the lowermost side, and tends to keep that side down when the ship rolls in the opposite direction. It can not, however, keep it down altogether, and a considerable portion of the water finds its way across the chamber before the return roll takes place. Thus there is a constant tendency of the water toward the side that is about to roll upward, and the weight being shifted just at the critical moment, the equilibrium of the ship is partially preserved, and the uncomfortable rolling motion is largely diminished.

One feature, which adds greatly to the luxuriousness of the appointments, is the arrangement of the main saloon, which, instead of being of the proportions ordinarily dictated by the space between decks, is carried up through three of the five decks, having an arched roof 22 feet high, 58 feet long, and 25 feet wide.

The steering-apparatus has been designed specially with a view to the use of the vessels as armed cruisers in case of war. The plan of the rudder with one of the twin screws is given in Fig. 10. The rudders have a superficial area of 250 square feet, larger than has been adopted for the largest war-vessels, and

the power of the hydraulic steering machinery will be appreciated when it is known that the rudder can be crowded hard over when the ship is going full speed ahead. Of course, this implies a tremendous strain upon all the parts.

FIG. 10.—TWIN SCREW ON STEAMER.

The steering is effected by a small tiller, that being regarded as more certain of adjustment than the ordinary wheel. The illustration (Fig. 10) sufficiently shows the position of one of the twin screws, its mate, of course, being in position on the other side of the stern-post. The machinery in each vessel consists of two sets of engines of the three-crank, triple-expansion type. Each set of engines is capable of driving the vessel at a good rate of speed should the other engines break down.

The full complement of passengers and crew is in round numbers 2,000 souls, and the total amount of deck area is about 150,000 square feet. Duplicate electric-light systems are carried to all parts of the ship.

In actual performance the "City of New York" is said to have fully equaled the expectations of her builders, though she has not yet "broken the record" in running time. She encountered several very severe storms, however, and behaved admirably.

A Large Gas-Holder.—A conspicuous object to passengers on the East river, N. Y., is the large tank recently constructed for the Consolidated Gas Company of New York during the summer of 1888. The engineering difficulties were considerable, since the available land was "made ground" composed of city dumpings, and below this was quicksand. The usual subterranean brick tank was dispensed with, as being too expensive, and an iron tank was substituted, resting on the surface of the ground. To prepare for this, a circle of heavy piles was driven, corresponding with the diameter of the tank, and the inclosed space was filled with concrete to a thickness of two feet. On this the bottom plates of the tank were laid. The

FIG. 11.—THE EIFFEL TOWER.

Annenkoff. The line passes through some of the most inhospitable desert regions of the earth. The progress of the work was comparatively slow at first, and the major part of the line eastward from Kizil Arvat has been able existence, and in this he and his staff kept constantly near the track-layers. It is not probable that the line will prove attractive to tourists, since the scenery is monotonous in the extreme, and the romance of Eastern travel

largely disappears when the railroad takes the place of the caravan; but as a stimulant to native industries it must in the course of time prove highly effective. The line was formally opened on the anniversary of the Czar's coronation, May 27, 1888.

The Eiffel Tower.—This superb work was so nearly complete at the end of the year that its construction may be regarded as an accomplished fact. As a feature of the great Paris Exposition of 1889, it is certain to attract a large share of attention. The illustration is from a perspective drawing made by M. Hanin, of Paris, with a view to representing the tower exactly as it will look when finished. Photographs will of course distort the proportions even under the most favorable conditions. On December 31 the structure was about 800 feet high. The total height is to be 984 feet. It is intended merely as an ornamental observatory, though some important scientific observations may be made from its summit. The progress during the latter part of the work averaged 86 feet a week. In comparison with the Eiffel Tower, the heights of other lofty structures are of interest. Washington Monument, 555 feet; Cologne Cathedral, 512 feet; Strasburg Cathedral, 466 feet; St. Stephens, Vienna, 448 feet; St. Peter's, 433 feet; St. Paul's, 404 feet.

The Garabit Viaduct.—Among engineers M. Eiffel's reputation will gain more from the viaduct near Garabit, France, than from the Paris tower. The central arch of the viaduct is 540 feet span, and rests upon two large piers, the metallic part of which is 195 feet high. The total weight of the arch is 2,608,540 pounds. Cables were, of course, used to support the two parts of the arch. M. Eiffel found by experiment that an increase of half an inch in the length of the cables increased the tension 2,200 pounds. By introducing a half-inch wedge under the end of one of the cables, the neighboring cables were decreased in tension 2,200 pounds, distributed over the other cables as a whole. These latter, therefore, were contracted to an extent corresponding to such diminution of tension, and they consequently raised the arch. The totalization of the slight liftings due to the repetition of this manoeuvre on each of the cables finally effected a general lifting of four inches. When it was desired to lower the arch, the operation was just the contrary, that is to say, the wedges were removed in succession.

After the two halves of the arch had been brought so close together that there was room only for the insertion of the center-piece, the process of keying was begun. As the two halves had, during the mounting, been held a little above their final position, there was a few inches more space between them than was necessary for the insertion of the key, and it was only necessary to remove progressively a few wedges to bring the parts into contact.

This operation was effected with such pre-

cision that the key of the extrados was driven home with a few blows of the hammer, a wonderful instance of accurate calculation, considering the enormous size of the parts.

In April, before the viaduct was opened for travel, two tests were made, one with a sta-

tionary load of 405 tons, and the same load moving. The deflection in the first instance was 0.27 inch, and in the second 0.46 inch.

Subways for Electric Wires.—The multiplication of overhead electric wires in the streets is so

FIG. 13.—MANHOLE. METHOD OF HANDLING CABLES.

objectionable that measures have been taken in most of the world's great cities to place

them underground. According to the report of Dr. Schuyler S. Wheeler, of the New York Board of Electrical Control, New York has 4,458 miles of underground wires; Paris, 4,100; Brooklyn, 2,100; Chicago, 200; Boston, 400; and Pittsburg, 1,000. These figures probably considerably understate the mileage in operation at the end of 1888, but they are the latest available for the foreign cities. New York city has been to a more serious extent the victim of overhead wires than any other large city, and all sorts of devices, legal and otherwise, were resorted to in order that no change should be made. After long delays, laws

were passed sufficiently

nels of the Caucasus may be added to the list. The Novorossiisk branch of the Caucasus Railroad passes through two tunnels, the longer of which is 1,838 metres, and the shorter 365 metres in length. The Souram Tunnel of the Baku-Batoum Railway, which was opened on the 31st of October, is the largest tunnel in Russia, being 4.4 kilometres, or a mile and three quarters long. By its means the steep grades of the Souram Pass are avoided, and the petroleum trains, which formerly had to be divided at this point, are now able to pass to the Black Sea unbroken.

EPIDEMICS. At certain periods in the history of mankind certain diseases have attained such force as to affect large areas of territory and kill great numbers of men; and have then been known as epidemics. It is the design of this article to sketch the general history of the greatest of these epidemics.

The Black-Death.—One of the most memorable of the epidemics of the middle ages was a great pestilence in the fourteenth century, which devastated Asia, Europe, and Africa. It was an Oriental plague, marked by inflammatory boils and tumors of the glands, such as break out in no other febrile disease. On account of these boils and from the black spots (indicative of putrid decomposition) which appeared upon the skin, it has been generally called the black-death. The symptoms were many, though not all were found in every case. Tumors and abscesses were found on the arms and thighs of those affected, and smaller boils on all parts of the body; black spots broke out on all parts of the skin, either single, united, or confluent. Symptoms of cephalic affection were frequent; many patients became stupefied, and fell into a deep sleep, losing also their speech from palsy of the tongue; others remained sleepless, without rest. The fauces and tongue were black, and as if suffused with blood. No beverage would assuage the burning thirst. Contagion was evident, for attendants caught the disease from their relatives and friends. But still deeper sufferings were connected with this pestilence: the organs of respiration were seized with a putrid inflammation, blood was expectorated, and the breath diffused a pestiferous odor. The plague spread with the greater fury, as it communicated from the sick to the healthy; contact with the clothes or other articles which had been used by the infected induced the disease, and even the breath of the sick, who expectorated blood, caused a contagion far and near. As it advanced, not only men, but animals also fell sick and expired.

In England the plague first broke out in the county of Dorset, whence it advanced through the counties of Devon and Somerset to Bristol, and thence reached Gloucester, Oxford, and London. Probably few places escaped, perhaps not any, for the annals of contemporaries report that throughout the land only a tenth part of the inhabitants remained alive. From

of efficiency.

The system finally adopted is shown in the illustrations. Fig. 12 shows a conduit with its pipes partially covered in. On top of the main conduit is shown a section of the Edison incandescent illuminating system. Fig. 13 shows the interior of a manhole, and Fig. 14 the lamp-post adopted by the board with the store and house connections. The pipes are of iron four inches in diameter and in lengths of twenty feet. They are laid in hydraulic concrete to secure insulation, and the wires separately insulated are passed through them by means of a jointed rod, such as is used by chimney-sweepers, and may be taken out for examination or repair.

FIG. 14.—LAMP-POST DISTRIBUTION.

Railway Tunnels in Russia.—It is worthy of remark that, notwithstanding the very great extent of the Russian Empire, but few tunnels have had to be excavated for its railroads. Till recently tunnels have been used only in the Polish provinces and the Ural; now the tun-

England the contagion was carried by a ship to Norway, where the plague broke out in its most frightful form, with vomiting of blood, and in the whole country spared not one third. The sailors found no refuge on their ships, and vessels were often seen drifting on shore, whose crews had perished to the last man.

It is hard to measure the mortality of the black-death; some numerical statements are not, indeed wanting, but they are scarcely credible when we consider the civilization or lack of civilization of the fourteenth century. Rudeness was general. Witches and heretics were burned alive; wild passions, severity, and cruelty everywhere predominated. Human life was but little regarded. Cairo lost daily, when the plague was raging with its greatest violence, from 10,000 to 15,000. In China more than thirteen millions are said to have died. India was almost wholly depopulated. Tartary and the Tartar kingdom of Kaptshak, Mesopotamia, Syria, Armenia, were covered with dead bodies. Cyprus lost almost all its inhabitants, and ships without crews were seen driving about the Mediterranean, spreading the plague where they went ashore. It was reported to Pope Clement, at Avignon, that throughout the East (probably excepting China) 28,840,000 people had fallen victims to the plague. In Venice 100,000 died, and in London at least the same number, while 124,434 Franciscan friars died in Germany. In Avignon the Pope found it necessary to consecrate the Rhone, that bodies might be thrown into the river without delay. In Vienna, where for some time twelve hundred inhabitants died daily, the interment of corpses in the church-yards and within the churches was prohibited, and the dead were arranged in layers by thousands in large pits outside the city, as had been already done at Cairo and Paris and London. The palace and the cot alike felt the fury of the plague. One king, two queens (Alonso XI; Johanna, Queen of Navarre, daughter of Louis X; and Johanna of Burgundy, wife of King Philip de Valois), one bishop, and great numbers of other distinguished persons fell victims to it. The whole period of time during which the black plague raged with destructive violence in Europe was (with the exception of Russia, where it did not break out until 1851) from 1347 to 1350; from this latter date to 1888 there were various pestilences, bad enough indeed, but not so violent as the black-death.

Ireland was much less heavily visited than England, and the disease seems scarcely to have reached the mountainous regions of that land; and Scotland, too, would perhaps have remained free from it, had not the Scotch availed themselves of the discomfiture of the English to make an irruption into England, which terminated in the destruction of their army by the plague and the sword, and the extension of the pestilence through those who escaped over the whole country.

In Sweden two princes died (Haken and Knut, half-brothers of King Magnus), and in Westgothland alone 466 priests. The inhabitants of Iceland and Greenland found in the coldness of their inhospitable climes no protection against this enemy which invaded them. In Denmark and Norway the people were so occupied with their own misery that the accustomed voyages to Greenland ceased, and at the same time great icebergs formed on the coast of East Greenland, and no mortal from that time, even to the present day, has seen that shore or the former dwellers thereon.

It may be assumed that Europe lost by the black-death twenty-five million people, or about one fourth of her inhabitants. That her nations could overcome, as quickly as they did, this terrible loss, without retrograding more than they did, is a most convincing proof of the indestructibility of human society as a whole.

The Dancing Mania.—The effects of the black-death had not yet subsided, and the graves of millions of its victims were scarcely green, when a strange delusion arose. It was a convulsion that in the most extraordinary manner infuriated the human frame and excited the astonishment of contemporaries for more than two centuries. It was called in some portions of Europe the Dance of St John, or of St. Vitus, on account of the strange leaps by which it was characterized and which gave to those affected, while performing their wild dance and screaming and foaming with fury, all the appearance of persons possessed. It did not remain confined to particular localities, but was propagated by the sight of the sufferers over the whole of Europe.

As early as 1374 assemblages of men and women were seen at Aix-la-Chapelle who had come out from Germany, and, united by one common delusion, exhibited to the public, both in the streets and in the churches, a strange spectacle. They formed circles, hand in hand, and, losing all control over their senses, continued, regardless of the by-standers, dancing for hours together in wild delirium, until at length they fell to the ground in a state of exhaustion. Then they complained of extreme oppression, and groaned as if in the agonies of death, until cloths were bound tightly around their waists, when they recovered and remained free from complaint until the next attack. This practice of swathing was resorted to on account of the tympany that followed these spasmodic ravings; but the by-standers frequently relieved patients in a less artificial manner by thumping and trampling upon the parts affected. While dancing, they neither saw nor heard, being insensible to external impressions through the senses, but were haunted by visions, their fancies conjuring up spirits, whose names they shrieked out, and some of them afterward asserted they felt as if they had been immersed in a stream of blood, which obliged them to leap so high. Others during the paroxysm

saw the heavens open and the saints and Virgin Mary, according as the religious notions of the age were strangely and variously reflected in their imaginations. When the disease was completely developed, the attack began with epileptic convulsions. Those affected fell senseless, panting and laboring for breath. They foamed at the mouth, and, suddenly springing up, began their dance with strange contortions.

It was but a few months ere this disease had spread from Aix-la-Chapelle, where it appeared in July, over the neighboring Netherlands. In Liege, Utrecht, Tongres, and many other towns the dancers appeared with garlands in their hair and their waists girt with cloth bandages, that they might, as soon as the paroxysm was over, receive immediate relief from the attack of tympany. This bandage, by the insertion of a stick, easily twisted tight. Many, however, obtained more relief from kicks and blows, which they found numbers of persons ready to administer, for wherever the dancers appeared the people assembled in crowds to gratify their curiosity with the frightful spectacle. Peasants left their plows, mechanics their workshops, housewives their domestic duties, to join in the wild revels. Girls and boys quitted their parents, and servants their masters, to amuse themselves at the dances of those possessed, and greedily imbibed the poison of mental aberration.

The priests and the authorities took an interest in the afflicted, who were numbered by thousands. They divided them into separate parties, to each of which they appointed responsible superintendents to protect them, and so sent them on pilgrimages to chapels and shrines, principally to those of St. Vitus, near Zabern and Rotestrué, where priests were in attendance to work upon the misguided minds, and where it is probable that many were, through the influence of devotion, cured of this lamentable affliction. Yet in most cases music afforded the sufferers relief. At the sound of the flute or zithern they awoke from their lethargy, opened their eyes, and moving slowly at first, according to the measure of the music, were, as the time quickened, gradually hurried on to a most passionate dance. Throughout the summer season cities and villages resounded with the notes of musical instruments, and patients were everywhere met with who looked upon dancing as their only remedy.

There were more ancient dancing plagues. In the year 1287 upward of a hundred children were said to have been seized suddenly at Erfurt, and to have proceeded dancing and jumping along the road to Arnstadt. When they arrived at that place they fell exhausted to the ground, and, according to an old chronicle, many of them, after they were taken home to their parents, died, and the rest remained affected to the end of their lives with a permanent tremor. Another occurrence is related to have taken place at the Mosel bridge at Utrecht in 1278, when two hundred fanatics

began to dance, and would not desist when a priest passed by carrying the host to a person who was sick, upon which, as if in punishment, the bridge gave way and they were all drowned. A similar event is also said to have occurred as early as the year 1027. Eighteen peasants are said to have disturbed divine service on Christmas eve, by dancing and brawling in the churchyard, whereupon the priest inflicted a curse upon them that they should dance and scream a whole year without ceasing.

The Sweating-Sickness.—After the fate of England had been decided by the Battle of Bosworth, on Aug. 22, 1485, the joy of the nation was clouded by a strange disease, which, following in the rear of Henry's victorious army, spread in a few weeks from the distant mountains of Wales to the metropolis of the empire. It was a violent inflammatory fever, which, after a short rigor, prostrated the powers as by a blow, and amid painful oppression of the stomach, headache, and lethargic stupor, suffused the whole body with a fetid perspiration. All this took place in a few hours, and the crisis was always over within the space of a day and a night. The internal heat that the patient suffered was intolerable, yet every refrigerant was certain death. At first the new foe was scarcely heeded; citizens and peasants went in joyful procession to meet the victorious army, for the nation, after its many years of civil war, looked forward to happier days of peace. Very shortly, however, after the King's entry into the capital on the 28th of August, the sweating-sickness, as the disease was called, began its ravages among the dense population of the city. Two lord mayors and six aldermen died within one week; many who had been in perfect health at night were on the following morning numbered with the dead. The disease for the most part marked for its victims robust and vigorous men, and, as many noble families lost their chiefs, extensive commercial houses their principals, and wards their guardians, the festivities were soon changed into mourning and grief. By the end of the year the disease had spread over the whole of England. Many persons of rank, of the ecclesiastic and civil classes, became its victims, and great was the consternation when it broke out in Oxford. Professors and students fled in all directions, but death overtook many of them, and the university was deserted for six weeks. The accounts that have been handed down are very imperfect, but we may infer from the general grief and anxiety, that the loss of life was very considerable.

In the summer of 1506 the sweating-sickness visited England for a second time. The renewed eruption of the epidemic was not on this occasion connected with any important occurrence, so that contemporaries have not even mentioned the month when it began; and in the autumn it disappeared.

A third time, in 1517, the sweating-sickness broke out, and was so violent and rapid in its

course that it carried off those who were attacked in two or three hours, so that the first shivering fit was regarded as the commencement of certain death. Among the poorer classes the deaths were innumerable, and no precautions averted death from the houses of the rich. This time the sweating-sickness lasted six months, and reached its height about six weeks after its first appearance.

But a heavier affliction was in store. In May, 1528, the sweating-sickness again broke out in England, and fourteen months later brought a scene of horror upon all the nations of Northern Europe scarcely equaled during any other epidemic. It appeared at once with the same intensity it had shown before, and ushered in by no previous indications, and between health and death there lay but a brief term of five or six hours. Once or twice again this fearful epidemic visited localities in Europe, but by the autumn of 1551 it had vanished from the earth.

Yellow Fever.—The New World has contributed its quota to the epidemic diseases that afflict humanity. There is reason to believe that yellow fever existed among the native tribes of Central America and the West Indies for many years prior to the discoveries of Columbus, while it is certain that before that date it was unknown in Europe, and probably unknown in Asia and Africa. The history of general literature, and especially of medical science, from 1492 till a comparatively recent period is not only scanty but almost buried under a mass of illiteracy and quackery. It is therefore hard to find trustworthy records of the appearance of yellow fever until within the last century or century and a half. There is, however, reason to suspect that the Spaniards in San Domingo suffered from yellow fever during the first year (1493) they passed on that island; it is more certain that they did suffer in 1494, the year that is usually given as the first when white men were attacked with the disease.

The scanty and unsatisfactory records for the one hundred and forty-four years from 1493 to 1685 justify the belief that not fewer than nineteen yellow-fever epidemics occurred in Santo Domingo, Porto Rico, and the Isthmus of Darien, while it is probable that Mexico has yearly suffered from the disease since the foundation of Vera Cruz in 1519.

One of the curious and ridiculous theories at one time believed by the credulous attributed the yellow fever to the importation of slaves from Africa. The first three hundred Africans were brought to Cuba in 1521 or 1523, and during the succeeding two hundred and forty-two years about 60,000 more were imported; but after 1763 the importation increased so enormously that in 1774 Cuba had a colored population of 75,180. In 1762 Havana was besieged, captured, and held by a force of 30,000 English soldiers and sailors. During that year the disease claimed many victims, and was prob-

ably for the first time carried by invalid officers or men into Great Britain, so that it is not surprising that many historians should have erred in saying that the disease first appeared in this year; yet there are ample proofs that it was an epidemic in Havana the year previous (1761).

From 1685 the historical record of the visitations of yellow fever becomes more and more authentic, and no doubt is entertained that the first European settlers in Guadeloupe, in 1685, suffered severely. During the ensuing one hundred and twenty-eight years, from 1685 to 1762, history records 208 invasions of yellow fever in eighty-six of these years in 48 different localities. Among these there were in what are now the United States, from 1691 or 1693 (when Boston was invaded by yellow fever—its first positive appearance in this country) to 1762, not fewer than 44 epidemics in 12 different places.

It is contended by some authorities that epidemics of yellow fever are not indigenous to the United States, but due wholly to importation from foreign lands, such as the West Indies, and notably from Cuba, between which and the United States about 2,000 vessels ply annually, carrying goods amounting to more than seventy million dollars.

Thus, in Florida there has never been an epidemic of yellow fever that could not be demonstrably traced to direct importation from abroad. The epidemic of 1841, at St. Augustine, was imported from Havana; that of 1822, at Pensacola, from the same place; that of 1825, at Pensacola, from the West Indies; that of 1834, at Pensacola, was imported in war-vessels; that of 1839, at St. Augustine, was carried thither from Charleston, S. C.; that of 1839, at Pensacola, was carried from Mobile and New Orleans; that of 1841, at St. Augustine, was imported from Havana; those of 1842, 1843, 1844, 1845, 1846, and 1847, at Pensacola, were imported in war-vessels; those of 1862 and 1865, at Key West, were imported from Havana; that of 1867, at Pensacola, was imported from Jamaica; that of 1869, at Key West, was imported from Cuba; that of 1871, at Cedar Keys and Tampa, from Havana; those of 1873 and 1874, at Pensacola, from Havana, as was also the scourge that devastated the little seaport town of Fernandina in 1877, and the more recent epidemic of 1888.

The following is a statement of the principal localities in the United States where yellow fever has appeared, with their elevations above sea-level, dates of beginning and suspension of the disease, and mortality when known:

Alabama.—Blakely, 25 feet, 1822. Cahawba, 175 feet, 1821. Citronelle, 65 feet, 1853. Dog River Factory, 30 feet, 1853. Demopolis, 125 feet, 1853. Fort Claiborne, 75 feet, from July 4 to Dec. 1, 1819. Fort Morgan Island, 20 feet, Aug. 13, 1867. Fort St. Stephen, 75 feet, July 4 to Dec. 1, 1819. Hollywood, 75 feet, 1853. Mobile, 20 feet, 1705; 1765; 1766; 1819; 1821; 1822; 1824; 1825; 1827; 1828; Sept. 14, 1829, mortality 130; Sept. 20, 1837, mortality 350; 1838;

Aug. 11 to Oct. 20, 1839, mortality 650; 1841; Aug. 30, 1842, mortality 60; Aug. 18 to Nov. 5, 1843, mortality 240; 1844; 1847, mortality 76; 1848, mortality 75; 1849, mortality 60; 1851; July 18 to Nov. 1, 1853, mortality 1,161; 1854; Sept. to Nov., 1855, mortality 30; 1858; Aug. 18, 1867; Sept. 4 to Nov. 10, 1873, mortality 102. Montgomery, Sept. to Nov., 1853, mortality 35; Sept. to Nov., 1854, mortality 45; Aug. 22 to Nov. 19, 1870; Aug. 21 to Nov. 29, 1873, mortality 27. Pollard, 60 feet, 1873. Selma, 200 feet, 1824; Sept. 17 to Nov. 13, 1853, mortality 32; 1854; 1855.

Arkansas.—Spring Hill, 50 feet, 1853. Columbia, 135 feet, June, 1853. Fort Smith, 450 feet, 1823. Grand Lake, 130 feet, 1853. Little Rock, 350 feet, 1873. Napoleon, 142 feet, 1853.

Connecticut.—Chatham, 200 feet, Aug. 29, 1796. Hartford, 60 feet, 1798; 1800. Knowles Landing, 25 feet, Aug., 1796, mortality 9. Middletown, 40 feet, June, 1820. New Haven, 35 feet, 1748; 1794; 1803; 1804; 1805; 1819. New London, 25 feet, Aug. 26 to Nov., 1798, mortality 81. Norwalk, 25 feet, 1798. Stamford, 20 feet, 1745. Stonington, 20 feet, 1798.

Delaware.—Christiana, 20 feet, 1798. Duck Creek, 20 feet, 1798. Newcastle, 25 feet, 1798. Wilmington, 45 feet, 1798, mortality 250; 1802, mortality 86.

Florida.—Apalachicola, 15 feet, 1826. Cedar Keys, 15 feet, 1871. Gainesville, 160 feet, Aug., 1871. Jacksonville, 15 feet, 1857. Key West, 15 feet, 1824; 1829; June, 1841, mortality 26; Aug., 1853, mortality 112; 1854; June 20 to Oct., 1862, mortality 71; 1864; 1865; 1867; 1869. Milton, 20 feet, 1853. Pensacola, 15 feet, 1764; 1765, mortality 125; 1811; Aug. to Oct. 10, 1822, mortality 257; 1825; 1827; 1834; 1839; 1841; 1843; 1844; 1845; 1846; 1847; 1848; July 9, 1853; 1854; 1858; Aug. 25, 1863; July 24, 1867, mortality 34; Aug. 6, 1873, mortality 61; 1874. St. Augustine, 10 feet, 1807; Aug., 1821, mortality 140; 1838; Aug. 15, 1839; 1841, mortality 26. St. Joseph's, 15 feet, 1841. Suwanee, 60 feet, 1836. Tampa, 20 feet, 1839; Sept., 1853; 1871. Tortugas, 12 feet, 1862, mortality 4; July 4, 1867, mortality 38. Pensacola Bay, Aug. 14 to Nov. 19, 1873, 62.

Georgia.—Augusta, 185 feet, 1839; 1854. Bainbridge, 120 feet, 1873. Columbus, 1854, mortality 3. St. Mary's, 15 feet, Sept. 5 to Oct., 1808, mortality 84. Savannah, 30 feet, 1807; 1808; 1819; 1820; 1827; 1852, mortality 19; 1853; Aug. 5, 1854, mortality 580; 1858.

Illinois.—Cairo, 322 feet, Sept. 1 to Sept. 25, 1873, mortality 17.

Kentucky.—Louisville, 450 feet, Sept. 22 to Oct. 15, 1873, mortality 5.

Louisiana.—Alexandria, 75 feet, 1819; 1822; 1827; 1831; 1837; 1839; 1847; 1853; 1854; Sept. 13, 1855. Algiers, 10 feet, 1847; 1853; 1858. Ascension, 25 feet, 1823. Baton Rouge, 50 feet, 1817; 1819; 1822, mortality 60; 1827; 1829; 1837; Oct., 1843; 1847; 1858. Bay of St. Louis, 10 feet, Aug., 1820. Bayou Sara, 75 feet, 1847; 1853. Burat Settlement, 10 feet, Sept. 22, 1854. Carrollton, 15 feet, 1847; May 18, 1855. Centreville, 20 feet, Sept. 18 to Nov. 18, 1853; Sept. to Oct., 1855. Clinton, 85 feet, Sept. 1 to Dec., 1853, mortality 75. Cloutierville, 175 feet, Aug. 14 to Dec. 14, 1853; 1854. Covington, 25 feet, 1847. Donaldsonville, 30 feet, 1828; 1830, mortality 30. Franklin, 15 feet, Oct. 19 to Nov. 24, 1853; 1854. Gretna, 1858. Iberville, 28 feet, (dates not recorded.) Jeanerrotte, 15 feet, Oct. 7, 1854. Jesuits Bend, 10 feet, Sept. 12, 1854. La Fayette, 12 feet, June 22, 1847. Lake Providence, 100 feet, 1853. Mandeville, 15 feet, 1847. McDonoughville, 1853. Natchitoches, 180 feet, 1839. New Iberia, 30 feet, 1839; 1867; 1870. New Orleans, 10 feet, 1796; 1791; 1792; 1794; 1795; 1796; 1797; 1799; 1800; 1801; 1802; 1804; 1809; 1811; 1812; June 18 to Dec., 1817, mortality 800; 1818, mortality 115; July 1, 1819, mortality 2,190; July, 1820; Sept. 1, 1822, mortality 239; Aug. 23, 1823; Aug. 4, 1824, mortality, 108; June 23, 1825, mortality, 49; May 18, 1826, mortality 5; July 19, 1827, mortality, 109; June 18, 1828, mortality 130;

May 23, 1829, mortality 215; July 15, 1830, mortality 117; June 9, 1831, mortality 2; Aug. 15, 1832, mortality 13; July 12, 1833, mortality, 210; Aug. 28, 1834, mortality 95; Aug. 23, 1835, mortality 284; Aug. 24, 1836, mortality 5; July 24, 1837, mortality 442; Aug. 25, 1838, mortality 17; July 23, 1839, mortality 459; July 25, 1840, mortality 5; July 27, 1841, mortality 594; July 30, 1842, mortality 211; July 5, 1843, mortality 487; July to Sept., 1844, mortality 148; 1845, mortality 2; Aug. to Oct., 1846, mortality 160; Aug. to Dec., 1847, mortality 2,259; June to Nov., 1848, mortality 850; Aug. to Dec., 1849, mortality 737; July to Oct., 1850, mortality 102; 1851, mortality 16; July to Dec., 1852, mortality 415; May to Dec., 1853, mortality 7,970; July to Dec., 1854, mortality 2,423; June to Dec., 1855, mortality 2,670; Aug. to Nov., 1856, mortality 74; June to Dec., 1857, mortality 199; June to Oct. 10, 1858, mortality 3,889; 1862; 1863; 1864; June 10 to Dec. 22, 1867, mortality 3,063; May 16 to Dec., 1870, mortality 587; Aug. 4 to Oct., 1871, mortality 55; Aug. 28 to Nov. 30, 1872, mortality 225; July 4 to Nov. 18, 1873, mortality 225. Opelousas, 60 feet, 1829; Oct. 20 to Nov., 1837; Aug. to Nov., 1839; 1842; 1853; 1867. Pattersonville, 20 feet, Aug. 8 to Dec., 1853, mortality 45; Sept., 1854; Sept., 1855. Plaquemine, 6 feet, 1837; 1839; 1847; Sept. to Oct., 1853; 1858. Point a la Hache, 8 feet, Oct., 1854. Port Barre, 1870; Port Hudson, 75 feet, 1839; Oct. 13, 1841; 1843. St. Francisville, 80 feet, 1811. West Feliciana Parish, 1817; 1819; 1823; 1827; Sept. 22, 1829; Aug. 23, 1839; Aug. 23, 1833; 1839; 1843; 1846; 1848; 1853. St. John Baptiste, 20 feet, 1853. St. Martinville, 20 feet, 1839. St. Mary's Parish, 15 feet, Sept. to Oct., 1854; Shreveport, 220 feet, Sept. to Dec., 1853; Aug. 12 to Nov. 10, 1873, mortality 1,759. Thibodeaux, 15 feet, 1853, mortality 160; Sept. 12 to Oct., 1854. Trenton, 80 feet, 1853. Trinity, 175 feet, Aug. to Oct., 1865. Vidalia, 175 feet, Aug., 1853. Ville Platte, 60 feet, 1870. Washington, 65 feet, 1837; 1839; 1852; Aug. 15, 1853; 1854; 1867.

Maryland.—Baltimore, 60 feet, 1794; 1795; Aug. to Nov., 1797; 1798; 1799; 1800; 1801; 1802; 1805; July 21 to Oct. 30, 1819; 1820; 1821; 1822; 1868. West River, 15 feet (dates not recorded.)

Massachusetts.—Boston, 45 feet, 1691; 1693; 1795; 1796; 1798, mortality 200; 1800; 1802, mortality 60; 1805; 1819; 1858. Holliston, 75 feet, 1741, mortality, 15. Nantucket, 20 feet, 1741, mortality 259. New Bedford, 25 feet, 1800; 1801. Newburyport, 20 feet, 1796. Salem, 20 feet, 1798.

Mississippi.—Biloxi, 10 feet, 1702; 1839; 1847; 1853; 1858. Brandon, 300 feet, Sept. 15, 1853; Sept. 23 to Nov. 18, 1854. Canton, 320 feet, 1853. Clifton, 175 feet, Aug. 28 to Oct., 1853. Cooper's Wells, 275 feet, Aug. 23, 1855, mortality 13. Grand Gulf, 200 feet, 1853. Greenwood, 140 feet, 1853. Jackson, 275 feet, 1853; 1854. Natchez, 150 feet, Sept. to Nov. 9, 1817, mortality 9; Sept. to Dec., 1819, mortality 180; Aug. 10 to Oct. 18, 1823, mortality 312; Aug. 20 to Nov. 1, 1825, mortality 150; 1827; Sept. 1 to Nov. 1829, mortality 90; Sept. 8 to Nov. 25, 1837, mortality 280; Sept. to Nov. 1839, mortality 235; 1844; June to Nov. 1848; July 17, 1853; 1855; 1858. Pascagoula, 10 feet, 1847; 1853. Pass Christian, 15 feet, 1847; 1853; 1855; 1858. Petit Gulf Hills, 200 feet, 1853. Port Gibson, 200 feet, 1853. Rodney, 175 feet, 1829; Sept. 6, 1843; 1847; 1853. Shieldsborough, 10 feet, Aug. 20, 1820; Aug. 5, 1829; 1839. Vicksburg, 175 feet, 1839; Sept. to Oct., 1841; 1847; 1853; 1871. Washington, 175 feet, Aug. to Nov., 1825, mortality 52. Whitell's Landing, 125 feet, 1817. Woodville, 100 feet, 1844; 1852; Aug. 9, 1853; Sept., 1855; 1858. Yazoo City, 140 feet, Sept. 1, 1853.

Missouri.—St. Louis, 475 feet, 1854; Aug. 14, 1855. New Design, 420 feet, 1797, mortality 57.

New Hampshire.—Portsmouth, 40 feet, Aug. to Oct. 1798, mortality 100.

New Jersey.—Bridgeton, 50 feet, 1798. Gloucester City, 20 feet, 1805. Perth Amboy, 20 feet, 1811, mor-

talities 5. Port Elizabeth, 20 feet, Aug. 9 to Sept., 1798. Woodbury, 1798.

New York.—Albany, 85 feet, Aug., 1746, mortality 45; 1798. Bay Ridge, 20 feet, July 18, 1856. Brooklyn, 40 feet, July to Sept., 1809, mortality 40; 1828; July 14, 1856. Catskill, 50 feet, 1748; 1794; Aug. 10 to Sept. 28, 1808, mortality 8. Governor's Island, 25 feet, July 29, 1856; Sept. to Oct. 28, 1870, mortality 49. Gowanus, 15 feet, 1856. Greenfield, 150 feet, 1798; Huntington, 20 feet, 1795; 1798. New York city, 35 feet, 1668; 1702, mortality 570; 1782; 1741; 1742; 1743, mortality 217; 1745; 1747; 1748; 1782; 1790; Aug. to Oct. 15, 1791; 1792; 1798; 1794; July 19, 1795, mortality 730; 1796; 1797; Aug. to Nov., 1798, mortality 2,080; July to Nov., 1799, mortality 76; Sept. to Oct. 14, 1800, mortality 21; Sept. to Oct., 1801, mortality 16; 1802, mortality 2; July 18 to Oct., 1808, mortality 700; June to Oct., 1805, mortality 840; June to Nov., 1806; 1807, mortality 8; 1808, mortality 1; 1809, mortality 2; 1810, mortality 1; 1815, mortality 7; 1816; 1817, mortality 4; 1818, mortality 4; Aug., 1829, mortality 37; 1820, mortality 2; 1821, mortality 16; July 10 to Nov. 5, 1822, mortality 230; 1823, mortality 5; 1824, mortality 8; 1825, mortality 1; 1826, mortality 2; 1827, mortality 4; 1828; 1829; 1830, mortality 1; 1832, mortality 1; 1833, mortality 2; 1834, mortality 1; 1835, mortality 2; 1838, mortality 8; 1839, mortality 9; 1843, mortality 5; 1844, mortality 4; 1846; 1847; Aug. 12, 1848, mortality 12; 1852, mortality 1; 1853, mortality 14; 1854, mortality 20; 1855, mortality 5; 1872; May 23 to Oct., 30, 1873, mortality 18. Queensborough, 1801. Red Hook, 30 feet, 1856. Staten Island, 20 feet, Aug. 23, 1848; July 14 to Oct. 28, 1856, mortality 25. West Neck, 18 feet, 1795. West Point, 25 feet, 1804. Yellow Hook, 20 feet, 1856.

North Carolina.—Beaufort, 8 feet, 1854; Sept. 24 to Nov. 17, 1864, mortality 68; 1871. Smithville, 15 feet, 1862. Washington, 35 feet, 1800. Wilmington, 25 feet, 1796; 1800, Aug. 9, 1821; Aug. 6 to Nov. 27, 1862, mortality 446.

Ohio.—Cincinnati, 550 feet, 1871; 1873, Gallipolis, 520 feet, 1796.

Pennsylvania.—Bald Eagle Valley, 550 feet, 1799. Chester, 25 feet, 1798, mortality 50. Chester County, 1805. Kensington, 15 feet, 1798; Lisburn, 250 feet, Aug., 1803. Marcus Hook, 15 feet, 1798. Nittany, 550 feet, 1799. Philadelphia, 35 feet, 1695; Aug. 1, 1699, mortality 220; 1732; 1741, mortality 250; 1742; 1743; 1744; 1747; Aug. to Nov., 1762; 1791; Aug. 15 to Dec., 1793, mortality 4,041; 1794; 1796; Aug. 1 to Oct. 15, 1797, mortality 1,300; Aug. 1 to Nov. 1, 1798, mortality 3,500; July to Nov., 1799, mortality 1,000; 1800; 1801; 1802, mortality 307; 1803, mortality 195; 1805, mortality 400; 1807, mortality 8; 1809; 1810, mortality 3; 1811, mortality 5; 1813, mortality 6; 1814, mortality 7; 1815, mortality 2; 1816, mortality 2; 1819, mortality 13; July 24, 1820, mortality 33; July 19 to Oct., 1853, mortality 128; 1854; June 29, 1870, mortality 18. Southwalk, 20 feet, 1793.

Rhode Island.—Block Island, 20 feet, June to Dec., 1801. Bristol, 20 feet, 1795; 1796; 1797. Newport, 20 feet, 1806. Providence, 35 feet, 1794; 1795, mortality 45; Aug. 13, 1797, mortality 45; 1800; July 19 to Aug., 1805. Westerly, 25 feet, 1798; 1805.

South Carolina.—Charleston, 10 feet, 1699; 1703; 1728; May to Oct., 1732, mortality 12 daily; 1734; 1739; 1745; 1748; 1753; 1755; 1761; 1762; 1768; 1770; 1792; 1794; 1795; 1796; 1797; 1798, mortality 239; 1800, mortality 184; 1802, mortality 96; 1803; 1804, mortality 148; 1805; 1807, mortality 162; 1812; July to Nov., 1817, mortality 272; Aug. to Oct., 1819, mortality 177; June to Aug., 1822, mortality 2; Aug. to Nov., 1824, mortality 285; Aug. to Sept., 1825, mortality 2; Aug. to Nov., 1827, mortality 64; Aug. to Sept., 1828, mortality 26; Sept. to Nov., 1830, mortality 30; Aug. to Oct., 1834, mortality 49; Aug. to Sept., 1835, mortality 25; Aug. to Nov., 1838, mortality 351; June to Oct., 1839, mor-

talities 184; Aug. to Oct., 1840, mortality 22; 1843; Aug. to Nov., 1849, mortality 125; Aug. to Nov., 1852, mortality 210; Aug. to Nov., 1854, mortality 627; Aug. to Nov., 1856, mortality 211; Sept. to Nov., 1857, mortality 18; July to Dec., 1858, mortality 717; 1862; 1864; July 19 to Nov., 1871, mortality 213. Beaufort, 10 feet, Aug. 6 to Nov. 21, 1871, mortality 7. Columbia, 200 feet, 1854. Fort Moultrie, 15 feet, 1852; Aug. 15, 1858. Georgetown, 10 feet, Aug. 20 to Oct. 28, 1854. Hilton Head, 10 feet, Sept. 8 to Oct. 25, 1862. Mount Pleasant, 10 feet, 1817; 1848; 1852; 1854; 1856; 1857.

Tennessee.—Memphis, 260 feet, 1853; 1855; 1866; Sept. 14 to Nov. 9, 1873, mortality 1,244.

Texas.—Alleyton, 250 feet, Sept. 4 to Dec., 1867, mortality 45. Anderson, 200 feet, 1867. Austin, 450 feet, 1867. Bastrop, 260 feet, 1867. Beaumont, 50 feet, 1863. Belleville, 180 feet, 1855. Brazoria, 20 feet, 1859. Brenham, 350 feet, Aug. 11 to Oct. 31, 1867, mortality 120. Brownsville, 25 feet, Sept. 23 to Dec. 23, 1853, mortality 50; Aug. to Nov., 1858, mortality 41; 1862. Calvert, 325 feet, Oct. 12, 1867, to Jan. 10, 1868, mortality 250; 1878. Chapel Hill, 200 feet, Aug. 6 to Dec., 1867, mortality 123. Columbus, 250 feet, 1873. Columbia, 25 feet, 1833, mortality 132. Corsicana, 425 feet, 1878. Corpus Christi, 15 feet, 1862; Aug., 1867; 1878. Cypress City, 60 feet, 1853; 1859. Danville, 160 feet, 1867. Edinburg, 100 feet, July, 1859, mortality 13. Goliad, 50 feet, July 12, 1867, mortality 23. Galveston, 5 feet, Sept. 30 to Oct. 11, 1839, mortality 250; July 5, 1844, mortality 400; Oct. 1 to Nov. 25, 1847, mortality 200; Aug. 16 to Nov. 28, 1853, mortality 536; Aug. 9 to Nov. 5, 1854, mortality 404; Aug. 27 to Nov. 14, 1858, mortality 344; Sept. 17 to Nov. 30, 1859, mortality 182; Sept. 1 to Nov. 20, 1864, mortality 259; 1866; June 26 to Nov., 1867, mortality 1,150. Harrisburg, 55 feet, 1867. Hempstead, 166 feet, 1859; Aug. 9, to Nov. 26, 1867, mortality 151. Hockley, 50 feet, 1853. Houston, 37 feet, 1839; 1844; 1847; 1848; 1853; 1854; 1858; 1859; 1864; 1870. Huntsville, 200 feet, Aug. 9 to Oct. 19, 1867, mortality 130. Independence, 250 feet, 1867. Indianola, 10 feet, Sept., 1852; 1853; 1858; 1859; 1862; June 20, 1867, mortality 80. La Grange, 450 feet, Aug. to Nov., 1857, mortality 200. Liberty, 40 feet, 1867. Liverpool, 25 feet, Aug., 1858, mortality 4. Matagorda, 15 feet, 1862, mortality 120; 1863. Millican, 300 feet, 1864; Oct. 15 to Nov. 12, 1867, mortality 4. Montgomery, 180 feet, 1859. Navasota, 200 feet, Aug. 12 to Dec., 1867, mortality 154. Oldtown, 20 feet, Oct. 13, 1867. Port Lavaca, 15 feet, July 3 to Oct., 1867. Richmond, 125 feet, 1853; 1859. Rio Grande City, 200 feet, 1867, mortality 150. Sabine City, 10 feet, July to Oct. 1, 1863, mortality 14. Saluria, 10 feet, 1853. Sugarland, 100 feet, 1859. Victoria, 50 feet, Aug. 1 to Dec. 25, 1867, mortality 200.

Virginia.—Alexandria, 25 feet, Aug. 1, 1803, mortality 200. City Point, 15 feet, 1798. Gosport, 20 feet, 1855. Hampton Roads, 1869. Norfolk, 20 feet, 1747; 1794; 1795; 1796; 1797; 1798; 1799. July 26 to Oct. 30, 1800, mortality 250; 1801; 1802; 1803; 1804; 1805; Aug. 1, 1821; Sept. 1, 1826; 1845; Aug. 7, 1852; Oct. to Nov. 2, 1854, mortality 3; June 30 to Oct., 1855, mortality 1,807. Petersburg, 20 feet, 1798. Portsmouth, 20 feet, 1852; 1854; Aug. 1 to Oct., 1855, mortality 1,000. Richmond, 50 feet, 1806. Scotts Creek, 15 feet, June 29, 1855. Winchester, 700 feet, July, 1804.

The yellow-fever epidemic of 1888 was confined to Florida and parts of Alabama and Georgia. It began in August and ended about November; the mortality, all told, being probably not more than one thousand.

It will be apparent from these statistics that the methods of recording the rise, progress, duration, and extent of epidemic diseases are as yet by no means perfect. The historian

and the physician alike meet with this obstacle in their researches. A wise and enlightened public opinion, recognizing the advantage of close observation and of permanent record, may in the future remove this obstacle and governmental records afford the student more facts and therefore more facilities to learn aright.

Small-pox.—Small-pox is not indigenous to either Europe or America. Into the former continent it was introduced, by the Saracens, from Africa, about 622 and 710 A. D. Its early history is shrouded in obscurity. Of its origin we know nothing, but we do know now that it never occurs save as a consequence of infection conveyed from one person to another.

On its first introduction it ravaged Spain, then spread over Europe, sparing, however, for a time such isolated countries as Denmark, where it did not appear until 1527. It was carried to the West Indies in 1517, and reached Mexico in 1520 and Brazil in 1563. Farther north it first appeared in Maryland, having been brought there by an English ship in the early part of the seventeenth century. Thence it spread rapidly through Virginia, the Carolinas, New England, and other portions of the colonies.

The epidemic force of small-pox was, however, broken by the discoveries of inoculation and vaccination. Lady Mary Wortley Montague introduced inoculation for the small-pox from Turkey, her son having been successfully inoculated in 1718. She was allowed by way of experiment to inoculate seven convicts who, on recovery, were pardoned. A small-pox hospital was opened in London in 1746, but inoculation had not been universally adopted when Jenner, in 1796, discovered the safe and sure method of vaccination with the *pus* from cow-pox. The last notable visitation of small-pox began in 1870, running over all of Europe and America, and abating in 1878.

Cholera.—After the discovery of vaccination by Jenner had quelled the ravages of small-pox, Europe enjoyed comparative immunity from epidemics until the appearance of a new pestilence (the cholera) before unheard of there. Long known in India, this disease first began to attract the attention of Europeans in 1817. So slow, so steady, so even in its progress is the march of cholera, that it has been said to average the daily journey of a man.

In the month of August, 1817, cholera broke out in India in two separate places, viz., at Chittagong and Jessore. In 1818 it attacked Calcutta and invaded Hindustan. Ceylon and Malacca, Burmah and Sumatra, were attacked the following year. Java, Borneo, and the Philippines were attacked in 1820, and in 1821 Persia, Syria, and China. Not until 1828 did the cholera reach the frontier of Europe, where it finally spent its strength along the shores of the Caspian Sea.

A short respite followed this first invasion, and the plague slept until 1829; but in this

fatal year it moved from Persia to Bokhara, Tartary, the shores of the Caspian Sea, ravaged Siberia, and even penetrated into Russia. In 1830 the plague desolated the empire of the Czar, entering Moscow on the 20th of September. The ravages were frightful. In two months 4,385 persons died. Still creeping slowly westward, in August, 1831, the plague invaded Prussia and Austria, slaying 1,400 in Berlin and 2,000 in Vienna. From these points it spread widely. The Baltic provinces suffered first, after which, leaping the North Sea, it entered Great Britain, and on Jan. 27, 1832, broke out in Edinburgh, and on February 10 in London.

This epidemic seems to have entered France from England. On the 15th of March, 1832, it was at Calais, and on the 28th of the same month at Paris, whence it extended to Holland, and in 1833 to Portugal. Spain suffered in 1834. The mortality was very great. During the six months that the cholera raged in Paris it found 18,406 victims out of a total population of 645,698, or 28 deaths for 1,000 of inhabitants. Switzerland alone of all the nations escaped its visitations.

On June 8, 1832, the cholera made its first appearance in Quebec, Canada, having undoubtedly been transmitted from Great Britain. Thence it spread rapidly over the American continent.

The second visitation of cholera was no less deadly than the first. From 1837 to 1847 Europe had been free from it, but India had suffered during the entire decade. In 1845, however, the plague appeared in Tartary and a few months later in Persia, whence it spread rapidly to Egypt *via* Bagdad and Mecca. In 1847 it had reached the shores of the Caspian Sea, and in the autumn of the same year appeared almost simultaneously in Moscow and Constantinople. Not until early in 1848 did it appear in St. Petersburg, but very quickly afterward it was found in Poland, Holland, France, Belgium, and England. From France the epidemic spread to Italy (Switzerland being again spared) and to the Mediterranean nations. It reached the United States in 1849, ravaging various portions of the country from May to November, and was particularly severe in the Mississippi valley.

The third visitation of cholera differed from the two preceding, in that it did not start from India, but originated in the Baltic states, appearing at Copenhagen in July and August, 1853. Upon this occasion the spread of the plague was unusually rapid, and nearly all of Europe was visited by it before the end of the year. By July, 1854, it had made its appearance in Northern Africa and Western Asia. It raged with violence among the armies in the Crimea.

The fourth and last epidemic came from the East, reaching Europe through Persia, Mecca, Suez, and Egypt, and entering France through the port of Marseilles, in June, 1865. It rav-

aged Europe until 1867, when it disappeared. The epidemic reached the United States in 1865, and was most severe in the West, especially at Chicago, St. Louis, and Nashville. The mortality in the East was comparatively light, the deaths in New York being 588, and in Brooklyn 578. An epidemic of cholera visited the Mississippi valley in 1873.

EVANGELICAL ASSOCIATION. The "Family Christian Almanac" of the Evangelical Association gives statistics of that body for 1888, of which the following is a summary: Number of conferences (including those of Germany, Switzerland, and the Japan mission), 26; whole number of members, 141,858; number of baptisms—2,560 of adults and 9,528 of infants; of itinerant preachers, 1,159; of local preachers, 647; of churches, 1,916, having a total probable value of \$4,561,862; probable value of parsonages, \$723,251; amount of collections for the Missionary Society, \$107,511; for the Sunday-school and Tract Union, \$2,671; for the Orphan Home, \$4,614; for "Conference Claimants" (worn-out ministers and the widows and children of deceased ministers), \$7,051; number of Sunday-schools, 2,404, with 29,910 officers and teachers, and 165,255 pupils; number of catechetical classes, 728, with 9,358 catechumens.

EVENTS OF 1888. The year was, upon the whole, remarkable for an absence of conspicuously noteworthy events. The general election in the United States, resulting in a peaceful revolution in political affairs, was the most important to Americans; while to Europeans, the sickness and death of the two German Emperors was for months the principal subject of interest. The wars that have been waged have been in remote corners of the earth, and most of the victories that have been gained have been in the way of scientific or commercial progress.

January 1. Grand Pontifical high mass celebrated in St. Peter's, Rome, in honor of the Pope's Jubilee—the fiftieth anniversary of his consecration as a priest.

5. Committees announced in the House of Representatives by Speaker Carlisle. France: Senatorial elections; the Republicans lost three seats.

8. Completion of the Mexican International Railway. Lucius Q. C. Lamar resigns the Secretaryship of the Interior to accept a seat in the United States Supreme Court.

11. Kentucky: J. B. Beck re-elected to the United States Senate.

12. Gen. E. S. Bragg nominated to be United States Minister to Mexico; confirmed by the Senate. The Senate confirms the following nominations: Don M. Dickinson to be Postmaster-General, William F. Vilas to be Secretary of the Interior.

16. L. Q. C. Lamar confirmed by the Senate as Associate Justice of the Supreme Court.

17. The President transmitted to Congress the reports of the Pacific Railway Commission. Mississippi: E. C. Walthall re-elected United States Senator.

19. The Senate ratified the extradition treaty with the Netherlands, and confirms the appointment of Eugene Semple to be Governor of Washington Territory.

25. Iowa: J. F. Wilson re-elected United States Senator from Iowa.

27. House of Representatives passes the Deficiency Appropriation bill as amended by the Senate (approved February 7).

February 3. Austria-Germany: Treaty of alliance officially announced.

6. Germany: Prince Bismarck explains to the Reichstag the nature of the Austro-Germanic alliance. Sweden: A new Cabinet formed, with M. Bildt as president.

8. Germany: The Reichstag passes a new military loan bill, authorizing an army of about 700,000 men and appropriating 280,000,000 marks for the purpose.

9. England: Opening of Parliament.

15. Fishery commissioners for the United States, Canada, and Great Britain sign an international treaty at Washington. The Senate passes a bill to aid in the establishment and temporary support of public schools.

17. Germany: The Reichstag continues the anti-socialist law for two years.

29. The House passes a bill authorizing the Secretary of the Treasury to apply the Treasury surplus to the purchase of United States bonds. New Jersey: County Option High License bill passed by the Assembly over the Governor's veto; Senate concurs March 6. The Senate passes a bill to provide for the compulsory education of Indian children.

March 3. The House passes the Military and Postal Telegraph bill.

4. Egypt: The British-Egyptian garrison of Suakin repulses an attack of the Arabs.

8. The Senate passes the Dependent Pensions bill.

16. Germany: Obsequies of the late Emperor at Charlottenburg.

17. France: Gen. Boulanger deprived of his command.

19. England and Wales: Local Government bill introduced in the House of Commons. The United States Supreme Court confirms the Bell Telephone patent.

22. Both houses of Congress adopt the Urgent Deficiencies bill (approved April 2).

24. Costa Rica-Nicaragua: The President of the United States announced his decision as arbitrator.

27. France: Gen. Boulanger placed on the retired list.

29. New York: The Assembly passes the Crosby High License bill.

30. Brazil: A new ministry formed, with Señor Alfredo as Premier and Minister of Finance.

31. Spain: Trial by jury approved by the Senate. Ecuador: Gen. Antonio Flores elected President (see June 10). Roumania: A new Cabinet formed, with M. Rosetti as Premier.

April 1. The Mills Tariff bill introduced in the House of Representatives.

4. France: A new ministry formed, with M. Floquet as president. Rhode Island: Royal C. Taft elected Governor.

5. The Senate passes Bond Purchase bill with amendments.

15. France: Gen. Boulanger elected to the Chamber of Deputies from the Department du Nord by more than 60,000 majority.

16. House of Representatives passes resolution to purchase United States bonds with Treasury surplus.

17. Francis Tilton Nicholls (Democrat) elected Governor of Louisiana, 85,786 majority. State election in Louisiana.

18. Bill to legalize marriage with deceased wife's sister, passed by English House of Commons. The Pope confirms the declaration of the Supreme Congregation of the Holy Roman and Universal Inquisition, condemning the use of means known as "the plan of campaign" and "boycotting" in contests between landlords and tenants in Ireland (see April 20).

19. Senate passes bill for the admission of Dakota as a State, and for the organization of Lincoln as a Territory.

25. Papal circular condemning "boycotting," etc., issued to Irish bishops (see April 18).

26. Crosby High License bill passed by New York State Senate (see May 9).

28. France: Chamber of Deputies passes Panama Lottery Loan bill (see June 5). The United States gun-boat Yorktown and the dynamite cruiser Vesuvius launched at Philadelphia.

30. Irish Land Commission bill passed by English House of Commons. Melville Weston Fuller, of Illinois, nominated by the President for Chief-Justice of the Supreme Court of the United States.

May 1. New York: General Conference of the Methodist Episcopal Church opens.

8. New York: Ballot Reform bill passed by State Assembly (see May 10).

9. New York: Bill to provide for the execution of murderers by electricity passed by the Senate.

9. New York: Crosby High License bill vetoed by Governor Hill.

10. New York: Ballot Reform bill passed by the Senate.

13. Brazil: Bill to abolish slavery approved by the Regent.

15. Conventions representing United Labor and Union Labor, met in Cincinnati, Ohio; representing Equal Rights, in Des Moines, Iowa.

17. Great Britain: Irish Catholic members formally deny the right of the Holy See to interfere in Irish politics. United States: The Senate passes Pension Appropriation bill (see June 7).

22. The Senate passes bill to establish a Department of Labor (see June 18).

23. Louisiana: Randall L. Gibson (Democrat) elected United States Senator.

24. United States: House of Representatives passes Post Office Appropriation bill (see June 14).

27. Central Asia: First train passes over the railway to Samarcand. Ireland: The National League confirm the action of their representatives in Parliament (see May 17).

30. Prohibition party: National Convention opened at Indianapolis, Ind.

31. Ballot Reform bill passed by the Legislature of Massachusetts. Canada: Lord Stanley succeeds Lord Lansdowne as Governor-General.

June 1. Philip H. Sheridan appointed General of the United States Army in accordance with a special act of Congress. The Senate confirms Robert B. Roosevelt as Minister to the Netherlands, and confirms Philip H. Sheridan as General of the Army. France: The Chamber of Deputies rejects Gen. Boulanger's motion of urgency on revising the Constitution and dissolving the Chambers. New York: Governor Hill signs the bill for executions by electricity. Oregon: Election carried by Republicans, 7,408 plurality.

5. The Democratic National Convention meets at St. Louis. France: The Senate passes the Panama Lottery Loan bill (see April 28).

6. Grover Cleveland renominated by the Democrats for President of the United States.

7. Allen G. Thurman nominated for Vice-President by the Democrats. Pension Appropriation bill approved by the President (see May 17).

10. Ecuador: Gen. Antonio Flores inaugurated as President.

11. New York: Governor Hill vetoes the Ballot Reform bill.

12. Rhode Island: Jonathan Chace elected United States Senator.

13. Bill establishing a Department of Labor approved by the President (see May 22).

14. The Senate passes Post-Office Appropriation bill (see May 24).

15. Germany: The Emperor Friedrich Wilhelm died. William II succeeds to the imperial throne.

18. Germany: Obsequies of the late Emperor Frederick III, at Potsdam.

19. Republican National Convention meets in Chicago (see June 25).

22. The House passes the Naval Appropriation bill and the Sundry Civil Appropriation bill.

24. Ireland: A papal encyclical reiterated the former decree against boycotting and the plan of campaign.

25. Benjamin Harrison, of Indiana, and Levi P. Morton, of New York, respectively nominated by the Republicans for President and Vice-President of the United States.

27. The House of Representatives passes United States Public Land bill.

July 2. The Senate passes the River and Harbor Appropriation bill. Reunion of Federal and Confederate veterans at Gettysburg—twenty-fifth anniversary of the battle.

3. Prussia: Herr Herrfurth appointed Vice-President of the Ministerial Council and Minister of the Interior.

9. Mexico: Gen. Porfirio Diaz re-elected President.

11. United States: Census bill passed by the House.

12. Diplomatic and Consular Appropriation bill signed by the President. France: The Chamber of Deputies rejects Gen. Boulanger's motion for dissolution; a vote of censure passed upon Boulanger.

13. France: A duel with swords between the Prime Minister and Gen. Boulanger, the latter wounded.

19. Africa: Major Edmund M. Barttelot, Stanley's chief lieutenant in the expedition for the relief of Emin Pasha, was murdered by natives. Italy: The Chamber of Deputies passes an Electoral Reform bill.

20. United States: The Senate confirms Melville W. Fuller to be Chief-Justice of the Supreme Court, the vote stood 41 to 20.

21. The Mills Tariff bill passes the House of Representatives, 162 to 149. The Senate passes Freedmen's Savings and Trust bill.

23. France: Gen. Boulanger defeated in an election for member of the Chamber of Deputies (see August 19.)

25. United States Senate passes Naval Appropriation bill.

26. United States Senate passes Army Appropriation bill.

27. England: The Local Government bill passed its third reading in the House of Commons.

30. Venezuela: Dr. Juan Pablo Rojas Paul assumes the presidency.

31. Italy takes formal possession of Massowah and the adjoining territory.

August 1. The Senate passes Sundry Civil Appropriation bill.

5. Gen. Philip H. Sheridan died, at Nonquit, Mass.

6. A train runs from London to Edinburgh, 400 miles, in seven hours and twenty-five minutes, including stoppages.

8. The Senate passes bill to prohibit the immigration of Chinese laborers. England: The Parnell Commission bill passed its third reading in the House of Commons.

10. Hayti: Louis Etienne Felicité Salomon abdicated the presidency, a war of factions followed.

13. Germany: Count Von Moltke placed on the retired list of the army; Gen. Van Waldersee succeeds him as Chief of Staff. United States: The River and Harbor bill became a law without the President's signature.

14. Gen. J. M. Schofield succeeds to the command of the army of the United States, *vice* Sheridan deceased.

15. The American party met in convention at Washington and nominated Gen. James L. Curtis, of New York, for President, and James L. Grier, of Tennessee, for Vice-President.

18. Prussia: Karl Heinrich von Bötticher appointed Vice-President of the Prussian Ministerial Council.

19. France: Gen. Boulanger re-elected as a member of the Chamber of Deputies.

21. United States Senate rejects the fisheries treaty by a vote of 80 to 27.

23. The President in a message asks for enlarged powers under the retaliation act.

29. Hanover: Rudolph von Bennigsen, leader of the National Liberal party, appointed Governor.

31. China refuses to ratify the treaty restricting immigration to the United States. Alabama: Thomas Seay (Democrat) re-elected Governor by about 75,000 plurality.

September 3. Arkansas: James P. Eagle (Democrat) elected Governor by 14,981 majority.

4. Vermont: W. P. Dillingham (Republican) elected Governor by 27,647 majority.

8. The House of Representatives passes the bill carrying out the President's recommendations regarding the fisheries. John L. M. Curry resigns the post of minister to Spain.

9. The President formally accepts the Democratic nomination for re-election.

10. Maine: Edwin C. Burleigh (Republican) elected Governor by 18,495 plurality.

11. Benjamin Harrison formally accepts the Republican nomination for President. The Grand Army of the Republic meets at Columbus, Ohio.

13. Chinese laborer's immigration bill approved by the President.

14. The Senate passes bill regulating the arbitration of differences between railroads.

23. China rejects the immigration treaty.

24. India: The British contingent gained a decisive victory over the Thibetans at Jalapla Pass.

October 1. The President signs the bill excluding the Chinese from the United States. Confirmations by the Senate: Lambert W. Tree, of Illinois, to be minister to Russia, and John G. Parkhurst, of Michigan, to be minister to Belgium.

6. The steel cruiser Baltimore launched at Philadelphia.

7. France: Concessions of territory announced from the King of Annam.

8. Melville W. Fuller takes the oath as Chief-Justice of the Supreme Court.

9. The Senate: John H. Oberly, of Illinois, confirmed as Commissioner of Indian Affairs. Chicago: Strike of 2,000 car-drivers. Congress passes supplementary legislation as to counting the presidential vote.

12. Germany-Italy: Emperor William visits Rome.

15. France: The Chamber of Deputies reassembles, and M. Floquet introduces his bill to revise the Constitution.

17. Hayti: Gen. Francois Dennis Legitime elected President. Subsequently his election was disputed, and a war of factions followed, lasting until after the end of the year.

20. New York city: Fifteenth annual meeting of the National Women's Temperance Union. Daniel Hand, of Clinton, Conn., gives the American Missionary Association \$1,000,000 for the education of Southern negroes. The General Deficiency bill approved by the President. Congress adjourns after the longest continuous session on record.

22. The Supreme Court affirms the constitutionality of the law against liquor-selling in Iowa, and of an Alabama law prescribing tests for color-blindness among railroad employes.

23. Scotland: The Parnell libel case against the "London Times," opens at Edinburgh.

27. Hayti: The American steamer Haytien Republic, seized by the local authorities for alleged blockade-running.

30. Lord Sackville-West, the British minister resident at Washington, officially notified that he is no

longer acceptable as a diplomatic representative, on the ground that he had criticised the action of the United States Government.

November 6. Benjamin Harrison, the Republican candidate, elected President.

9. Africa: The Mahdi with a large army is reported to have attacked and captured the town of Wadai.

10. Europe: An agreement is announced among the great powers to exterminate the African slave trade.

13. The Knights of Labor open their eleventh annual meeting at Indianapolis.

14. Brooklyn, N. Y.: Strike of car-drivers, three city lines "tied up" (strike ends November 16).

19. The Empress-Dowager of Germany (widow of Frederick), visits England. American steamer Haytien Republic confiscated at Port-au-Prince, despite the protest of the American minister.

23. Knights of Labor re-elect Mr. Powderly as grand master workman.

24. The United States steamship Boston reaches New York from Port-au-Prince, with yellow fever on board. Several deaths, including the surgeon, occur.

27. Florida: For the first time in 112 days there are no new cases of yellow fever and no deaths in Jacksonville.

29. England: The Ashebourne Extension bill passes the House of Commons.

December 2. France: Great popular demonstration in Paris in honor of Baudin.

3. The Fiftieth Congress begins its second session.

6. The American Forestry Congress meets in Atlanta, Ga.

7. Maryland: A formidable resistance to legal authority begins among the oyster-dredgers of Chesapeake Bay.

8. Alabama: Serious lynching riot, and loss of life at Birmingham.

11. The First National Sabbath Convention meets at Washington.

12. United States steamers Galena and Yantic sail for Hayti to demand the release of an American passenger steamer. The House of Representatives passes the Direct Tax bill, 173 to 96.

13. Africa: Dispatches reach the coast declaring that Stanley and Emin Pasha are prisoners to the Mahdi.

14. France: A bill introduced in the Chamber of Deputies giving the Panama Canal Company more time to fill its contract. South Carolina: The State Assembly favorably reports an educational qualification for voters.

17. Mississippi: Conflict between whites and negroes at Wahalak.

18. New York city: A new wing of the Metropolitan Museum of Art is opened with imposing ceremonies.

20. Congress adjourns till Jan. 2, 1889. Egypt: Engagement between the British and Egyptian garrison of Suakin, and a besieging force of Arabs, the latter defeated with heavy loss.

21. Africa: Dispatches to date of August 17 agree that Stanley and Emin Bey are safe and at liberty. United States: Both houses of Congress adjourn for the holidays.

23. Hayti: The confiscated American steamer Haytien Republic surrendered to the United States vessels sent to Port-au-Prince to secure her release.

24. Great Britain: Parliament adjourns till Jan. 31, 1889.

F

FINANCIAL REVIEW OF 1888. This year was a remarkable one in very many respects. Two Emperors of Germany died within an interval of but little more than three months; yet these events and the succession of the youthful Emperor William III resulted in no political friction and in no financial disturbance. At all the great European monetary centers there was a demand for gold with which to supply the requirements of the Argentine Republic and of Russia, but with such care was this conducted that no legitimate business interests directly suffered. At home there was an unusually excited presidential canvass which resulted in a radical change in the administration; yet while the campaign was most hotly conducted there was no interruption to business, and although the question of the tariff was directly involved, manufacturing of goods likely to be affected was only partially checked. A fall in the market value of silver to the lowest price on record did not arouse apprehensions in the public mind concerning the stability of our currency, although the vaults of the Treasury were full to overflowing of the coined dollars, and the only effect produced by the decline in silver was temporarily to limit the output at the mines. While gold was at intervals exported to Europe none went forward as an exchange operation, the shipments being wholly made on special order. Speculators manipulated the cotton market in August and forced the price so high that the staple was imported from Liverpool at a profit, and, in October wheat was advanced to figures which, could the grain have been obtained abroad, would have justified its importation. The country had a fairly good crop of winter wheat and there was a partial failure of spring sowed grain, the former maturing under very favorable conditions, while the latter was blighted by unprecedentedly early frosts, yet the corn-crop escaped injury. Early in the spring the East was visited by the most severe storm of snow experienced in many years, while at the same time mild weather prevailed in the extreme Northwest, and when the wheat in that section was being blasted by frost the temperature was genial at all other points in the country. While the great transportation lines were so crowded with business that the rolling stock was insufficient for the traffic a war of rates was inaugurated by one of the most conservatively managed roads in the East, resulting not only in demoralization of tariffs but in unsettling confidence in the market value of our stocks at home and abroad. Executive officers of railroad corporations, responsible for millions of share and bond property, permitted their subordinates to aid in depreciating its value by frequently and persistently cutting

passenger and freight rates, and mismanagement of these roads finally became so atrocious that bankers representing large interests here and abroad were called upon to interfere and demand a reformation. The country was generally prosperous; farmers received good prices for their crops; manufacturers realized fair profits while labor was suitably rewarded; merchants in almost every section had reason to be satisfied with the results of the year's business, and losses through failures in trade were comparatively limited. But while the industrial and mercantile classes enjoyed a good degree of prosperity many of those who depend upon the proceeds of investments for support were harassed by the fear of loss if they did not actually suffer from reduction of revenue caused by smaller dividends from share properties.

At the opening of the year the Bank of England had a stock of £20,164,214 bullion, 38 per cent. of reserve to liabilities, and a 4 per cent. minimum rate of discount. The highest stock of bullion during the year was £28,460,624, March 21, and then the proportion of reserve was 44½, and the bank-rate 2 per cent. By December 6 the bullion had been drawn down to £18,808,478, the bank minimum had ruled at 5 per cent. since October 3, although for several weeks the open market discount rate was only 2½ per cent., and the bank had advanced the price of gold bars to the highest figures, 77 shillings 10½ pence, in order to check withdrawals of bullion for export. When the year opened the Bank of France had £44,088,104 gold. The highest for the year was £45,438,652, and the lowest £40,663,482, November 29. On January 7 the estimated amount of gold in the Bank of Germany was £25,986,000. The greatest sum was £33,782,000, June 23, but by the beginning of November this had dwindled to £28,568,000. Comparing the highest and the lowest amounts of bullion in each of the three banks, it is seen that there was a loss of £5,157,151 by the Bank of England, £4,775,220 by that of France, and £5,169,000 by that of Germany. The shipments from this country to Great Britain were about £2,250,000, and to Germany £2,900,000, and all this gold was drawn for indirect shipment to South America. The bankers in London and Berlin who had contracted to supply the Argentine Republic kept the open markets of the principal European centers bare of gold during the greater part of the year, but how much was thus obtained it is impossible to say. The movement to South America was doubtless nearly equal to three fourths the aggregate of all the withdrawals from the European banks and from New York, or not far from £14,000,000, the remainder going to Russia, which took £5,000,000, and Holland, £1,000,000. The Ar-

gentine loan, negotiated early in the year in England and Germany was for the purpose of enabling the free banking system of that country to be carried into effect. This law provided for the issue of notes of banks against a 4½-per-cent. Government stock for which payment could be made only in gold, which metal was required to be lodged in the National Bank until January 1, 1890, after which it might be used by the Government for the redemption of a portion of the foreign debt. After the drain of gold from London and other European centers had become so great as to absorb the open market supply, a resort was had to the banks for further amounts, and then it was that the official discount rates began to be disturbed. Almost simultaneously, early in October, the rates at the Banks of England and France were advanced, the former to 5 and the latter to 4½ per cent., and at the same time there was an unexpected shipment of £500,000 in Bank of England notes to Russia, supposed to be for the purpose of holding in lieu of gold against a new issue of rubles. The condition of the European markets became so strained by reason of this movement to South America and to Russia, that the bankers negotiating with the Argentine Republic notified that Government that further shipments thither would endanger the success of the loan, and thereupon the banking law was amended so as to permit the gold held by the National Bank to be released. This temporarily relieved the pressure, and the gold thereafter sent to South America was ordered out from New York by London and German bankers. Toward the end of November a London and Paris syndicate negotiated a £20,000,000 conversion loan for the Russian Government, and this tended to keep the rates for money high at all the European centers for the remainder of the year.

Among the important events of the year was the successive defeat of various labor organizations. The determined stand taken by the Philadelphia and Reading managers in January resulted in the abandonment by the Knights of Labor in the mining regions of all efforts to dictate the policy of the company, and this also caused the ending of the miners' strike in the Lehigh valley region. The next movement of importance was that of the engineers on the

were more clearly manifested this year, and at the annual convention in November the official report showed a decrease of 800,000 in membership during the year, and only 259,518 on the rolls. The losses were heaviest in the Eastern States and in the large cities. The treasurer's report showed that the receipts were not sufficient to meet the expenses, and retrenchment became necessary.

The silver question was rarely discussed during the year. The United States Treasurer and the Secretary of the Treasury both suggested to Congress the advisability of suspending coinage of the standard dollar and the keeping of the purchases of silver bullion in the form of ingots, but no action was taken by Congress on the suggestion. The order of the Secretary of the Treasury directing that checks, drawn against deposits of gold by the banks in the Sub-Treasury, be received for duties at the New York Custom-House went into effect July 1, and it not only proved of great convenience to the mercantile public, but it tended to lessen the demand for currency, including silver certificates.

The following tabular survey of the economical conditions and results of 1888 contrasted with these of the preceding year is from the "Commercial and Financial Chronicle":

ECONOMICAL CONDITIONS AND RESULTS.	1887.	1888.
Coin and currency in the United States, November 1.....	\$1,678,099,959	\$1,694,771,688
Bank clearings in the United States.....	51,050,705,385	49,097,528,591
Business failures.....	167,580,944	128,839,978
Imports of merchandise.....	708,818,473	725,394,153
Exports of merchandise.....	715,801,044	691,766,469
Gross earnings, 108 railroads.....	374,569,865	366,636,292
Railroad construction, miles.....	13,080	7,000
Wheat raised, bushels.....	456,839,000	414,868,000
Corn raised, bushels.....	1,454,161,000	1,967,790,000
Cotton raised, bales.....	7,017,707	6,900,000
Pig-iron produced, gross tons.....	6,417,148	6,499,729
Steel rails, Bessemer, net tons.....	2,290,197	1,528,057
Anthracite coal, gross tons.....	84,641,017	83,145,718
Petroleum (runs), production, barrels.....	21,819,027	18,095,448
Immigration into the United States.....	510,068	518,515

The prices of leading staples on or about Jan. 1, 1889, compared with prices at the same date in 1888 and 1887, were as follows:

PRICES OF LEADING STAPLES.	1887.	1888.	1889.
Cotton, middling uplands, per pound.....	9½	10½	9½
Wool, American XX, per pound.....	89	87	88
Iron, American pig No. 1, per ton.....	\$20 00 to \$21 00	\$21 00 to \$21 50	\$18 00 to \$18 50
Steel rails at mills, per ton.....	\$36 00 to \$37 00	\$32 00 to \$33 00	\$28 00
Wheat, No. 2 red winter, per bushel.....	92½	92	\$1 01½
Corn, Western mixed No. 2, per bushel.....	48½	68	46
Pork, mess, per barrel.....	\$12 25 to \$12 75	\$15 50 to \$16 00	\$14 00 to \$14 25

Chicago, Burlington and Quincy. The defeat of the Brotherhood of Locomotive Engineers was a severe blow to the organization, and one from which it did not recover. The indications of disintegration of the order of Knights of Labor which were visible at the close of last year

Manufacturing Industries.—With the exception of the strike of the miners in the Schuylkill and Lehigh valley coal regions, early in 1888, and some smaller troubles of this character in other branches of business, at intervals during the year, producers and manufacturers were

comparatively undisturbed by the demands of labor organizations. The fact was early recognized that Congress would make an attempt to revise the tariff, and the uncertainty which existed regarding the final action of that body upon this subject induced manufacturers of articles likely to be affected by changes in the tariff to restrict their operations and to confine the production so far as was possible to current needs. It was not until after the presidential election that there was any important activity in manufacturing of goods, and then only in woollens. The production of cottons was large and the mills generally did a profitable business. The output of pig-iron was about 6 per cent. below the large production of 1887, and the decrease was most marked in Bessemer pig. The manufacture of structural iron and steel, however, was greater than in 1887 or in 1886. The product of the Tennessee and Alabama iron-manufacturing districts was a striking feature, as also was the new process of the petroleum jet blast for the manufacture of iron and steel, which, it was claimed, would greatly reduce the cost of production. The output of anthracite coal was the largest on record, and schedule prices were generally well maintained until December, when decreased consumption and an accumulation of stocks caused a slight reduction.

The Money Market.—Money on call, represented by bankers' balances, ranged from 10 to 1 per cent. during the year. The 6 and 7 per cent. rates were in January, on March 2, and on October 3, due, on the last named day, to large withdrawals for the West and also by the customary demand for settlements. In the last two weeks of December, 8 per cent. was recorded, and on the last day of the year money loaned at 10 per cent., but then the demand came from belated borrowers in the absence of representatives of lenders. Scarcely anything was done in time-loans in stock collateral until toward the close of January when there were a few transactions at $4\frac{1}{2}$ per cent. for six months and 4 for sixty days. Rates grew easier early in February and contracts were made at 3 per cent. for sixty days to four months, and 4 for six months, but toward the close of February rates were firmer at 4 to 5 per cent. for ninety days to four months and 5 to $5\frac{1}{2}$ for six months, the expectation then being that bank reserves would be materially reduced by Treasury operations. These rates ruled quite uniformly throughout March, becoming slightly easier toward the close, but early in April, under the influence of offerings of foreign money on call and on time, rates fell to 3 to $3\frac{1}{2}$ per cent. for sixty days to four months and $4\frac{1}{2}$ to 5 for six months to the end of the year. After the Secretary of the Treasury commenced to buy bonds, thus insuring ease in money, the offerings were liberal but the demand was not urgent, borrowers being satisfied that they could procure all needed accom-

modation in the call-loan branch of the market, where the rate gradually fell to an average of 2 per cent. In May the exports of gold encouraged lenders to hope that they could do better later in the season than by offering money at the then low rates, and many of them withheld their offerings on time and employed their funds in the call-loan market, but the demand was comparatively insignificant and the smaller supply had no effect upon rates. Early in June time-loans were quoted at $2\frac{1}{2}$ per cent. for ninety days, 3 for four months, and $3\frac{1}{2}$ for the remainder of the year, and toward the middle of the month the rate was 2 per cent. for sixty days. In July some foreign money was placed for about four months' time at $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. on strictly prime collateral, and this forced domestic lenders out of the market temporarily. By the close of the month, however, quotations were $2\frac{1}{2}$ to 3 per cent. for sixty days, 3 for ninety days; $3\frac{1}{2}$ for four months, and 4 to $4\frac{1}{2}$ for four to six months. Early in August there was a slight advance in the call-loan rate, due to withdrawals of funds for the West, but before the close quotations fell off again, influenced by the light inquiry for time-loans which caused lenders to employ their money on call. Then quotations were $2\frac{1}{2}$ to 3 per cent. for sixty to ninety days; 3 to $3\frac{1}{2}$ for ninety days to four months; and $3\frac{1}{2}$ to $4\frac{1}{2}$ for four to six months. By the middle of September rates were 5 per cent. for four, five, and six months, but very little was done and there was then an impression that rates would become still easier by reason of a return of funds from the West. During the first few days in October call-loans advanced to 7 per cent., partly in consequence of withdrawals for the monthly settlements, but mainly because of a drain of money to the West, it being attracted thither by the wild speculation in wheat. Time-loans were then quoted at $4\frac{1}{2}$ to 5 per cent. for four, five, and six months, but they were not in demand, and toward the close of the month, under the influence of offerings by bankers with foreign connections, the rate fell to 3 to $3\frac{1}{2}$ per cent. for the remainder of the year and 4 to 5 for four, five, and six months. Call money had by this time gradually declined to an average of 2 per cent. Early in November many of the banks and trust companies, finding time-loans unremunerative and commercial paper scarce, bought freely of railroad mortgages taking anything that would yield above 4 per cent., but later in the month there was a good inquiry from almost every quarter for time-loans, based upon the expectation of an active demand for money for manufacturing and business enterprises, and rates moved up to $3\frac{1}{2}$ per cent. for sixty days; 4 for ninety days to four months; and $4\frac{1}{2}$ to 5 for four to six months. Call money ranged from 4 to 2 per cent. In December lending on time was practically confined to a few of the city trust companies and to out-of-town institutions and the de-

mand was not very urgent until toward the close when there was a good inquiry for loans for sixty days at 4 per cent. Rates early in the month were 3 to 3½ per cent for sixty days, 3½ to 4 for sixty days to four months, and 4½ to 5 for four to six months. After the middle of the month bank reserves fell off, three of the largest city institutions held nearly the whole of the surplus reported by all the banks, call-money ruled at an average of about 5 per cent., and the supply came chiefly from bankers having balances and a few trust companies.

Early in the year mercantile paper was in abundant supply. Rates were 5 to 5½ per cent. for sixty to ninety day indorsed bills receivable in the beginning of January, gradually falling, under the influence of a better demand, to 4½ to 5 by the end of the month. In February the range was from 4½ to 5, and in March paper sold less freely with rates up to 5 to 5½ per cent. by the close. In April the supply was small, but the demand was good, and rates were 4½ to 5½ per cent. In May quotations fell off to 4 to 4½, and in June, influenced by more urgency in the inquiry, rates declined to 3½ to 4 per cent., recovering in the next month to 4 to 4½, and in August to 4½ to 5. In September paper was abundant, but none of the banks were buying, and consequently rates advanced to 5½ to 6; but in October the demand improved, and quotations fell to 4½ to 5, dropping the next month to 4 per cent. In December the inquiry grew light toward the close, and the quotation was 5½ per cent.

It will be seen by the above that at no time during the year was there any real scarcity of money, and borrowers on call, on time, and on commercial paper found a comparatively liberal supply offering. The New York associated banks held at the beginning of the year \$108,653,200 gold and legal-tender notes, consisting of \$75,235,400 of the former and \$38,417,800 of the latter. By the end of March the gold had been reduced to \$71,851,800, but under the influence of bond purchases and other accumulations from Treasury operations, this item was carried to \$98,694,200 by July 14, and then, by reason of the demand for the interior for crop purposes, it fell to \$78,862,400 by September 8, rising to \$94,281,800, the maximum of the year, by October 20, showing the effect of large bond purchases and the return movement from the interior. The legal-tender maximum for the year was recorded August 4. Then the drain to the West and South caused a decline to the minimum of \$26,700,900 by November 10. Deposits

were \$371,805,900, the minimum of the year, January 7, and the maximum, \$421,884,800, was reached October 20, meanwhile falling from \$418,234,000, July 14, to \$406,309,100, September 22. Loans and discounts were at the minimum, \$354,767,900, January 21, and at the maximum, \$397,243,200, October 13. The surplus reserve was \$10,826,725 at the opening of the year, rising to \$23,258,825 by January 28, falling to \$8,620,875 April 7, recovering to \$28,468,700, the maximum, July 16, declining to \$10,814,550 October 13, sharply reacting to \$16,901,025 October 20, and then gradually falling to \$6,281,850 December 29.

The Secretary of the Treasury, with a view to the relief of the money market, and in order to distribute the Treasury holdings of cash, decided early in the year further to increase the number of designated depositories, and, in pursuance of this policy, the amount of money on deposit with national banks throughout the country was increased from \$52,109,918, January 1, to \$61,921,294 by May 1. Then followed a gradual reduction to \$59,091,289 by September 1, and afterward, in consequence of the surrender of bonds for the security of deposits, the amount was reduced to \$51,925,078, December 1, and at the end of the year the public money held by the designated depositories was \$52,890,154. Under the authority of the act of October, 1882, reaffirmed April 17, the Secretary of the Treasury on April 28 commenced purchasing 4 and 4½ per cent. United States bonds, continuing to do so to the end of the year, with the exception that on October 10, after taking \$51,394,200, purchases of the 4-per-cents. were suspended, and thereafter buying was confined to the 4½s. The bond-purchases at the end of the year amounted to \$101,715,500, and the sum paid therefor, including premiums, was \$120,254,940. The bonds came chiefly from New York and vicinity, and payments for the same were made through the banks in this section of the country, thus largely accounting for the increase of cash and of reserves in our banks. But to the extent that these bonds were held by the Treasury as security for circulation, the amount distributed to the banks was only 10 per cent. of the par value and the premiums. The high price which the bonds commanded in the market by reason of the Treasury purchases induced liberal surrenders of circulation after the beginning of September, but these were confined by law to \$3,000,000 per month.

Appended is the New York Clearing-House statement of totals at the beginning of each quarter of 1888 and at the end of the year:

DATE.	Loans.	Specie.	Circulation.	Deposits.	Legal tender.
JANUARY 7.....	\$360,070,500	\$75,235,400	\$3,062,900	\$371,805,900	\$38,417,800
March 31.....	388,582,000	71,851,800	7,602,700	373,518,900	21,194,000
June 30.....	377,065,900	90,707,100	7,627,500	408,580,700	28,192,800
September 22.....	390,707,900	85,524,400	4,582,000	408,714,900	21,819,600
December 29.....	388,798,700	76,521,300	4,862,300	400,514,800	22,383,700

The condition of the New York Clearing-House banks, the rates for money, exchange, and silver, and prices for United States bonds on or about Jan. 1, 1889, compared with the preceding two years, are shown in the following summary:

BANK RETURNS, ETC.	1887.	1888.	1889.
NEW YORK CITY BANKS:			
Loans and discounts.....	\$348,687,500	\$356,540,000	\$388,798,700
Specie.....	82,118,100	71,189,800	78,527,300
Circulation.....	7,911,500	8,077,300	4,862,300
Net deposits.....	859,268,600	859,859,900	400,214,600
Legal tenders.....	19,870,400	27,259,900	29,586,700
Required reserve.....	89,817,150	89,589,950	100,078,650
Reserve held.....	102,068,500	98,899,100	106,260,000
Surplus reserve.....	\$12,271,350	\$8,559,150	\$6,261,350
MONEY, EXCHANGE, SILVER:

4s of 1897, coupon.....	127½	126½	126½

Foreign Exchange.—The imports of merchandise for 1888 were \$16,405,675 above those for 1887, and the exports of domestic and foreign merchandise for the same time were \$23,534,582 less. The excess of merchandise imports over exports for the year was \$33,457,691, against \$6,482,566 exports over imports in 1887. There was an excess of \$37,199,619 exports over imports of specie and bullion in 1888, against \$24,872,499 imports over exports in 1887. The excess of exports over imports of merchandise and specie in 1888 was \$3,741,928, against \$18,389,933 imports over exports in 1887.

Foreign exchange was strong early in January in consequence of a scarcity of commercial bills, and the low rates for discounts in London encouraged purchases of long sterling. Toward the middle of the month offerings of maturing drafts and a reduction in the Bank of England minimum to three per cent. from four caused a decline in sight bills, and the tone of the market was heavy at the close of the month. At the beginning of February there was a fall of one cent per pound sterling, mainly due to the offerings of bills against new securities placed abroad, and it was estimated that over \$30,000,000 railroad bonds had been so disposed of since the commencement of the year, money in Europe being cheap—1½ to 1½ in London for sixty days' to three months' bank bills, 2½ to 2½ in the open market at Paris, and 1½ to 1½ at Berlin. By the middle of the month, however, the tone grew firmer in consequence of a scarcity of bills, although there was a reduction in the Bank of England minimum to 2½ per cent., and in the rate of the Bank of France to the same figure. Toward the end of the month and early in March there was a further advance in sterling, due to a limited supply of commercial bills and to a demand to remit for stocks sold for European account, confidence abroad in American securities being unsettled by the strike on the Chicago, Burlington and Quincy,

and by the unfavorable traffic returns of the Erie and of the Reading. About the middle of March the Bank of England minimum was reduced to 2 per cent., but this had no particular effect upon exchange, which became easier, mainly because of offerings of bills drawn against purchases of stocks for European account. The first shipment of gold, \$800,000, was made March 29, but this went out on special order, and not as the result of an exchange operation. Early in April the rates fell off because of continued offerings of bankers' bills, although commercial sterling continued scarce, but before the close of the month there was an upward reaction, partly due to dearer money in London, which early in May caused an advance in the Bank of England minimum to 3 per cent. There were other shipments of gold May 9, May 12, and during the week ending May 26, but these were also sent on special order, and indirectly to the Argentine Republic, London bankers then being engaged in supplying demands for that country, which gradually grew urgent. At no time during the month were the rates of sterling high enough to justify gold exports as an exchange operation. The Bank of England reduced its minimum rate to 2½ per cent. June 6. The bills drawn against the negotiation of the Baltimore and Ohio, the Reading, and a Canadian loan gradually came upon the market in June, but additional shipments of gold were made, also on special order. The rates fell off in July, but gold continued to go forward in response to an apparent determination by the managers of the Imperial Bank of Germany still further to augment its supplies of the metal. Toward the close of the month exports of grain were liberal, and these furnished a better supply of commercial bills, and there were also offerings of drafts in anticipation of the movement of cotton. The pressure of this exchange caused a further decline in rates early in August, but the tone soon grew firmer under the influence of dearer

money in London and an advance in the Bank of England minimum to 3 per cent. On the 9th the corner in August deliveries of cotton not only stopped the export of that staple but it caused the import of cotton from Liverpool, to the value of about \$500,000, thus affecting commercial bills. In September the market was in an anomalous condition. Rates were near the gold exporting point, because commercial bills were small in volume, the supply being limited in consequence of the scarcity of freight-room which prevented free shipments of staples. Discounts were so high in London that bankers did not care to anticipate a decline in the exchange market by making speculative sales. Sterling was directly affected on the 13th by an advance in the Bank of England minimum to 4 per cent., and a rise in the Bank of France to 3½. Toward the end of the month rates were very firm, and on October 4 the Bank of England minimum was further advanced to 5 per cent., the Bank of France to 4½, and that of Germany to 4, forcing a rise in sight sterling very near to the gold exporting point, and on the 9th \$500,000 was sent to London on special order. The speculation in wheat stopped exports, and the cotton movement was late, so that the supply of commercial bills was insignificant. About the middle of the month sterling fell off on a better offering of bankers' bills and a lighter demand, and by the close the tone was decidedly easier, there then being a greater supply of cotton drafts and cheaper money in London, due to the temporary suspension of gold exports to South America. In November commercial and bankers' bills were scarce, there was a demand to cover speculative sales, and rates were firm throughout the month. Toward the close about \$5,000,000 gold went to London and Germany, wholly on special order. In December the tone of the market was firm for short bills and easy for long, in consequence of dearer discounts in London, and during the second week some bankers advanced short drafts to a price very near the gold exporting point, but no gold was sent as an exchange operation, although about \$3,000,000 went to Germany and \$2,000,000 to London on special order. In the third week the exchange market was quiet and firm, and \$1,000,000 gold went to Berlin. For the remainder of the month the tone was barely steady, but without any alteration in nominal rates. None of the gold sent abroad this year—\$11,253,962 to London and \$14,514,467 to Berlin—went forward as an exchange operation. The metal was first attracted to Great Britain by a desire on the part of the bankers—who were under engagement to supply the Argentine Republic—to avoid disturbing the London money market by drawing from the Bank of England. On October 9 the news of the shipment hence of \$500,000 tended immediately to ease the open market discount rate in London. The exports to that center in November and De-

cember were made because the bankers above referred to, being parties to the negotiation of the Russian conversion loan of £20,000,000, were willing to pay a premium for bar-gold amounting to about one half to one quarter of a penny per ounce below the price demanded by the Bank of England. The movement to Germany in the summer was, as stated above, due to efforts of the Imperial Bank to augment its stock of this metal, and, having obtained a supply, the bank sought to retain it by advancing its rate of discount, and December 6 this rate moved up to 4½ per cent., thus aiding in attracting further amounts from London and New York.

Railroads.—The majority of managers of railroads of the country claimed, in those of the annual reports which at the end of the year were made public, that their properties had felt the effect of the fourth and fifth sections of the Interstate Commerce Act, and particularly of the latter, which prohibits pooling, more severely than they did during that portion of the previous year in which the act was in operation, for the reason that the competition from new lines was great, and also because agreements for the maintenance of rates were not generally regarded. The Eastern trunk lines suffered to some extent from the aggressive course pursued by the Canadian roads, but the old established routes felt the influence of competition by more recently established trunk lines and their connections, to which differentials had to be given, and these rates were by no means uniformly maintained. In the Northwest the old roads were called upon to meet the competition of newly organized lines which waged a guerilla warfare to get business, and succeeded in keeping rates in an unsettled state throughout nearly the whole of the year. In the Southwest rates were forced to low points by excessive competition and the aggressive course of the Missouri Pacific, and the result was reductions of dividends to points never before reached in the history of the roads. Southern lines enjoyed a greater degree of prosperity by reason of an increase of traffic and comparative immunity from competition, but some of the Eastern roads suffered severely during the year, although mainly from local influences. One feature was the action of the Iowa railroad commissioners in formulating a new distance tariff of rates for roads in that State far below those previously ruling. This action was resisted by the companies, and on application to Judge Brewer, of the United States Supreme Court, an injunction was granted, July 26, restraining the commissioners from enforcing the new tariff, the judge taking the ground that rates must be reasonable and just, and sufficiently high to enable the roads to meet expenses and fixed charges and leave something for the stockholders. The manner in which the railroad commissioners prepared their tariff was made the subject of a judicial investigation by State

Judge Fairall, and irregularities were disclosed sufficient to induce him also to enjoin the execution of the tariff. These decisions served to influence the commissioners of other Western States to be more conservative in their action, and complaints of injustice were confined to the Iowa commissioners. The course taken by the directors of the Chicago, Milwaukee and St. Paul in passing the dividend on the common stock and reducing it on the preferred September 12, aroused the European stockholders of the company to that extent that they almost unanimously agreed to deposit their holdings with a prominent London banking-house with a view to securing united action for self-protection against what they regarded as reckless management on the part of the directors. Subsequently, October 18, the Atchison, Topeka and Santa Fé managers themselves invited the co-operation of an American banking-house with European connections with a view to giving assurance to stock and other security holders that the financial affairs of the company would be conservatively administered. During November a plan was made public for the organization of a railroad clearing-house, intended primarily to embrace only the South-western roads. But the scheme was afterward made to include all lines running northwest, west, and southwest of Chicago and St. Louis. In the shape in which it was presented it provoked the opposition of some of the Granger roads, and this led to important modifications. The consideration of the plan was subsequently deferred, and early in December, in response to a general demand for the adoption of some measures which would result in ending the rate wars and in restoring and maintaining tariffs, conferences were held in Chicago by some of the Western railroad managers, which were attended by Commissioners Cooley and Morrison of the Interstate Commission, and the fact was then disclosed that the unsettled condition of the passenger business resulted mainly from the issue of tickets to brokers who were al-

come aroused to such an extent that a demand was made for radical reforms in railroad management. During the third week in December there was a conference in New York between the presidents of the leading Western roads and bankers with European connections, which resulted in an agreement being made to restore and maintain rates, and to limit the authority of subordinates to change the tariff. Petitions were in circulation at the close of the year for the modification of the Interstate Act, but the commissioners were understood to be opposed to any essential change in the law, and it was regarded as probable that nothing would be done at that session of Congress. The South Carolina Legislature amended the State law so as to restore the power of the railroad commission to regulate rates of freight and passenger transportation. Among the prominent events of the year were the placing of the Missouri, Kansas and Texas in the hands of receivers; the completion of the reorganization of the Philadelphia and Reading, the Texas and Pacific, and the Chesapeake and Ohio; the financial embarrassments of the Atchison, Topeka and Santa Fé, resulting from the Chicago extension and the railroad war in the Southwest; the purchase by Mr. Gould of a control of the St. Louis, Arkansas and Texas; the placing of the Minneapolis and St. Louis in the hands of a receiver; the changes in the management of the Baltimore and Ohio; and the lease by the Louisville, New Albany and Chicago of the Louisville Southern, giving it connection with Chattanooga and the South. Railroad construction was active early in the year, and the new mileage for 1888 was about 7,000 miles, which, at \$20,000 per mile for road and equipment, would call for an outlay of about \$140,000,000. The following shows gross and net earnings of the principal trunk roads, the reports, except for the Pennsylvania, being made for fiscal years, and the returns of the New York Central including the operation of the West Shore leased line:

ROADS.	1882-'83.	1883-'84.	1884-'85.	1885-'86.	1886-'87.	1887-'88.
PENNSYLVANIA:						
Gross earnings.....	\$51,069,259	\$48,566,918	\$48,615,084	\$50,879,077	\$55,671,313	\$58,172,068
Net earnings.....	19,334,109	18,089,902	16,185,969	17,759,438	18,584,728	18,940,936

lowed an excessive commission, which course was decided, by Messrs. Cooley and Morrison, to be in violation of law. Revelations of the methods pursued by some railroad officials for the purpose of evading the Interstate Act called forth the expression by the commissioners of a determination to punish such violations of the law as could be proved, and public feeling be-

The Crops.—The wheat-crop for the season of 1888, as reported by the Department of Agriculture, was 414,868,000 bushels, while that of corn was 1,987,790,000, or about the largest on record. Good authorities claim that the cotton crop will be not far from 6,900,000 bales. Conditions for winter wheat were unfavorable throughout the entire season, and the

average was uniformly low, but the harvest was better than was expected, the average yield being about twelve bushels to the acre. Spring sowed wheat started in good condition, and the highest average was in July. During the following month there was a material reduction, and in September there came frosts in the extreme Northwest which caused irreparable damage in some sections, the extent of which was not fully revealed until after the harvest. Corn planting was delayed in the northern portion of the belt by reason of low temperature, but favoring suns and rain aided in a rapid development of the plant, and the condition was high during the entire season with the exception of Kansas where hot winds and local droughts did some damage. The crop was gathered under very favorable circumstances, and the bulk of it was out of the way of frost before the advent of freezing temperature. The oat crop was unprecedented, being estimated at about 707,787,000 bushels, that of barley at 50,000,000, and that of rye at 25,000,000 bushels. Cotton was late in coming to maturity by reason of heavy rains during September. The indications early in the season pointed to deficient crops of wheat in all the importing countries of Europe, and this news stimulated a prompt movement of the grain to market, and our farmers generally obtained good prices for their product. Toward the close of September speculative manipulation, based upon evidence of a shortage in the crop of spring sowed grain carried the price to two dollars for the options of that month and correspondingly affected the price for later deliveries. This checked exports and caused a sharp advance in the price of flour. Of the 3,568,650 bushels of wheat exported during October only 303,800 went from the Atlantic ports, the remainder being shipped from San Francisco and other Pacific ports from whence the exports for the corresponding month in 1887, were only 668,654 bushels. Of the 2,733,694 bushels of wheat exported in November, 2,382,522 were shipped from the Pacific coast. For six months ending December 31, exports of wheat were 28,220,770 bushels, of which 17,584,316 went from California and Oregon, against 44,679,666, of which 10,340,417 from the Pacific ports, for the same time in 1887. Wheat-flour exports for six months this year were 4,843,790 barrels against 6,235,926 for the corresponding period in 1887.

Taking the prices in the New York market on or about January 1 in each year and the total yield for the previous season, we have the following approximate results:

THE CROPS.	Yield.	Price.	Value.
1887.			
Wheat, bushels.....	456,829,000	\$0 92	\$419,822,680
Corn, bushels.....	1,456,161,000	68	917,281,480
Cotton, bales.....	7,017,707	10 2½	359,763,907
1888.			
Wheat, bushels.....	414,868,000	1 01½	421,091,020
Corn, bushels.....	1,987,790,000	46	914,888,400
Cotton, bales.....	6,900,000	9½	380,006,250

The Stock-Market for 1888.—During the whole of April and July, the greater part of January, June, August, and September, and the latter portion of December, the stock-market was strong, while in March, May, November, and October it was weak, and in February the tendency was generally downward. The declines were at intervals arrested and the current of prices changed by favorable news, manipulation of specialties, and the temporary removal of causes of depression. The cutting of rates by Western, Northwestern, and Southwestern roads continued almost without interruption from the beginning to the end of the year, and the lower revenues resulting therefrom compelled a reduction of dividends to such an extent that, in one case—that of the St. Paul—the European stockholders were induced to unite for self-protection, and in December prominent banking-houses, who represented large investment interests here and abroad, felt called upon to interfere and insist upon the ending of the disastrous rate-war. Through their influence a pledge to restore tariffs was obtained, and the railroad situation improved toward the close of the year. While the principal transportation lines were unfavorably influenced by rate-wars, the stocks of the coal companies reflected the harmonious management of this important interest, and the market-values of these properties almost uniformly improved. There was a more confident feeling at the opening of January regarding the immediate future. This was based upon the expectation of continued ease in money and upon the conviction that the public would soon come into the market, first as purchasers of bonds and then of stocks. There was a good demand from investors at home and abroad for railroad mortgages during the greater part of the month, but it was not until the third week that the inquiry for stocks grew important. Then the market became active, and it continued strong to the close. Reading was unfavorably influenced early in the month by the strike of miners in the Schuylkill region of Pennsylvania, these men demanding an advance in wages and insisting upon the reinstatement of train employes who had been discharged for cause. This strike resulted in a virtual suspension of mining by the Reading during the entire month, but the other coal companies were not unfavorably affected, because the demand for coal was in excess of the supply. Later in the month the very encouraging annual reports of the Delaware, Lackawanna and Western and of the Delaware and Hudson stimulated good buying of these properties. Cutting of rates by some of the Granger roads encouraged attacks by the bears early in the month, and later there was an assault upon Reading and the Gould specialties, but the short interest was so largely increased by these speculative sales that the bull party were enabled to turn the market upward during the third week in the month, the prop-

erties which were most largely oversold were sharply advanced, and the tone was strong to the end of the month. In February the course of prices was downward, influenced by vigorous cutting of rates by roads in the Northwest, which soon involved all the Granger lines, and, toward the close of the month, by the strike of the engineers on the Chicago, Burlington and Quincy, caused by the refusal of a demand for increased wages, and also by the adherence of the company to its rule for a classification of engineers according to length of service and the character of the work they performed. Early in the first week of the month the pacific tenor of a speech by Prince Bismarck before the German Parliament had a stimulating effect upon the European markets, and the improvement there was reflected in our own. This was followed by selling some of the trunk-line stocks on the theory that the fight between the Granger roads would involve Eastern connections, but subsequently the action of the trunk-line executive committee in settling export rates and ignoring cuts by Western lines tended to bring about a reaction. During the second week the Granger war was less vigorously prosecuted, and the strike of the miners in the Schuylkill region was practically ended. This news aided in a decided recovery. The movement was irregular, although generally upward, in the third week, but during the closing days of the month the engineers' strike, selling of stocks for European account, and bearish demonstrations caused the market to close heavy. Rate-cutting was vigorously prosecuted by Western roads during March, until near the end, when there was an agreement to restore rates; but while the war was in progress the stocks of the Granger roads were more or less unsettled. Reading was unfavorably affected early in the month by decreased net earnings for January. The striking engineers of the Chicago, Burlington and Quincy were warring against the road in every conceivable manner, endeavoring to prevent its successful operation with non-union engineers, and rumors that other Western lines would be involved had a depressing effect. The embargo upon business in this section, and the suspension of trading on the stock-exchange, resulting from the blizzard of March 12, did not immediately unfavorably influence the market, for as soon as business was resumed purchases of stocks for European account carried prices sharply upward, but toward the close of that week news of the strike on the Atchison, Topeka and Santa Fé, the men sympathizing with the engineers of the Chicago, Burlington and Quincy, and rumors of similar trouble on the Union Pacific, brought about a downward reaction. Then followed a recovery, assisted by the declaration that the strike on the Chicago, Burlington and Quincy was practically ended, the company securing a full complement of new men, and also by the agreement of West-

ern roads to cease cutting and to restore rates; but before the close of that week Missouri Pacific fell heavily on a rumor, subsequently confirmed, that the dividend would be reduced. During the last week of the month Reading was attacked on the news that the statement for February would show a large loss in net earnings, and the market was more or less unsettled to the close in consequence of bearish attacks and disquieting rumors regarding the railroad situation in the West. The strike on the Chicago, Burlington and Quincy was officially declared off April 4, the attempt to induce the switchmen at Chicago to assist the engineers by refusing to handle freight of the company having failed, and this was the first signal defeat of the Brotherhood of Engineers since the strike of 1877. Another important event affecting the stock-market was the action of Congress on the Bond Purchase measure, which was immediately followed by an order by the Secretary of the Treasury directing purchases of 4 and 4½ per cent. bonds; and another event was the breaking of the deadlock in the House of Representatives over the Direct Tax Refund Bill, that body having been in continuous session for nine days, thereby obstructing important legislation. The movement in stocks was a little feverish during the first few days of the month owing to disquieting rumors from the West, but it soon felt the influence of the ending of the Chicago, Burlington and Quincy strike and of the other events above noted, and there was a substantial recovery in the market, which continued, almost uninterruptedly to the close, large purchases of bonds by the Secretary of the Treasury after the 23d almost daily stimulating an advance. The rise in some of the properties was so rapid during April, that in May realizing sales and bearish attacks were invited, and the tendency of the market was downward. The course of prices was, however, only gradually changed. In the first week of the month the bears sought to force declines, but their efforts appeared to be resisted by purchases for European and domestic account. The Northern Pacifics were favorably affected by reports of negotiations for the purchase of a large tract of land; and Missouri Pacific and the other Gould specialties advanced in consequence of speculative manipulation. The bears first attacked New England, Reading, and Union Pacific. Then advantage was taken of unfavorable weather for the crops to assail the Grangers. The decline was checked on the 16th by the news of the prompt taking in London of the Baltimore and Ohio loan for \$10,000,000, and this indicated the favorable reception of the Reading loan when that should be offered, but in the following week gold exports to Germany on special order were large, the liquidation of the pools in Reading, St. Paul, and New England was discovered, and persistent attacks by the bears carried prices downward until the 25th,

when news that a syndicate had bought \$24,688,000 of the Reading 4-per-cents, and \$11,946,880 of the first preference incomes caused a rise in that stock in which the whole market sympathized. During the last few days of the month, however, the bears renewed their attacks upon the market, assailing Missouri Pacific, New England, Reading, and St. Paul, and the fall in these made the movement more or less unsettled to the close. Stocks were unfavorably affected during June by the prolonged discussion of the tariff bill in the House; by the action of the Iowa railroad commissioners in promulgating rates below those formerly ruling; by cuts by the trunk lines; and by reduced dividends on some of the principal Western roads. One prominent event was the placing of the Reading 4-per-cent, fifty-year loan in London and New York, and another was the purchase by the Pullman of the Baltimore and Ohio palace-car outfit. The course of the market was irregularly downward until about the middle of the second week, when there was a reaction, due to a covering of short contracts, and prices were not affected by the news, on the 15th, of the death of the Emperor Frederick, of Germany, as the foreign markets were not in the least influenced thereby. During the third week the tendency was generally upward, and the existence of a large short interest not only aided in sustaining prices, but it encouraged the bulls to advance some of their specialties. The market gradually improved in tone and in activity during July. Crop-prospects were excellent; the Iowa railroad managers were looking for a favorable decision in their suit before the United States Court to restrain the Iowa railroad commissioners from enforcing the new distance tariff of rates, and there was good buying of stocks for European account. The Grangers, the coal-shares, the Gould specialties, and the Northern Pacific properties, took the lead early in the month. Then came a rise in Western Union, based upon the favorable outlook for the ending of the cable-rate war, and later there was an advance in Louisville and Nashville, encouraged by the expectation that a stock dividend would soon be declared. New York and New England and American cotton-seed oil certificates were the favorites with speculators in this class of stocks, and Delaware, Lackawanna and Western and Delaware and Hudson were directly affected by the improved prospects of the coal-trade. Toward the close of the month the Grangers were favorably influenced by the decision of Judge Brewer in the Iowa railroad cases, and thereafter for the remainder of the month the market was active and strong. In the first few days of August the leaders were New England, Lake Shore, Western Union, Reading, the other coal properties, and Union Pacific. The Grangers were favorably affected by news from the crops, and soon after the opening of the month one feature was a well-sustained specu-

lative movement in Delaware, Lackawanna and Western. During the first week there was a sharp fall in Central New Jersey, caused by the marketing of a block of stock owned by the Lehigh Valley, but when this was disposed of there was a rapid recovery. The tendency of the market was downward in the second week, the bulls among the traders having sold their stocks, and the bears being encouraged to indulge in raids. The Grangers were affected by news of frosts, and there was some selling of St. Paul in expectation of reduced dividends. Early in the following week there was a manipulated advance in the last-named stock, the coal-shares were pushed upward, and later the Vanderbilt specialties took the lead, followed by the Northern Pacifics and the Oregons, the two latter being affected by the news that the remainder of the Northern Pacific third mortgage had been sold to a Frankfort syndicate. Toward the close of this week the Grangers fell off in consequence of cutting of rates, and the Canadian stocks were unfavorably affected by the message of the President on the relations of this country with Canada. During the last week in the month there was a further advance in Delaware, Lackawanna and Western, and in the other coal-shares, in the Northern Pacifics, and in the Oregons, and later in the Grangers, which were influenced by the decision of State Judge Fairall in the Iowa railroad cases, he restraining the commissioners from putting into effect the new tariff. The market closed strong. European purchases of stocks, manipulation of leading Granger and coal properties, based upon a prosperous crop and coal season, and liberal buying of stocks by domestic investors and speculators caused prices to rise rapidly during the early part of September. Then followed a sharp fall in St. Paul, due to the passing of the dividend on the common stock, succeeded by as rapid a rise on news that the foreign stockholders had combined for mutual protection against the management, and one prominent feature thereafter was a well-sustained advance in New England. The market was generally strong to the close. One feature toward the end of the month was a heavy fall in Hooking Valley on the news that the arbitrators in the suit against J. S. Burke had decided against the company. Considering the fact that the news was unfavorable early in October, stocks held up remarkably well. There were unsettled grain-markets resulting from the wheat deal at Chicago, a good inquiry for money for the West, a suspension on the 10th of purchases of 4-per-cents. by the Secretary of the Treasury, the financial embarrassment of the Atchison, Topeka and Santa Fé, and liquidation by some of the pools in the specialties. Early in the second week the bears indulged in frequent raids, but the effect of these was to some extent counteracted by manipulation of New York and New England, the Grangers, Union Pacific, and Reading, and

also by liberal purchases of bonds by the Secretary of the Treasury. Toward the end of the week an unsettled market in Boston, due to a further fall in Atchison, Topeka and Santa Fé, affected the speculation here, but supporting orders caused the market to close strong. During the third week it was announced that the financial embarrassments of the Atchison, Topeka and Santa Fé had been relieved by the issue of three-year notes for \$7,000,000, secured by a short second mortgage, but this had only a temporary effect upon the stock, which steadily declined, unfavorably influencing New England and nearly all properties owned in or managed from Boston. An abstract of the annual report of the Missouri Pacific making unsatisfactory disclosures caused a sharp fall in that property, and about the only strong stocks during the remainder of the week were the Vanderbilt specialties, Union Pacific, Richmond Terminal, and the East Tennessees, the two latter being affected by the lease by the former of the East Tennessee, Virginia, and Georgia. In the early part of the last week of the month one feature was a fall in Reading incomes, caused by doubts as to the ability of the company to meet the interest, and this decline affected the stock. Another feature was a further fall in Atchison, Topeka and Santa Fé on the publication of the annual report. Then came a rise in the Gould specialties, assisted by a rumor, which was subsequently denied, that Mr. Gould had obtained control of the Atchison, Topeka and Santa Fé, and this was followed by an advance in New England, American cotton-seed oil, and in other low-priced specialties. There was a fairly strong tone to the market during the first few days of November, and a very confident feeling that no matter what was the result of the presidential election there would be a more active speculation. On the day following the election the market opened very strong, but there was an immediate selling movement, mainly due to realizations, assisted by rumors of rate troubles on the trunk lines, and the tendency was generally downward for the remainder of the week. On the following Monday the announcement was made that the New York Central had ordered a reduction of one third in the rates for west bound business, the excuse being that some of the other lines were getting traffic by cutting rates. This caused free selling of all the trunk-line stocks, confidence in the future of the market was unsettled, the bears were encouraged to raid leading properties, and the tendency was downward for the remainder of the week and until about the middle of the following week, when news that the Southwestern troubles were likely soon to be adjusted and that negotiations had been opened for settlement of the trunk-line differences started a covering of short contracts which carried the market upward. Then came news of large withdrawals of gold on special order for Berlin and

London, and this again encouraged attacks by the bears, but later the declaration of the usual dividends on the Chicago and Northwestern and a confirmation of reports that an agreement had been made to restore rates among the Southwestern roads brought about a recovery, and the market closed strong for all except New England, which was freely sold in consequence of the closing of the transfer books, thus setting at rest rumors that there would be a contest for control. The tendency was generally downward for the remainder of the month, with a sharp fall in Rock Island as the feature during the last week, but the trunk lines were inclined to improve on news that a partial agreement had been made to restore rates on west bound business. In December the course of this market was generally downward until toward the close. During the first week Atchison, Topeka and Santa Fé and Missouri Pacific were unsettled and lower, and the last-named stock sold at the lowest figures recorded since 1884, but there was subsequently a recovery on the announcement that at a meeting of the executive committee an order had been issued to take no more business except at remunerative rates, it then appearing that the tariff had been cut about 40 per cent. on some classes below the published schedule. Toward the close of the week the whole market advanced on news that rates would be restored on the 17th on the trunk lines. In the second week the tone was generally stronger under the lead of the coal-shares, and it was also favorably influenced by the declaration of the usual quarterly dividend on Missouri Pacific. Rock Island was, however, freely sold at intervals in expectation that the dividend would be reduced. During the third week the market was favorably affected by united efforts on the part of Western railroad managers to put an end to the demoralization which existed in that section and in the Southwest. Agreements were formulated and generally signed to restore rates on freight on January 1, and to prevent further cuts in passenger tariffs by withdrawing tickets in the hands of brokers. Toward the close of the week an important conference was held in New York, at which were present the presidents of all Western lines, except the Chicago and Alton, and representatives of three leading banking-houses with foreign connections, and at this meeting it was agreed that the rates then ordered restored should be maintained. This action was regarded as definitely settling the railroad situation, the market responded in a very decided rise, which was assisted by a manipulated advance in Delaware, Lackawanna and Western, and the tone was strong at the close of that week. The declaration of a 1-per-cent. quarterly dividend on Rock Island caused a further fall in that stock to the lowest figures since 1877, but it subsequently reacted. Early in the last week of the month the market was favorably influenced by the declaration of the

dividends on the Vanderbilt specialties, and by a further improvement in the Western railroad situation; but it was a little irregular after Wednesday in consequence of active money, although the tone was generally strong to the close. Total sales of all stocks for the year 1888 were 65,179,206 shares against 85,291,028 in 1887; 100,802,050 in 1886; 98,184,478 in 1885; 95,416,868 in 1884; 96,037,905 in 1883; 113,720,665 in 1882; 113,892,685 in 1881; and 97,919,099 in 1880. The transactions in Government bonds at the New York Stock Exchange in 1888 were \$6,573,700, and in railroad and miscellaneous bonds, \$345,214,057. The following table shows quotations of leading stocks at the beginning of January, 1887, 1888, and 1889:

LEADING STOCKS.	1887.	1888.	1889.

FINE ARTS IN 1888. Under this title are treated the principal art events of the past year, ending with December, 1888, including especially the great exhibitions in Europe and the United States, the sales and acquisitions of works of art, and the erection of public statues and monuments.

Paris: Salon.—The exhibition (May 1 to June 30) comprised 5,528 numbers (selected from 7,640 presented), classified as follows: Paintings, 2,586; cartoons, water-colors, pastels, porcelain pictures, etc., 1,119 sculpture, 1,059; engraving in medals and precious stones, 57; architecture, 180; engraving, 522.

Section of painting: Medal of honor awarded to Édouard Detaille by 108 votes against 96 to Benjamin-Constant. First-class medals: Paul Louis Delance, Nils Forsberg. Second-class medals: Gustave Édouard Le Sénéchal, Gaston Latouche, Auguste Joseph Truphème, Nicolas Berthon, Aimé Perret, Louis Victor Watelin, Louis Le Poittevin, Arsène Rivey, Paul Leroy, Auguste Flameng, Georges Callot, Maurice Jeannin. Third-class medals: Édouard Grandjean, Jean Brunet, Joseph Aubert, Abel Boyer, Léon Boudot, Émile Isenbart, Amand Laroche, Léon Richet, Franc Lamy, Alexis Vollon, Alfred Smith, Daniel Ridgway Knight, Théophile Henri Décanis, Walter Gay, Jacques Louis Odier, Guignon, Adrien Jourdeuil, William Henry Howe, Paul Lecomte, Eugène Dauphin, Étienne Tournès, Paul Schmitt, J. Gari Melchers, John Lavery, Eugène Laurent Vail, Michel Matsus, Henry Mosler, Aymar Pezant, François Sallé, Gotthardt Kuehl, Karl Cartier, Johannes Grimelund, Mlle. Maximilienne Guyon.

Section of sculpture: Medal of honor awarded to Jean Turcan, by 98 out of 168 votes. No first-class medal awarded. Second-class medals: Henri Louis Levasseur, Eugène Quinton, Camille Lefèvre, Louis Joseph Enderlin, Joseph Gardet, Pierre Barbaroux. Third-class medals: Louis Dominique Mathet, Louis Auguste Baralia, Léon Kinsburger, Ringel d'Ilzsch, Hippolyte Peyrol, Léon Pilet, Charles Jacquot, Louis Holweck, Eugène Robert, Paul François Chopin, François Pompon, Christian Erickson.

Section of engraving: Medal of honor awarded to Edmond Hédouin, by 99 votes against 60 to Achille Jaquet. No first-class medal awarded. Second-class medals: Léon Boisson (line engraving), Auguste Hilaire Laveillé (wood). Third-class medals: Messrs. Eugène Fornet, Ricardo de los Rios, Paul Émile Letarrier, Claude Faivre, and Mme. Marie Louveau-Rouveyre (etching); Charles Théodore Dehlois (line); Hippolyte Constant Dutheil, Théodore Delangle, Jean Baptiste Guillaume, Claude Faivre (wood); Georges William Thornley, Hippolyte Fauchon (lithography).

Section of architecture: Medal of honor awarded to Henri Adolphe Deglane, unanimously. First-class medal: Charles Louis Girault. Second-class medals: Jean Hardion, Gabriel Rupricht-Robert, Jean Bréasson, Gaston Redon, Charles Georges Roussi. Third-class medals: Émile Jay, Arsène Pierre Lafargue, Eugène Rigault, Paul Laffolloy, Édouard Michel Lewicki, Augustin Salleron.

Édouard Detaille, to whom was awarded the medal of honor, exhibited an enormous landscape crowded with figures, entitled "Le Rêve," which must rank as his masterpiece. It repre-

sents a plain just after dawn, with gently rising land occupied by a host of French infantry bivouacking on the heather, among white bowlders and wild flowers, with sentinels guarding piled arms and watch-fires with drifting smoke. Above, in a cloudy sky tinged with rosy light, is a vision of innumerable soldiers of the First Empire, infantry, cavalry, and artillery, with eagles and shot-torn banners, moving eastward in noiseless array.

Benjamin-Constant, who stood next to Detaille in the contest for the medal of honor, was represented by a huge decorative triptych, entitled "L'Académie de Paris, les Lettres, les Sciences," destined for the Salle du Conseil, in the Sorbonne. In the middle division, seated in a semi-circle of columns, are the rector and elders of the Academy, (all portraits), in modern costumes under amber, red, black, and violet gowns. In "Les Lettres" a muse in green and black is addressing the muses of lyric poetry, history, and tragedy, grouped on a marble bench in a splendid portico. In "Les Sciences" are figures typifying astronomy, engineering, etc., one of whom is instructing a workman. The work is distinguished, like all the artist's pictures, for vivid coloring and rich imagination.

Paul Louis Delance, first-class medalist, illustrated on another huge canvas "La Légende de Saint-Denis." In a landscape of ancient Paris and its environs, with a summer atmosphere and sky, the saint, who has been decapitated, walks to the resting-place which bears his own name, carrying his own head, his shoulders and bleeding neck being decorated with a gilded nimbus. The peasants, who are startled at meeting the apparition, are full of spirit, and a kneeling woman is very pathetic. Notwithstanding the incongruous subject, the artist has made a noble picture, striking in massing and coloring.

An enormous composition of nude figures, more than life-size, is Albert Maignan's "Les Voix du Tocsin." A great bell, hung in a lofty tower, is rung by the hands of spirits who, swinging in the air, tug at the ropes with might and main. Other demons hover around the clanging bell, while a third set scream, shout, and weep as they fly out from beneath it. Below is a conflagration with ruddy glare and drifting smoke. The conception is poetical, and the draughtmanship and coloring excellent.

Opposite it hung "L'Enlèvement de Proserpine," by Ulpiano Checa, a pupil of the Academy of Madrid. Though somewhat theatrical in parts, the four black horses of Pluto, with breath of smoke and eyes of fire, are notable for excellent painting and good foreshortening.

Bouguereau's "Premier Deuil" represents Adam and Eve mourning over the corpse of Abel. Adam, seated, holding across his knees the body of his son, stoops to kiss the head of Eve who, kneeling by his side, weeps with hands clasped to her face. The figures, life-size, are magnificent studies of the nude, so

colorless as to look like sculptures, but full of dignity, grace, and feeling. Another contribution by this master, entitled "Baigneuse," is a life-size, full-length, nude figure of a beautiful young girl, drying one foot on a rock while steadying herself by holding a hanging bough.

"Esclaves à Vendre," by Gustave Boulanger, represents slaves exposed for sale in Rome. A Gallic maiden, nude, with a wooden label fastened about her neck, leans wearily against the wall, while a huge Numidian, with impassive features, his arms embracing his knees, squats on the ground beside her.

Jules Lefebvre's "L'Orpheline" shows a nobly-painted church interior, with an old woman in cloak and hood kneeling in prayer in one of the pews, and a pale child clad in mourning seated beside her, looking outward with sorrowful eyes, as if in a dream. It is a pathetic work, of masterly execution.

"La Naissance de Benjamin," by Émile Lévy, is an interior with small, full-length figures. A pallid mother lies on a couch covered with white bed-linen, while an attendant, holding the child poised on one hand, turns toward her, and other women stand around. It is a broad, massive composition, of delicate and harmonious tone.

Jules Breton's "Jeunes Filles se rendant à la Procession" is a village scene with a procession of peasant girls, such as he loves to paint.

Lhermitte's "Le Repos," shows a group of reapers, more robust and real than Breton's peasants, and firmly and broadly treated.

Philippe Roll's "Manda Lamétrie, Fermière," a milkmaid with filled pail, standing beside a cow, in an atmosphere of light and sunshine, is a remarkable work, with reminiscences of Bastien-Lepage.

"The Communion," of Henry Lerolle, is a large canvas, with life-size figures of women in brown, gray, and black dresses, listening to a priest addressing the communicants kneeling at the altar-rail of a vast church. It is in the simple, flat tones characteristic of the painter, so noticeable in his earlier work, "Jeune Fille chantant dans une Église," now in the Metropolitan Museum, New York.

Henner is represented by a Saint Sébastien, a nearly life-size corpse lying among rocks, with three women, one of whom is drawing an arrow from the body; and by a portrait, a girl with heavy masses of red hair flowing over her bosom, which is partly draped with a light-blue robe falling from the shoulders.

Hébert's "Aux Héros sans Gloire," a mournful woman with impassive features and dark eyes set in an olive face, her unbound black tresses crowned with laurel, sits in a mysterious half-gloom—the genius of heroic Death. She wears a purple robe bound with a black girdle, and leans with one arm on a marble urn, while a wreath of convolvulus drops from her hand.

Pictures exhibited by American artists: J. C. Arter, "Interieur-Picardie"; Edmond Aubrey-Hunt, "Honfleur"; Henry Bacon, "Construction d'un Bateau"; William Baird, "La Seine";

Ellen K. Baker, "Rêverie" and "Un Nourrisson"; Edward H. Barnard, Portrait; Henry Bisbing, "La Sieste sur le Rivage—Hollande" and "Un Coin de la Ferme—Normandie"; Sadie Blackstone (Canada), "Senlis—Vallée de Chevreuse"; Carl Blenner, Portrait; Émile Boggio (Venezuela), "Lecture"; Frank M. Boggs "Harfleur" and "Le Havre"; Dwight F. Boyden, "La Route de Lafaux" and "L'Antonine"; Amanda Brewster, Portraits (2); Frederick A. Bridgman, "Dans une Villa de Campagne—Alger" and "Soit d'Été—Alger"; Blair Bruce (Canada), "Le Fantôme de la Neige"; Edgar Cameron, "Dans l'Atelier"; Kate Augusta Karl, "Le Choix d'une Romance"; Leslie G. Cauldwell, Portrait; François B. Chadwick, "La Mère Rabicotte"; Murray Clinton-Smith "Dans les Marais de Criquebœuf"; Maximilien Colin, "Atelier de Dames"; Irving Consee, "Fleur de Prison"; L. H. Coynes, "Nature Mort"; Alger Courrier, "Déesse" and "A la santé!"; Ralph Curtis, "Carmen"; George D. Monfried, "Chemin en Oerdagne" and "Église d'Angoustrine"; Wilder Darling, "La Première Visite de la Grand'mère"; Charles H. Davis, "Un Soir d'Hiver" and "Avril"; Louis Paul Dessar, "L'Orphelin"; Henry Patrice Dillon, "Mort de Paul Bert"; William L. Dodge, "David"; Pauline Dohn, "Tête d'Enfant"; J. D. P. Douglas, "Brutalité"; Julie Dunn, "Automne"; Frank Duveneck, Portrait; José Thomas Errazuriz (Chili), "Sur les Dunes" and Portrait; Charles S. Forbes, Portrait; Jesse Leach France, "Marée Basse—Bretagne"; Elizabeth Jane Gardner, "Deux Mères de Famille"; Walter Gay, "Le Bénédictioit" and "Un Asile"; Rosalie Gill, Portrait; Abbott Graves, "Pivoines"; Clifford Grayson, "Étude"; Eleanor Greatorex, "Pasqua Fiorita—Florence"; Kathleen Greatorex, "Les Fleurs du Vent—Florence"; R. Hewett Green, "Marchande de Fleurs"; Charlotte Gore Greenough, "Entrée de la Château de la Grand' Cour, près Dinan"; Edward Grenet, "Ballade à la Lune"; Peter Alfred Gross, "Place de la Fontaine, à Liverdun," and "Liverdun sur la Moselle"; Philip L. Hale, "Petite Fille aux Chrysanthèmes"; Alexander Harrison, "Marée Haute"; Birge Harrison, "Départ du Mayflower"; A. Butler Harrison, "La Lande"; Herman Hartwich, "Le Sieste"; Childe Hassam, "Jour du Grand Prix"; Herman G. Herkomer, Portrait; Bertha Hewit, "Les Sœurs"; George Hitchcock, "L'Annonciation"; S. Francis Holman, Portrait; Samuel Isham, Portrait; Louisa Rogers Jewett, Portrait; John Kavanagh, "Le Maître d'École de Village" and Portrait; Anna Elizabeth Klumpke, "À la Buanderie" and Portrait; Daniel Ridgway Knight, "L'Appel au Passeur"; Eugene Armand La Chaise, Portrait; Lucy Lee Robbins, "Nonchalance" and Portrait; Pedro Francisco Lira (Chili), "Femme Chilienne Vouée à Notre-Dame-de-Merci" and "Raccommodeuse Chilienne"; Eurilda Loomis, "Vie Rustique—Picardie"; Francis W. Loring, "Le Pont à Chioggia"; Albert Lynch (Peru), "L'Hiver"

and "Sortie de Bal"; Walter Mac Ewen, "Une Histoire de Revenant"; Ernest L. Major, Sainte-Geneviève"; William L. Maroy, Portrait; Arthur F. Matthews, "Pandore" and "En Hollande"; J. G. Melchers, "Les Pilotes"; Willard Leroy Metcalf, "Marché de 'Kousse Kousse' à Tunis"; Arturo Michelena (Venezuela), "Charité" and "Étude"; Henry Mosler, "La Captive Blanche" and "Fête de la Moisson"; Albert H. Munsell, "Navire Droit Devant"; Carl Newman, "Une Religieuse"; Elizabeth Nourse, "Une Mère!"; Stephen Hills Parker, "Pandore"; Charles Sprague Pearce, "La Rentrée du Troupeau"; Clinton Peters, Portrait; William L. Picknell, "Novembre—Solitude"; J. A. Prichard, "La Prière"; Robert L. Reid, "La Fuite en Egypte"; Charles S. Reinhart, "L'Attente des Absents" and "La Marée Montante"; Theodore Robinson, "Un Apprenti Forgeron"; Pedro Rodriguez Flyel (Venezuela), "La Fête d'une Jeune Mère" and Portrait; Cristobal Rojas (Venezuela), "Première Communion" and "Vente par Autorité de Justice"; Julius Rolshoven, "Hamlet"; Andre Santa-Maria (Colombia), "Un Refuge"; Frank Scott, "Retour de la Pêche"; Robert V. V. Sewall, Portrait; Edward E. Simmons, "Le Fils du Charpentier" and "Mère et Enfant"; Marie Simpson, "Le Déjeuner du Pauvre"; Eduard Sivori (Buenos Ayres), "La Mort d'un Paysan" and "Sans Famille"; Frank Otis Small, "Ramsès et sa Fille jouant aux Échecs"; William J. Smedley, "Le Bateau du Père"; Ellen Starbuck, Portrait; Julius L. Stewart, Portrait; Frank W. Stokes, "Les Orphelines" and "Un Bon Sermon"; George M. Stone, Portrait; Charles H. Strickland, Portrait; Elizabeth Strong, "Les Orphelines"; Frances Hunt Throop, "Le Réveil"; Georgette Timplin, "La Moisson"; Gaylord S. Truesdell, "Le Berger et Son Troupeau"; Miss Sydney Tully (Canada), "Étude"; Miss Jessie B. Tuttle, "Un Coin de Village"; Alfredo Valenzuela-Puelma (Chili), Portrait; Pierre L. L. Vauthier (Brazil), "Le Port de Rouen"; Robert W. Vonnoh, Portrait; Lionel Walden, "Sur la Tamise"; Charles T. Webber, Portraits (2); Cecilia E. Wentworth, Portrait; Ogden Wood, "Dans les Dunes"; Percy Woodcock (Canada), "Fin du Jour."

The Salon receipts for the season were 400,000 francs, which leaves, after deducting 240,000 francs for expenses, 160,000 francs to be added to the invested capital of the Société des Artistes Français. As this amounted last year to 747,429 francs, the Société now has a capital of more than 900,000 francs, for the advancement of the arts and to the aid of unfortunate artists.

Paris: Miscellaneous.—The National Museums of France—the Louvre, the Luxembourg, Versailles, and Saint-Germain—and all objects of art in state buildings are, by a decree of last September, placed under one director, appointed by the President of the republic on the nomination of the Minister of Instruction. His official quarters will be in the Louvre.

A gallery of portraits of artists, painted mostly by themselves, similar to that of the Uffizi, Florence, was opened in the Pavillon Denon, at the Louvre, in February. It constitutes already a very valuable collection, made up of works from Versailles, the Louvre, the Luxembourg, the École des Beaux-Arts, and other public galleries.

The Académie des Beaux-Arts, section of painting, elected as a member, in place of Gustave Boulanger, deceased, Gustave Moreau, by 19 votes, against 10 for Jules Lefebvre, 5 for Jean Jacques Henner, and 1 for Émile Lévy.

The École des Beaux-Arts has had under instruction during the past year 1,220 pupils, of whom 600 were in the architecture classes, while only about 400 were students of painting. During the same time the Royal Academy of London had only about 200 pupils.

The sale of the Goldschmidt collection in Paris, in May, produced in the aggregate 1,067,094 francs, of which the fifty-three pictures by modern masters brought 795,570 francs. Among the best prices obtained, were: Troyon, "Vallée de la Touque," 175,000 francs, bought by M. Bischofsheim; "La Barrière," 101,000 francs; "L'Abreuvoir," 85,000 francs; "Chèvres et Roses," 16,000 francs. Delacroix: "Côtes du Maroc," 80,000 francs; "Hermine et les Vergers," 25,400 francs; "Christ en Croix," 15,600 francs; "Enlèvement de Rebecca," 29,100 francs; "Joueurs d'Échecs," 12,200 francs; "Cavalier Grec," 9,200 francs. Dupré: "Moulin à Vent," 20,100 francs; "Sous Bois," 16,710 francs. Théodor Rousseau: "La Rivière," 25,000 francs; "Fôret de Fontainebleau," 7,000 francs. Décamp: "Une Cour de Ferme," 80,400 francs; "Paysan Italien," 12,000 francs; "La Porchère," 19,200 francs; "Boule Dogue et Terrier," 16,000 francs (Louvre). Meissonier: "Le Docteur," 17,000 francs. Ziem: "Vue de Venise," 26,000 francs. Géricault: "Amazone," 8,500 francs.

The collection of Comte Duchatel, ancient and modern pictures, sold in Paris, May 14, brought 176,250 francs. The highest prices realized were: Jules Breton, "Les Vendanges à Ohâteau-Lagrange," 29,100 francs; Meissonier, "Un Poète," 40,000 francs; Ruysdæl, "Cascade," 80,000 francs; Van der Heyden, "Eglise et Place de Ville," (Holland), 19,500 francs.

The Poidatz collection, sold in Paris in March, produced in the aggregate 116,000 francs. Daubigny's "Pont de Mantes" and Millet's "Tonte des Moutons" (sheep-shearing) brought each 13,000 francs.

The Gellinard collection, sold March 19, produced 199,916 francs. Corot's "Diana and Nymphs" brought 12,000 francs, and his "Martyrdom of St. Sebastian," 15,000 francs.

The sale of the works of the late Gustave Guillaumet, painter, in Paris, realized 265,000 francs. His work entitled "Le Désert," was presented by the family to the state.

A monument to Gambetta, a pedestal of stone

crowned by a group in bronze, representing a young woman seated on a winged lion—symbolizing "Triumphant Democracy"—with other symbolic groups at the base, was unveiled, July 13, in the Place du Carronsel, Paris. It is the work of MM. Boileau, architect, and Aubé, sculptor, and was erected by subscription.

A bronze statue of Shakespeare, by Paul Fournier, presented to the city of Paris by William Knighton, was unveiled, October 14, at the intersection of the Boulevard Haussmann and the Avenue de Messine. The figure is three metres and ten centimetres high, on a pedestal four metres and fifty centimetres.

London: Royal Academy.—The nineteenth winter exhibition was devoted, as usual, to works of the old masters and deceased British artists, gathered from public and private collections, with the additional attraction of a collection of sculpture and Renaissance bronzes and medals. Only about 160 pictures were shown, but among them were Titian's "Europa"; Ribera's "St. Jerome praying in the Desert"; Velasquez's "Femme à l'Éventail" and "Don Balthazar Carlos"; Claude's "Europa" and "Enchanted Castle"; and several Rembrandts and Vandykes. There were also examples of Hobbema, Ruysdæl, Jan Steen, Hals, and Van de Velde, and of Reynolds, Gainsborough, and others of the British school.

The one hundred and twentieth annual exhibition opened in May with 2,077 numbers, selected from nearly 6,000 contributions, including oil-paintings, water-colors, works in black and white, architectural drawings, and sculptures. The total attendance during the season was 356,118; total receipts, £23,346; total value of works sold, £21,599.

Of first importance among the pictures exhibited is Sir Frederick Leighton's "Captive Andromache," a decorative work measuring seven feet by fourteen, illustrating the passage in the Iliad where Hector tells of his prevision of her fate, when she shall have fallen into the hands of the Greeks. The scene represents the farmyard of Pyrrhus, in Thessaly, with buildings on the left; on the right is a fountain pouring from a lion's head in the wall into a marble basin, and between them a long vista of trees and meadows, with an intensely blue sky laden with white thunder-clouds. In the middle, Andromache, clad in black, forms one of a company of women slaves who, at decline of day, have gathered at the fountain. Standing with her chin resting in one hand, while the other sustains her elbow, she is half-aroused from her sorrowful memories by the gambols of an infant, the center of a group in the foreground at the right. Near the front three stalwart peasants look toward her as they walk quickly past, and at the left, behind Andromache, are children and another group of damsels. It shows all of Sir Frederick's peculiarities, and is marked by fine drawing, learned conventionalism, painstaking care, and grace, but is rather an elaborate bas-relief than a scene of life.

Alma-Tadema's "Roses of Heliogabalus" illustrates one of the boyish pranks of the emperor of nineteen, who has overwhelmed his guests at a banquet by a shower of roses which slaves have been heaping on the velarium overhead as the feast proceeded. Heliogabalus, his lentil-shaped eyes suggesting his Syrian origin, reclines, partly covered with a mantle of cloth of gold, on a silver couch, holding near his lips a cylix, from which he delays to drink, as he watches the struggles of his guests. In technical skill and in richness of color the painter has never excelled this work, but its want of composition leads one to regret that so much labor has been spent on such a subject.

Sir John Millais's "Oairnleeth Moss, Birnam" (4½ x 7 feet), may serve as a companion-piece to "Over the Hills and Far Away." All the foreground is marsh with clumps of moss and rushes mirrored in tinted pools; in the mid-distance is meadow-land with a dark belt of pines, and in the background rugged hills. His "Murthly Moss, Perthshire" (5 feet square), represents Murthly Oastle at Christmas-eve, 1887, with the warm light of late afternoon on the snow, over which crows are skimming.

Solomon J. Solomon's "Niobe," one of the successes of the year, depicts the anguish-stricken mother standing upon a flight of steps, convulsively clinging to the dead body of one of her children, with the dead and dying forms of the others around her. The work is full of strength and vigor, and suggestive of a brilliant future for the artist.

Orchardson's "Her Mother's Voice" represents a middle-aged widower listening to his daughter as she sings, attended by her lover.

The exhibition was strong in portraits and in landscapes, but want of space will not permit their enumeration.

The new associates elected by the Royal Academy are: W. B. Richmond, Onalof Ford, and Arthur Blomfield.

The pictures purchased for the Chantry Bequest are: Vicat Cole's "Pool of London"; W. Logsdail's "St. Martin's-in-the-Fields"; Adrian Stokes's "Upland and Sky"; and Frank Bramley's "A Hopeless Dawn."

London: Grosvenor Gallery.—The winter exhibition, called "A Century of British Art," consisted of pictures by British painters between 1787 and 1887, among them being Hogarth, Reynolds, Gainsborough, Lawrence, Mulready, Wilkie, Ramsay, Raeburn, Opie, Constable, Calcott, Bonington, Collins, Linnell, and Wilson. Hogarth was represented by twenty-five canvases, comprising "Garrick as Richard III," "Garrick and his Wife," "Peg Woffington," "The Lady's Last Stake," and "Monamy showing a Picture."

The twelfth summer exhibition of the Grosvenor Gallery, opened as usual in May, was chiefly noteworthy for the absence of contributions by many artists whose names have heretofore been the fortune of the enterprise.

Among the more conspicuous pictures were: Jacobb Hood's "Triumph of Spring," John Reid's "Smugglers," Arthur Hacker's "By the Waters of Babylon," and W. F. Britten's "Noble Family of Huguenot Refugees shipwrecked on the Suffolk Coast." One of the best portraits as well as one of the best pictures in the exhibition was E. F. Gregory's "Miss Mabel Galloway," a young girl in crimson, seated at a table amid elaborately-painted accessories. Briton Riviere's "Adonis's Farewell," is really a painting of dogs. McWhirter, Philip R. Morris, Henry Moore, Keeley Hallswell, W. J. Hennessy, Mark Fisher, Ernest Parton, and other well-known names, were represented by landscapes and sea-pieces.

London: New Gallery.—This gallery opened in May, in Regent Street, under the management of Comyns Carr and C. E. Hallé, was the result of troubles in the Grosvenor Gallery management, which led to the secession of a number of painters, among them Alma-Tadema, Burne-Jones, W. B. Richmond, Hubert Herkomer, Holman Hunt, George F. Watts, and Prof. Legros.

Among the most noteworthy contributions are three by Burne-Jones who, though elected an associate of the Royal Academy in 1885, seems to prefer to exhibit elsewhere. The first of these, called "The Rock of Doom," is a nude full-length standing Andromeda, chained to the rock in the sea, just discovered by the winged-sandaled Perseus, who is soon to deliver her. "The Doom fulfilled" is the sequel, showing the hero, encircled by the coils of the almy sea-monster, wielding his Hermes-given sword with fatal effect. "The Tower of Brass," a tall canvas (7 feet 5 inches x 8 feet 10 inches) hanging between these two, represents the story of Danaë, who, in a crimson robe over a violet dress, stands watching the building of King Acrisius's brazen tower.

Alma-Tadema sent six works, two portraits, a study, a sketch for the "Heliogabalus" in the Royal Academy, a small canvas entitled "Venus and Mars," and another called "He loves me, he loves me not," representing a girl on a green couch beneath a window, picking the petals of a flower, while another languidly watches her.

"The Angel of Death," by G. F. Watts, represents a figure with dark-gray wings, in a gray-green robe and white headdress, soothing a sleeping babe as she gently draws it toward herself.

Hubert Herkomer, W. B. Richmond, and Frank Holl contributed portraits; Sir John Everett Millais, two works, entitled "Forlorn" and "The Last Rose of Summer," both female figures; Prof. Legros, a "Dead Christ" and "Femmes en Prière"; C. E. Hallé, a "Paolo and Francesca"; and J. R. Weguelin, a canvas, 4 x 9 feet, representing "Bacchus and the Choir of Nymphs," reclining on the seashore.

London: Miscellaneous.—At the sale of the pictures of Charles Waring, deceased, held in Lon-

don, April 28, the following prices were obtained: Munkacsy, "Christ before Pilate" (original study for the large picture), 900 guineas. Constant Troyon, "The Ferry," 3,500 guineas; "Harrowing," 1,330 guineas; "The Watering Place," 560 guineas. Among pictures of various owners, sold at the same time, were: D. G. Rossetti, "Proserpina," 710 guineas; "Vision of Fiammetta," 1,150 guineas. Rosa Bonheur, "Labourages Nivernais" (replica of picture in Luxembourg), 4,300 guineas. Turner, "Burning of Houses of Parliament in 1834," 1,500 guineas. Thomas Faed, "Reading the Bible," 1,750 guineas. Hook, "Gold of the Sea," 1,640 guineas.

The Marton Hall collection of seventy-one pictures, formed by the late H. W. F. Bolckow, M. P., sold May 5, brought in the aggregate £71,387. Among them were: Rosa Bonheur, "Return from Pasture" (1862), 2,050 guineas; "Deer crossing Rocks in Forest of Fontainebleau" (1865), 1,740 guineas; "Denizens of the Highlands" (1857), 5,550 guineas. Constant Troyon, "The Water-Cart" (bought from the artist for £40), 2,000 guineas (Agnew). Meissonier, "Refreshment" (1865), 1,970 guineas. Landseer, "Braemar" (1857), 4,950 guineas (Agnew); "Intruding Puppies" (1821), 1,000 guineas (Colnaghi); "Taking a Buck," 1,950 guineas. Millais, "Northwest Passage" (1874), 4,000 guineas (Agnew). Turner, "Old London Bridge," 2,800 guineas (Colnaghi). W. Müller, "Ancient Tombs and Dwellings in Lycia" (1844), 3,750 guineas. F. Goodall, "Subsiding of the Nile" (1873), 1,450 guineas. David Cox, "Counting the Flock" (1852), 1,980 guineas; "Driving Home the Flock," 1,800 guineas. William Collins, "The Skittle Players" (1832), 1,510 guineas. Thomas Faed, "The Silken Gown," 1,450 guineas; "Baith Faither and Mither," 1,350 guineas.

The Gattou Park collection, formed by Lord Monson early in the present century, sold May 12, contained twenty-one pictures, which brought £11,439. Among them were: Leonardo da Vinci (or Cesare da Cesto), "Vierge au bas-relief" (bought from Woodburn at 4,000 guineas), 2,100 guineas (Davis). Nicolas Maas (or Karl Fabritius), "The Card Players," 1,310 guineas (National Gallery). Sir Joshua Reynolds, "Pick-a-back" (Mrs. Payne Gallwey and her son), 4,100 guineas (Agnew). At the same time were sold: Gainsborough, "Hon. Mrs. Henry Fane" (1778; sold last year for 4,850 guineas), 2,900 guineas (Davis); "Elizabeth, Duchess of Grafton," 970 guineas. Romney, "Lady Hamilton reading the 'Gazette' of one of Nelson's Victories," 1,250 guineas (Agnew).

Collection of the late T. Walker, sold June 2: David Cox, "Collecting the Flock," 2,250 guineas. John Linnell, "Hampstead Heath," 1,510 guineas. Carl Müller, "Bay of Naples," 1,500 guineas; "Salmon Traps on the Liede" (1862), 1,500 guineas. William Collins, "Barmouth Sands" (1835), 1,000 guineas. Patrick

Nasmyth, "View in Hampshire" (1826), 1,010 guineas. Rosa Bonheur, "Spanish Muleteers crossing the Pyrenees" (1857), 3,600 guineas (Agnew); "Brittany Shepherds" (1854), 1,000 guineas. Landseer, "The Hunted Stag" (1859), 2,850 guineas.

At the sale of the Marquis of Exeter, June 7 and 8, thirty-nine pictures brought £9,224. Among them were: Jan Van Eyck, "Madonna with St. Margaret" (1426), 2,500 guineas (Murray). On the same day was sold a Rubens, "Portrait of the Artist and his Wife," from Packington Hall collection, for 2,500 guineas (Agnew).

Alma-Tadema's "Vintage Festival" has been purchased for the Melbourne (Australia) museum.

Lord Lansdowne's "Cuyp" and his two Rembrandt's, "Portrait of a Lady" and "Portrait of the Painter," have been sold to Sir Edward Guinness for £50,000.

A statue of Sir Bartle Frere, by Brock, has been erected on the Thames Embankment. Statues of Gen. Gordon, by Stuart Burnett, and one of William Wallace, by G. Stevenson, have been unveiled at Aberdeen.

Glasgow.—The International Exhibition was formally opened on the 8th of May by the Prince and Princess of Wales. There were ten fine-art galleries, of which two were devoted to loan pictures in oil by British artists; one by sale pictures in oil by British artists; one by loan pictures and one by sale pictures in oil by foreign artists; two by water-colors; one by sculpture; and two by architecture and photography. The exhibits numbered nearly 2,700.

Stratford-on-Avon.—A monument to Shakespeare was unveiled in September. It is a bronze statue of the poet seated, reading a book, on a granite pedestal, at the angles of which are bronze figures of Hamlet, representing philosophy; Falstaff, comedy; Prince Hal, history; and Lady Macbeth, tragedy.

Brussels.—"L'Homme à la Houe" ("The Man with a Hoe"), Millet's celebrated picture, has been sold to M. Van den Eynde, for 84,000 francs. It was bought at the Salon of 1863, by M. Blanc, for 1,500 francs; was afterward in the Defoer collection, Paris, at the sale of which it brought 59,000 francs.

Copenhagen.—The exhibition illustrating the art, industries, and natural products of Denmark, Sweden, and Norway, and of the art-industries of foreign nations, was held in the Tivoli Gardens. Of foreign countries, Russia and France were best represented; Germany and Italy also made a good show.

Dresden.—The first large exhibition of paintings in water-color opened in Germany, held last winter, proved a great success.

Munich.—The collection of Count Salm Reiferscheid, sold in September, realized 334,980 marks. Some of the best prices obtained were: Andreas Achenbach, "A Valley," 27,100 marks; "Château on the Rhine," 13,000

marks; "Chestnut Forest," 9,800 marks. Constant Troyon, "Passing Cattle," 22,700 marks. Benjamin Vautier, "The Burial," 13,500 marks.

United States: Exhibitions, etc.—The National Academy of Design, New York, held its sixty-third annual exhibition, April 2 to May 12, with 598 entries. The sales amounted to \$22,000, for eighty-four works.

The Clarke prize for the best figure composition was awarded to H. Siddons Mowbray for his "Evening Breeze." The first Hallgarten prize, \$300, was given to G. De Forest Brush, for "The Sculptor and the King"; the second, \$200, to H. R. Poore, for "Fox Hounds"; the third, \$100, to Charles C. Curran, for "A Breezy Day." The Norman W. Dodge prize, \$300, for the best picture painted in the United States by a woman, was awarded to Mrs. Amanda B. Sewell, for her "Portrait of Dora Wheeler."

At the annual meeting of the National Academy, held in April, the officers elected were: Daniel Huntington, president; T. W. Wood, vice-president; T. Addison Richards, corresponding secretary; Albert Jones, treasurer. The following were elected academicians: E. H. Blashfield, T. W. Dewing, Walter Shirlaw. Associate academicians: George De Forest Brush, Charles C. Curran, Will H. Low, H. Siddons Mowbray, H. R. Poore, Augustus St. Gaudens, Olin L. Warner, Robert Blum, William M. Chase, Robert C. Minor.

The seventh annual autumn exhibition was held November 19 to December 15.

At the fourth annual Prize Fund Exhibition of the American Art Association, held in New York in May, the catalogue contained 388 numbers, including pictures and sculpture. But one prize, of \$2,000, was awarded to J. Alden Weir, for his "Idle Hours," a large *genre* picture which is to go to the Metropolitan Museum. Four gold medals of \$100 each were given as follows: Charles Henry Eaton, best landscape; J. C. Nicoll, best marine, "The Sea"; Percy Moran, best figure composition, "The Forgotten Strain"; O. E. Dallin, best statue, "The Indian Hunter."

The Society of American Artists held its tenth annual exhibition at the Yandell Gallery, New York, April 7 to May 5. The Seward Webb prize for the best landscape painted by an American artist under forty years of age, was awarded to J. H. Twachtman, for his "Windmills."

An exhibition of historical portraits, most of them of Philadelphia social celebrities, at the Philadelphia Academy of Fine Arts, which closed January 15, contained about 500 works. Several were attributed to Lely and Kneller; others were by Hesselius, Robert Feke, Sully, Gilbert Stuart, the Peales, Otis, and Neagle.

The American Water-Color Society's twenty-first annual exhibition was held in New York, January 30 to February 25. Two prizes, of \$300 each, one given by Mrs. Frank Leslie, for the best figure or still-life; the other by W. T.

Evans, for the best landscape or marine painted in this country by an American painter, were awarded, February 18, by vote of the members. The first was awarded to J. Alden Weir, for his "Preparing for Christmas"; the second to Horatio Walker, for his "Landscape with Pigs." The amount of sales was \$24,000.

The Philadelphia Academy of Fine Arts held its fifty-eighth annual exhibition, February 16 to March 29. The first Tappan prize (\$200) was awarded to Benjamin Fox, for his picture entitled "Sympathy"; the second Tappan prize (\$100) to M. H. Bancroft, for "Bad News." The gold medal was given to Charles S. Reinhart, for "Washed Ashore"; the silver medal to Howard R. Butler, for "La Récolte des Vareches" (Salon, 1886).

The most important art sale of the year was that of the Albert Spencer collection, on the evening of February 28, at Chickering Hall, New York. The sixty-eight pictures sold for \$284,025. The prices of some of the best works were as follow: Troyon, "Drove of Cattle and Sheep," \$26,000 (S. P. Avery). Jules Breton, "Le Soir," \$20,500 (Mrs. W. B. Ogden). Gérôme, "Serpent Charming," \$19,500. Delacroix, "Entombment," \$10,600; "Tiger drinking," \$6,100. J. F. Millet, "The Gleaners," \$10,400; "Peasant Woman and Child," \$3,500; "Diana Reposing," \$2,500; "Shepherdess," \$7,500; "Sleeping Woman," \$2,500. Meissonier, "Standard Bearer of the Flemish Civic Guard," \$9,200; "A Musician," \$8,800. Corot, "Morning," \$8,400; "Farm at Toulon," \$7,000. Daubigny, "Midsummer—Edge of a Pond," \$8,650. Rousseau, Theodore, "Sunset," \$7,800; "Autumn Evening," \$6,100; "Sunset in a Wood," \$5,000; "Ravines of Apremont," \$4,800; "Cottage at Berri," \$5,200; "Plains of Barbizon," \$1,850; "Lone Tree in Autumn," \$1,200. Fromentin, "Arab Falconer," \$6,500; "Arab Women," \$6,400; "Horse-Trading in the Desert," \$2,550; "Boar Hunt," \$3,800; "The Fire," \$1,050. Diaz, "In the Woods," \$5,900; "Assumption," \$2,650; "Passing Storm," \$4,100; "Clearing in the Forest," \$4,700. Isabey, "Fête at Hôtel Rambouillet," \$4,600. Schreyer, "Advance Guard," \$5,000.

A collection of water-colors by W. Hamilton Gibson, and of oils by Kruseman Van Elten, exhibited at the American Art Galleries from March 13, was sold March 19. The former brought \$12,259; the latter, \$8,082.

The Edward Kearney and Jordan L. Mott collections, exhibited at the American Art Galleries, were sold March 28 and 29, 130 pictures bringing \$180,590. Among the best prices obtained were: Rosa Bonheur, "Deer in the Forest," \$5,500; Bouguereau, "Resting," \$4,800; Gérôme, "Circassian Slave," \$4,800; Schreyer, "Teamster in the Marshes of the Danube," \$4,000.

The Christian H. Wolff collection, exhibited at the American Art Galleries, New York, from March 26 to April 2, was sold for about \$27,000.

The Edward F. Rook collection, sold April 5, consisted of American and European pictures, among the latter being specimens of Schreyer, Moreau, Madrazo, Hamon, Villejas, Berne-Bellecour, and Lenort. Eighty-three pictures brought \$20,715.

The Godfrey Mannheimer collection of seventy-four minor pictures, by good masters, was sold, April 12, for \$48,780. Knäus's "Blacksmith Shop" brought \$7,000.

The collection of Henry F. Chapman, Jr., sold April 12, consisted chiefly of good examples of the French schools. Lerolle's "End of the Day" brought \$3,500; Dupré's "Summer Day," \$3,225; Rousseau's "Sunshine through Clouds," \$2,500; a drawing by Millet, \$3,000. The sale brought in the aggregate \$74,395.

The collection of Herman Herzog, a German-American painter, residing in Philadelphia, consisting of 226 of his own works, landscapes and marines, sold April 25-27, brought \$16,516.

The R. S. Clark collection, and other pictures, sixty-three in all, were sold May 3 and 4, and brought in the aggregate \$39,866. The highest price was \$3,400 for Schreyer's "Wallachian Teamsters resting."

The Boston Art Club's thirty-seventh exhibition, (January 13 to February 11), consisted chiefly of portraits and landscapes.

The studio properties of Léon y Escosura, with many pictures by himself, and some attributed "old masters," sold at the Buchen Art Galleries, New York, brought in the aggregate \$116,667. Forty-one pictures by the artist sold for \$29,145; the "old masters" for \$21,117. "St. George and the Dragon," attributed to Raphael, was withdrawn for want of an \$8,000 bid.

Among the pictures exhibited in New York during the past year were twenty-one large canvases by the French painter Paul Philippoteaux, illustrative of the civil war and of Gen. Grant's career; "The Right of Way," and several cattle pieces, by Mrs. Emily J. Lakey, a pupil of Van Marcke; about a hundred pictures by the Russian painter Vassili Verestchagin, chiefly of subjects connected with the Russo-Turkish War and the Indian mutiny, and of scenes in Turkistan (previously exhibited in Vienna, Paris, London, and other European cities). Delacroix's "Les Convulsionnaires de Tanger" (*Salon*, 1838), was exhibited by Knödler & Co., and sold to W. T. Walters, Baltimore. Munkacsy's "Christ on Calvary," exhibited in New York last year, has been bought by John Wannamaker, Philadelphia, for more than \$100,000.

A bronze statue of Garibaldi, by Giovanni Turini, was unveiled, June 4, in Washington Square, New York. The figure is 8 feet 10 inches high, and stands on a granite pedestal 14 feet 6 inches high. It was erected by popular subscription by Italian residents at a cost of \$10,000.

A bronze equestrian statue, heroic size, of

Gen. Israel Putnam, was unveiled at Brooklyn, Conn., June 14.

A bronze statue of Josiah Bartlett, the first signer of the Declaration of Independence, the work of Karl Gerhardt, was dedicated July 4, at Amesbury, Mass.

The monument to Francis Scott Key, author of the "Star Spangled Banner," the gift of the late James Lick, was unveiled, July 4, at San Francisco. It is of bronze, executed in Rome by W. W. Story.

A statue of Sergeant William Jasper, the hero of Fort Moultrie in the Revolutionary War, the work of Alexander Doyle, was unveiled, February 22, at Savannah, Ga.

Among many statues and monuments erected at Gettysburg during the year was a bronze figure of heroic size, of Gen. Warren, by Karl Gerhardt.

A statue of Richard Stockton, in marble, and of Gen. Philip Kearney, in bronze, were placed, August 21, by the State of New Jersey, in the old Hall of Representatives, Washington.

A bronze statue of William H. Seward was erected at Auburn, N. Y., in October. It is by Walter G. Robinson.

A bronze statue of Longfellow, by Franklin Simmons, was unveiled at Portland, Me., September 29.

FLORIDA. State Government.—The following were the State officers during the year: Governor, Edward A. Perry, Democrat; Lieutenant-Governor, Milton H. Mabry; Secretary of State, John L. Crawford; Treasurer, Edward S. Crill; Comptroller, William D. Barnes; Attorney-General, Charles M. Cooper; Superintendent of Public Instruction, Albert J. Russell; Commissioner of Lands and Immigration, Charles L. Mitchell; Chief-Justice of the Supreme Court, Augustus E. Maxwell; Associate Justices, George P. Raney and R. B. Van Valkenburgh, who died on August 1, and was succeeded by H. L. Mitchell by appointment of the Governor. He had already been nominated to succeed Judge Van Valkenburgh, by the Democratic State Convention held in May, and was elected in November.

Finance.—At the beginning of 1887 there was a balance in the State treasury of \$255,894.63. The receipts during the year from all sources were \$535,871.65, and the expenditures \$681,120.26, leaving a balance of \$110,646.02 at the close of the year. The largest receipts were from the license tax, \$130,420.28, and the State tax on property, \$228,638.07. The expenditures include \$149,470.43 for jurors and witnesses, \$79,954, for interest on the public debt, \$70,000 for legislative expenses, \$34,581.10 for care of the insane, \$36,639 for judicial salaries, and \$21,875 for executive salaries.

There was no change in the State debt during the year, but about \$10,000 of State bonds representing the debt were added to the sinking-fund, and the same amount to the school fund. The amount of State bonds held by individuals was thus reduced from \$430,700 at

the beginning of 1887, to \$411,800 at the close. The assessed valuation of the State for 1887 was \$86,265,662, against \$76,611,409 for 1886.

Education.—The following statistics exhibit the condition of the public schools during the school year 1886-'87:

Whole number of schools, 2,103; increase over the year 1885-'86, 184. Total enrollment, 82,458; average daily attendance, 51,059; increase in daily attendance over 1885-'86, 6,246; number of white teachers employed, 1,789; number of colored teachers employed, 579; total amount of funds expended from all sources for school purposes and raised by the State and counties, \$449,299.15; number of white schools operated, 1,590; number of colored schools operated, 513; value of school property owned by the State and counties, and used in the school work, \$521,500.

The State normal colleges for each race, established by the last Legislature, were organized and opened in October, 1887, at the beginning of the school year. The one for white students, at De Funiak Springs, had matriculated fifty students during the first three months; the one for colored students, at Tallahassee, received forty students during the same time. In both of these colleges tuition is entirely free. The State also supports a flourishing agricultural college and an institute for blind and deaf mute children, in which there were twenty at the beginning of the year.

Immigration.—The people of the State have formed a State Immigration Association, to aid the State Immigration Commissioner in his work. This association holds annual meetings and elects executive officers for the year. A large meeting was held at Jacksonville in May.

Yellow Fever.—Isolated cases of yellow fever in a mild form appear to have been found at Tampa as early as the autumn of 1887. The disease survived the winter and spring at that place, and, early in the latter season, the cases becoming known to Surgeon-General Hamilton of the Marine Hospital corps, he notified Gov. Perry of the fact, and also publicly announced the existence of the disease in the State. But no heed was paid to this warning, no quarantine regulations adopted, and the statement was generally discredited. Meanwhile, during the early summer, one or more cases were always to be found at Tampa, and before August 1 the disease had appeared at Plant City, Manatee, Palmetto, and other small places in the State. There were, however, only a few patients at each place, and the facts were kept from the public prints. The first case came to Jacksonville from one of these infected localities in the last week of July; but it was not until about August 8 that public announcement of the existence of several cases in the city was made. In a few days more the disease had become epidemic, twenty-six cases appearing before August 15. About this time reports from Manatee showing that there had been twenty-three cases at that place, from Palmetto showing a number of cases, and from other places, were published. There was great excitement throughout the State, and many people living at points not

threatened, believing that the epidemic would cover the whole State, fled to the North. Jacksonville in a few days lost nearly half of its population of 80,000, and business was almost entirely suspended. An executive committee of the citizens was chosen to aid the city authorities in suppressing or controlling the epidemic, diseased persons were isolated at a hospital outside the city, infected buildings were burned, cannon were fired, a refugee camp was established, and other measures were adopted for relief. Nearly all important centers in the South quarantined against the city, and enforced their regulations strictly. Up to and including Saturday, August 18, 83 cases were reported in the city, and 5 deaths. From this time, in spite of repressive measures, the epidemic obtained a firmer hold, the number of cases reported each day rapidly increasing. Up to and including August 25 there were 91 cases and 12 deaths reported, and to September 1, 284 cases and 82 deaths. On August 28 the General Government, through the Marine Hospital service, took more open and direct control of quarantine regulations than before, by means of an order of Surgeon-General Hamilton establishing a refugee camp, to be known as Camp Perry, at which all persons from the city should be detained ten days before going to a temporary camp at Waycross, Ga., from which they might proceed northward. No trains were allowed to run from the city, except to Camp Perry, and a rigid inspection and fumigation of the mails and baggage was required. A second temporary camp at Live Oaks was established, and those at Dupont and on the Chattahoochee river discontinued. These regulations called forth a protest from the citizens, who at a public meeting on August 31 passed resolutions denouncing the action of the Surgeon-General. The latter, in a public letter, justified his course and refused to recede. Hitherto offers of assistance from outside sources had been refused; but as the infected area and the number of cases increased, the citizens found themselves no longer able to meet the exigency, and on September 5 the city authorities issued a call for pecuniary or other assistance. This was promptly and generously responded to, especially in the Northern cities. Before October 1 more than \$200,000 had been sent to the unfortunate city. The progress of the epidemic after September 1 is shown by the following figures: Cases up to and including September 8, 555, deaths 66; September 15, cases 921, deaths 117; September 22, cases 1,878, deaths 212; September 29, cases 2,547, deaths 248; October 6, cases 3,118, deaths 282; October 13, cases 3,526, deaths 311; October 20, cases 3,767, deaths 327; October 27, cases 4,043, deaths 345; November, 8, cases 4,266, deaths 361; November 10, cases 4,469, deaths 384; November 17, cases 4,601, deaths 392; November 24, cases 4,674, deaths 407; December 1, cases 4,697, deaths 410; December 8, cases 4,704, deaths

412. Few if any cases occurred after the last date, and by December 15 refugees began to return to the city. Several well-known men had fallen victims to the disease, and the loss to the business and material growth of the city was severe.

Outside of Jacksonville cases of the fever were reported, about September 7, at McOlenney, about thirty miles west of the city, where a number of deaths occurred. Ten days later, cases were found at Gainesville, and soon afterward the presence of the fever was acknowledged at Fernandina, from which place the infection had been brought to Gainesville. There seem to have been cases at Fernandina several weeks before this time. Late in the month, Sanderson was added to the list of infected places. In the latter part of October it was reported that the fever had existed at Enterprise for several months, and that 16 cases and 2 deaths had occurred.

At all these places the epidemic raged until the last of November, when hard frosts stayed its progress, although some cases occurred after that date, especially at Jacksonville. Up to December 1 there had been at Fernandina about 1,200 cases and 38 deaths; at McOlenney, over 200 cases and 22 deaths; at Sanderson, about 85 cases and 2 deaths; at Gainesville, nearly 100 cases and about 12 deaths; at Palmetto, about 45 cases; at Enterprise, about 30 cases and 4 deaths. Quarantine restrictions were removed at Fernandina on December 1.

Political.—The election of 1888 was the first under the new Constitution. Aside from the presidential contest, there was to be chosen a full set of State officers, including three judges of the Supreme Court, that body being chosen for the first time by popular election. The Democratic State Convention met at St. Augustine, on May 29, and was in session four days. There were four candidates for the gubernatorial nomination: Gen. Robert Bullock, Francis P. Fleming, Robert W. Davis, and J. G. Speer. After about twenty ballots the last two named withdrew, but a choice was not reached until the fortieth ballot, when Fleming was declared the nominee. The ticket was completed as follows: For Secretary of State, John L. Crawford; for Comptroller, William D. Barnes; for Treasurer, Frank J. Pons; for Attorney-General, William B. Lamar; for Superintendent of Public Instruction, Albert J. Russell; for Commissioner of Immigration, Lucius B. Wombwell; for Justices of the Supreme Court, A. E. Maxwell, George P. Raney, and H. L. Mitchell. The following are among the resolutions adopted:

That we advocate a liberal policy on the part of the General Government in the matter of public improvements, and hold that the South has a right to demand this until her waterways and harbors are adjusted to the needs of commerce to the same extent as other sections of the country.

That it is the duty of the State to educate its children, and that we favor the maintenance of the present liberal provisions for our system of public schools.

That the remarkable and steady growth of our population, and the enormous flow of capital seeking permanent investment in our State, is a noteworthy indication of the prosperity of the State, and that we invite worthy and industrious people from all quarters to come and settle among us, with the confident assurance of a friendly welcome, and an equal opportunity; and we heartily approve the recent establishment of a State Immigration Association, and pledge it our cordial sympathy and earnest support in its efforts to people our State with honest citizens, no matter whence they come.

That the nominee of this convention for Governor, by the acceptance of the nomination, stands pledged to regard the recommendation of the different counties of this State as expressed by the Democrats of the several counties through their party organization for that most vital and important of all positions, their county commissioners.

President Cleveland's efforts in behalf of tariff reform and civil service reform were approved, and delegates to the St. Louis convention, who were chosen at the same time, were instructed to vote for his renomination.

The Republican convention was held at Ocala, on July 31. The following ticket was nominated: For Governor, V. J. Shipman; Secretary of State, Henry W. Chandler; Attorney-General, John Egan; Comptroller, O. W. Lewis; State Treasurer, Walter Bishop; Superintendent of Public Instruction, J. K. Rainey; Commissioner of Agriculture, John P. Athorp; Supreme Court Judges, E. M. Randall, J. H. Goss, Charles Swayne.

The platform adopted contains the following resolutions upon State questions:

That we heartily favor a protective duty on oranges, lemons, pineapples, vegetables, tobacco, wool, lumber, cotton, sugar, rice, and other products of our State, that shall enable our farmers to compete against the underpaid and degraded labor of Egypt, Italy, Spain, Bermuda, and other foreign countries.

That the laws for the assessment and collection of revenue are unequal in application, and utterly unfitted to meet the wants of a growing and prosperous State. We favor a thorough revision of the whole system, so that the burdens of taxation shall be lightened, equalized, and brought into harmony with our advancing civilization.

That we favor the repeal of our present road law, compelling as it does the poor settler to labor six days every spring and fall on the public roads, while the non-resident, though he may own his millions of acres, is exempt; and we demand the enactment of a law providing for the maintenance of the road out of the funds raised by general taxation.

That we favor the public-school system, which is the offspring of the Republican party, and express our belief that it can be best nourished and perfected by its natural parent.

That the Republican party cordially sympathizes with all wise and well-directed efforts for the promotion of temperance and morality, and we indorse the principles of local option, now embodied in the Constitution of the State.

That, true to the spirit of retrogression, which characterizes the Democratic party, it has discontinued the Bureau of Immigration, which, under a Republican administration, had turned into our State a tide of immigration that brought millions of wealth within our border, and changed forests into fruitful fields.

That the Farmers' Alliance, Farmers' Union, State Horticultural Society, Sub-Tropical Exposition, and labor organizations have our full and hearty sympathy and support.

That we denounce the present Democratic Railroad

Commission. Its halting inefficiency has annoyed and exasperated the transportation companies, and utterly failed to accomplish the reform for which it was created.

That we are uncompromisingly in favor of free speech and the unrestricted right of all citizens to lawfully meet and consult together upon the political questions of the day.

That we recognize in the State militia our necessary and sole protection in times of possible riot and disorder, and that we favor liberal appropriations for its support and maintenance, and a hearty spirit of aid and sympathy on the part of the State government.

That in the counties of Madison, Jefferson, Gadsden, and Jackson we recognize a condition of anarchy and defiance of the laws of our State for the protection of the citizen in his constitutional rights, in that the citizens of those counties are prevented by intimidation and force from holding lawful assemblies, casting a ballot representing their honest convictions, and having the same fairly counted; and that we call the attention of our State authorities to this fact, and demand of them the faithful execution of their trust as a government of the whole people of the State.

The Prohibitionists held a State convention at Orlando in September, and nominated presidential electors, but voted not to present a State ticket. The canvass, which promised to be of exceptional interest, lost in a large degree its importance when the yellow-fever epidemic appeared in the State. Yet the total vote polled at the election in November was larger than in any previous election. Mr. Cleveland received 39,561 votes; Harrison, 26,657; and Fisk, 428 votes. For Governor, Fleming received 40,255 votes, and Shipman 26,485. All the Democratic candidates on the State ticket were elected, and also two Democratic Congressmen. But few Republicans were elected to the Legislature.

FRANCE, a republic in western Europe. The present form of government was proclaimed Sept. 4, 1871. The executive authority is vested in the President of the republic, and the legislative power in an assembly of two houses—the Senate and the Chamber of Deputies. The Senate is composed of 800 members, elected for nine years. They are divided into three classes, one class retiring by rotation every three years. The Chamber of Deputies is composed of 584 members, one to every 70,000 inhabitants, elected by universal suffrage under the *scrutin de liste*, which was adopted on June 16, 1885. The term of service is four years. In 1885 there were 10,181,095 electors, of whom 7,896,100 voted in the election of that year. The senators receive a salary of 15,000 francs, and the deputies 9,000 francs per annum. The President is elected for a term of seven years by a majority of votes of the Senate and Chamber of Deputies united in a National Assembly. He receives a salary of 600,000 francs, with 600,000 francs additional for expenses. The Senate and Chamber of Deputies meet every year on the second Tuesday in January, and must remain in session at least five months.

The President of the republic is Marie-François Sadi Carnot, elected Dec. 3, 1887. (For biography and portrait, see "Annual Cyclo-

pædia" for 1887.) The President, in the exercise of his executive functions, makes his decisions in accordance with the advice of his ministers, who are responsible to the Legislature. The first Cabinet after the accession of President Carnot was formed on Dec. 12, 1887, and consisted of the following members: President of the Council, Minister of Finance, and Minister of Posts and Telegraphs, Pierre Emmanuel Tirard; Minister of Foreign Affairs, Léopold Émile Flourens; Minister of the Interior, Jean Marie Ferdinand Sarrien; Minister of Public Instruction, Worship, and Fine Arts, Étienne Léopold Faye; Minister of Justice, O. A. Fallières; Minister of War, Gen. Logerot; Minister of Marine and the Colonies, François O. de Mahy, who retired, and was succeeded on Jan. 5, 1888, by Vice-Admiral Krantz; Minister of Commerce and Industry, Auguste Lucien Dautresme; Minister of Public Works, Émile Loubet; Minister of Agriculture, François Viette.

Area and Population.—The area of France is 528,572 square kilometres, or 204,177 square miles. The population on May 30, 1886, was 38,218,908, or 187 to the square mile. France is divided into 87 departments, subdivided into 862 arrondissements, containing 2,871 cantons and 86,121 communes. The number of the communes is constantly increasing.

The number of marriages in 1886 was 283,198; of births, 912,782; of deaths, 860,222. The excess of births over deaths was 52,560, as compared with 85,464 in 1885, 78,974 in 1884, 96,808 in 1883, 97,027 in 1882, 108,229 in 1881, 61,840 in 1880, 96,667 in 1879, 98,175 in 1878, and 142,620 in 1877. In Bouches-du-Rhône there were 3,114 more deaths than births in 1886; in Manche, 2,302; in Calvados, 1,946; in Eure, 1,897; in Orne, 1,863; in Seine-et-Oise, 1,823; in Rhône, 1,779. In 37 departments altogether there was a surplus of 86,189 deaths, while in the remainder the births exceeded the deaths by 88,699.

The census of 1886 included 1,126,531 foreigners who were resident in France. The foreigners in 1881 numbered 1,001,090, as compared with 801,754 in 1876. The number of Belgians was 482,265; of Italians, 240,738, against 165,318 in 1876; of Germans, 81,986, against 59,028; of Spaniards, 78,781; of Swiss, 66,281; of British and Irish, 37,006; of Dutch, 21,232; of Austro-Hungarians, 12,090; of Russians and Poles, 10,489; of Americans, including South Americans, 9,816. On Oct. 2, 1888, in response to a demand from the working-people, who considered themselves injured by the free ingress of foreign competitors, and as a rejoinder to recent regulations of the German authorities respecting the presence of foreigners in Alsace-Lorraine, the Government issued a decree imposing onerous conditions on the residence of citizens of foreign states in France. The statistics published by the Ministry of Commerce in connection with this decree show that, whereas the foreigners domi-

ciled in France constituted little more than 1 per cent. of the population in 1851, the proportion was more than double in 1876, rising to 2½ per cent. in 1881, and in 1886 to 3 per cent. The number of Italians in 1886 was 264,568, having quadrupled in 35 years. In the department of Bouches-du-Rhône they form a twelfth part of the population, numbering 70,088, while in the Maritime Alps, the department that has Nice for its chief place, there are 89,165, and in Paris 28,351. The total number of Belgians is 492,261, of whom 298,991 reside in the department of the Nord, where they constitute one eighteenth of the whole population. The number of Germans is more than 100,000, but before the war there were double that number. Nearly one third of them are in Paris. The Spaniards and Portuguese have nearly trebled since 1851, numbering now 80,842, nearly all of whom are found in the departments north of the Pyrenees and south of the Garonne. The Swiss number 78,584, of whom 27,288 inhabit the department of the Seine. The number of Dutch is 37,149, of whom more than half live in Paris. The English, Scotch, and Irish number 86,184, and of these 14,701 live in Paris. The number of natives of North and South America is only 10,253, of whom 6,915 are in Paris. These figures include persons born on French soil who have acquired citizenship in foreign countries, constituting about one fourth of the total, but not naturalized French citizens, who number 103,886, whereas in 1872 there were only 15,808 naturalized Frenchmen.

The decree of the President of the republic requires every foreigner settling in France or making a prolonged stay to make a declaration within fifteen days of his arrival at the *mairie* of the commune where he intends to fix his residence, or at the prefecture, if it is in Paris or Lyons, setting forth (1) his name and those of his father and mother, (2) his nationality, (3) the place and date of his birth, (4) the place of his last domicile, (5) his profession or means of subsistence, (6) the names and nationality of his wife and minor children, in case they accompany him. When the domiciled foreigner changes his residence to another commune, he must there make a similar declaration before the *mairie*. Foreigners residing in France at the time when the decree was published were required to comply with its provisions within thirty days. A supplementary decree extended the period to Jan. 1, 1889. Infractions of the regulations prescribed in the decree are punishable with police penalties, without prejudice to the right of expulsion, which can be exercised by the Minister of the Interior by virtue of the law of Dec. 2, 1849.

Religion and Education.—In the census of 1881, 78.50 per cent. of the population, or 29,201,703 persons, belonged to the Roman Catholic Church; 1.8 per cent., or 692,800, were Prot-

estants; 53,436 were Jews; and 7,684,906 persons refused to state their religious belief. All religions are equal by law, and state allowances are granted to those sects whose adherents number more than 100,000. In the budget of 1888, the sum of 45,743,568 francs was devoted to these allowances, distributed as follow: Roman Catholics, 43,508,723 francs; Protestants, 1,551,600 francs; Jews, 180,900 francs; Mussulmans, 216,840 francs; administration, etc., 291,000 francs.

Public education is under the supervision of the Central Government. In 1885-'86 there were 85,887 elementary schools, 63,207 of which were lay schools, and 22,680, clerical schools; 70,813 were public and the rest private schools. The total number of pupils was 6,274,568, of whom 4,988,758 were educated in the public schools. The number of teachers in the elementary schools was 135,216 in 1886—88,668 in the lay, and 46,548 in the clerical schools. In November, 1884, there were 881 secondary schools, with 98,495 pupils. There were 87 normal schools for males and 75 for females in 1886. Education is provided for adult males in 6,667 communes, and for adult females in 1,135 communes, the total number of pupils in 1885-'86 being 167,798 males and 30,036 females. The number of graduates at the state universities in 1884 was 12,195. In that year 8,307 students were in attendance at the faculty or University of Paris. There are also numerous technical, industrial, and other special schools. In the budget of 1886-'87, the total sum devoted to educational purposes was 94,497,000 francs, of which sum 81,460,000 francs were for primary and 13,037,000 francs for intermediate education. For the 16 schools of letters and philosophy, 14 of law, and 6 of medicine, the sum of 11,709,214 francs was assigned in the budget. The state faculties of theology were abolished in 1885. The Protestant faculties at Montauban and Paris have, however, been continued by annual votes of the Chambers, because they are the only legal training-colleges for the pastors of the two Protestant state churches, whereas the Catholic faculties were not recognized by the bishops as training-schools for priests.

Commerce and Industry.—The total special commerce of France in 1887 amounted to 7,590,546,000 francs, of which 4,270,772,000 francs represent imports, and 3,319,774,000 francs, exports. The most important class of commodities is that of alimentary substances, comprising wines, cereals, fruits, animals, coffee, sugar, etc., which were imported to the amount of 1,600,387,000 francs, and exported to the amount of 721,175,000 francs. Of raw products, including wool, raw silk, oils, skins and hides, cotton, and lumber, the imports were valued at 1,998,836,000 francs, and the exports at 717,387,000 francs. Of manufactured articles, including woolen, silk, and cotton goods, leather and leather goods, machin-

ery, metal goods, arms, etc., the imports were 552,091,000 francs, and the exports 1,693,567,000 francs. Of miscellaneous products, the value of the imports was 119,458,000 francs, and that of the exports, 187,645,000 francs. In the total foreign commerce of France for 1886, amounting to 7,456,900,000 francs, exclusive of specie, the imports amounted to 4,208,100,000 francs, and the exports to 3,248,800,000 francs. The imports of coin and bullion were valued at 443,517,878 francs, and the exports at 333,262,342 francs. The transit trade amounted to 585,000,000 francs in 1886.

The trade of France with other countries in 1886 was, in millions of francs, as follows:

COUNTRIES.	Imports from—	Exports to—
Great Britain	525	855
Belgium	419	443
Spain	893	173
Germany	885	297
Italy	309	193
United States	298	293
Argentine Republic	228	110
British India	193	8
Russia	170	10
Turkey	124	46
Algeria	124	189
China	119	4
Switzerland	108	210
Austria	107	14
Portugal	74	23
Brazil	53	57

The number of silk-culturists in 1887 was 136,388, against 136,706 in 1886. In 1886 there was imported into France 154,994,874 kilogrammes of sugar, while the home manufactured sugar amounted to 412,161,821 kilogrammes. The product of wheat in 1886 was 290,000,000 bushels, and in 1887 it was 322,000,000 bushels. The yield of wine in 1886 was 692,584,728 gallons; in 1887, 586,000,000 gallons. In 1887 232,800,000 gallons of wine were imported, and 48,114,000 gallons exported. In 1886 the live-stock in France included 2,911,392 horses, 13,104,970 cattle, 22,616,547 sheep, 1,483,000 goats, and 5,681,088 swine. The number of persons who were gaining their livelihood by agriculture in 1882 was 6,918,000, which was four per cent. less, as compared with the total population, than in 1862. The total number of agricultural holdings was 5,672,007, of which 2,167,667 were under 2½ acres, 2,635,030 between 1 and 25 acres, 783,641 from 25 to 125 acres, 56,866 from 125 to 250 acres, 20,644 from 250 to 500 acres, 7,942 from 500 to 1,250 acres, and only 217 larger than 1,250 acres. The number of owners of land was 4,885,246, which was 405,269 less than in 1862, a part of the decrease being accounted for by the transfer of Alsace-Lorraine, with 187,000 land-owners to Germany. Nearly 80 per cent. of the cultivators are owners of their farms, 14 per cent. are tenants, and 6 per cent. are *metayers*, dividing the profits with the landlord, who furnishes the land and the capital. The number of proprietors had increased, and the number of tenants and *metayers* had decreased in twenty years.

Navigation.—In 1886, 100,796 vessels of all descriptions were entered at French ports, having an aggregate tonnage of 18,490,692. Of this number, 79,112, of 9,994,889 tons, sailed under the French flag. The number of vessels cleared during the same year was 102,386, of 19,023,334 tons, of which 80,151, of 10,868,362 tons, sailed under the French flag.

In 1885 there were engaged in the French fisheries 85,915 men, with 23,877 vessels. The value of the fishery product was 51,469,080 francs. In January, 1887, the mercantile navy consisted of 14,100 sailing-vessels and 951 steamers. The sailing-vessels had a tonnage of 492,807, and their crews numbered 74,129 men. The steamers had an aggregate burden of 500,484 tons, and employed 12,790 men.

Railroads.—The railroads of France in January, 1888, had a total length of 32,248 kilometres. The state is the owner of only 2,597 kilometres, and does not operate more than half of its lines. The receipts of all the railroads in 1887 were 1,021,424,230 francs, against 1,007,137,227 francs in 1886. The gross receipts of the state lines are estimated at 30,084,000 francs, and the expenses at 25,203,000 francs. During the fiscal year 1887-'88 the Government built 791 kilometres of additional railroads.

Telegraph and Postal Service.—On Jan. 1, 1885, there were 86,868 kilometres of telegraph lines, with 258,202 kilometres of wire. In 1885 were sent 23,091,360 telegraph messages, 21,150,444 of which were inland, and 1,940,916 foreign.

The number of letters and postal cards forwarded in 1885 was 679,145,983; of journals, 413,981,388; of samples, circulars, etc., 433,024,173.

The postal and telegraph receipts in 1885 were 166,578,653 francs, and the expenses 134,424,235 francs. The telegraphs have been worked at a loss to the treasury ever since the Government telegraph service was established in 1851.

Finances.—The estimated revenue for the year 1887 was 3,184,836,415 francs, and the expenditure 3,138,731,289 francs. The budget for 1888, presented in February, 1887, calculated the ordinary revenue at 3,253,583,188 francs, derived from the following sources: Indirect taxes, domains, and state monopolies, 2,778,829,689 francs; direct taxes, 474,753,494 francs. The estimated ordinary expenditure is 3,253,104,738 francs, the principal heads being: Ministry of War, 694,934,530 francs; Ministry of Marine, 219,883,811 francs; Ministry of Public Instruction, 133,048,190 francs; Ministry of Public Works, 176,046,604 francs; other ministries, 256,322,445 francs; expenditure on the public debt, 1,337,275,671 francs; administration and salaries of the President, senators, and deputies, 845,860,097 francs. The extraordinary expenditures, balanced by receipts from special sources, were 473,605,181 francs for the home office, treasury, and other special votes, and 83,796,200 francs for special state expenses.

Of this latter amount 82,870,000 francs went to the account of state railways, 13,064,700 francs for naval invalids, 9,807,500 francs for the national printing-office, 16,867,100 francs for the legion of honor, and 9,221,600 francs for the savings-bank. In June, 1887, the budget for 1888 was cut down by 182,205,000 francs, leaving the corrected expenditure, ordinary and extraordinary, 3,628,301,069 francs.

The total consolidated debt of France amounted in 1888 to 23,728,096,228 francs, the interest upon which is 826,241,181 francs annually, divided as follows: 3-per-cent. *rente*, 482,984,911 francs; 4-per-cent. *rente*, 446,096 francs; 4½-per-cent. *rente*, 305,426,874 francs. The redeemable debt, life annuities, and other engagements of the treasury swell the capital of the debt to about 82,500,000,000 francs. All the communes and departments of France have their own budgets and debts. The total communal receipts in 1887 were 470,183,297 francs and the departmental receipts, 97,286,261 francs. In the budget of the city of Paris for 1888 the revenue and expenditure were made to balance at 304,169,794 francs. The principal source of revenue of Paris is from the *droits d'octroi* or tolls on articles of consumption, estimated to amount to 187,738,200 francs in 1888. The interest and sinking-fund of the municipal debt, amounted to 106,189,058 francs in 1888.

In order to sustain the increased expenditure of the Government in recent years the import duties have been made much higher than they were formerly, the stamp duties have been raised, and taxes on sugar, wine, and salt, and that on railroad transportation, have been increased. On March 13, 1888, the Chamber decided to take away the privilege that wine and apple growers have enjoyed of distilling spirits from their own produce free of duty. The imposition of new duties on live animals caused a large falling off in the cattle imports in 1887, while the import of fresh meat increased. The duty on wheat was raised in March, 1885, and again on April 1, 1887, causing a considerable advance in the price of bread. In September, 1888, the bakers at St. Ouen and St. Denis refused to make bread at the prices fixed by the municipal authorities, and the Cabinet met to consider the question of suspending the grain duties, as it is empowered to do when the price of bread rises to a point threatening the food-supply of the people. One effect of the high duty on wheat was that Belgian bread was imported and sold in Paris in large quantities.

The Army.—The peace strength of the French army in 1888 was 499,789 officers and men, and 118,927 horses. This does not include the gendarmerie and the Garde Républicaine, which together amount to 25,922 officers and men. With these included, the effective, deducting the number absent on sick-leave and furloughs, was 465,588. The nominal force provided for in the budget for 1888 was divided as follows:

CLASSES OF TROOPS.	Officers and men.
Staff.....	3,999
Schools.....	3,087
Administrative and medical.....	3,898
Infantry.....	804,937
Infantry, administrative.....	14,105
Cavalry.....	70,824
Artillery.....	73,221
Engineers.....	10,930
Train.....	11,840
Gendarmes.....	22,725
Garde Républicaine.....	3,300
Total.....	525,711

The territorial army numbers 87,000 officers and 579,000 men. The total war force of France is about 3,750,000 men, of which number 2,500,000 have received some military instruction. The expenditure for the army in 1888 was 694,984,530 francs.

The Navy.—The effective navy in 1888 consisted of 393 vessels, comprising 17 line-of-battle ironclads, 9 ironclad cruisers, 10 ironclad *guarda costas*, 4 ironclad gun-boats, 9 battery cruisers, 9 first-class cruisers, 15 of the second, and 18 of the third class, 2 torpedo cruisers, 14 avisos of the first, 26 of the second, and 6 of the third class, 13 transport avisos, 6 torpedo avisos, 20 gun-boats, 40 sloop gun-boats, 10 sea-going torpedo-boats, 72 first-class and 41 second-class torpedo-boats for coast defense, 5 pontoons, 25 transports, and 22 sailing-vessels. The "Caiman" and the "Terrible," sister-ships to the "Indomptable," belted ships with 19½ inches of compound armor at the water-line, carrying 75-ton guns mounted *en barbette* in two fixed towers, are practically completed, and the "Requin" is approaching completion. The "Admiral Baudin," a monster ironclad of 11,200 tons displacement with 21½-inch plates at the water-line, armed with three 60-ton and twelve smaller guns, and the "Formidable," a sister-ship, were completed in 1888. The "Hoche" and the "Neptune," of 10,500 tons, and the "Marceau," a heavily armored steel cruiser with four barbette towers, having three full decks, and fitted with four torpedo tubes, will be ready for service by 1890. Two first-class ironclad squadron vessels, four first-class ironclad gun-boats, four armored gun-boats of the second class, two battery cruisers, two torpedo cruisers, eleven cruisers of various classes, and a large number of first-class torpedo-boats are in different stages of construction. Another first-class ironclad and two torpedo dispatch-boats will be begun in 1889. Before the end of that year one first-class and four third-class cruisers will be finished, and three first-class, one third-class, and the two torpedo cruisers are expected to be done the year after. The expenditure on the navy set down in the budget for 1888 is 219,883,311 francs. The valuation of the fleet given in the budget is 502,000,000 francs.

Fall of the Tirard Ministry.—The Cabinet was overturned on March 30 by a vote of 268 to 234 on a motion of M. Laguerre, leader of Gen. Boulanger's faction, which numbered only 18 in the Chamber, in favor of the revision of the Constitution. Royalists and Bonapartists

supported the motion from their different standpoints, and were joined by the followers of M. Clémenceau, now an opponent of his cousin Boulanger, whom he first lifted into power, yet committed to the principle of revision. The changes of Government have invariably been produced in recent years by such a temporary combination of the greater part of both the Royalist parties with the Radicals for the sake of overturning an Opportunist Ministry, or with the Opportunists in order to oust one that is dominated by the Advanced Left. The Chamber in 1888 was divided into seventeen separate factions, viz., the Legitimists, whose Pretender is Don Carlos or Don Jaime; the Fusion Legitimists, under the Duc de la Rochefoucauld; the Philippists, who have accepted the manifesto of the Comte de Paris; the Compromise Royalists, represented by Baron de Mackau and M. Piau; the Victorian Bonapartists; the Jeromist Bonapartists; the Bonapartists pure and simple; the Left Center, led by M. Ribaud; the Opportunists, whose leader was Jules Ferry; the Advanced Left, under M. Brisson and M. Goblet; the Radicals, under M. Floquet and M. Clémenceau; the Extreme Radicals, of whom M. Millerand was the chief; the Old Convention School, led by M. Madier de Montjau; the Possibilists, under M. Basly and M. Camélinat; the Boulangists, who had a spokesman in M. Laguerre; the Rational Radicals, led by M. Maret; and the Anarchists, who had now an able representative in Parliament, Félix Pyat, elected by the great constituency of the Bouches-du-Rhône.

The Floquet Cabinet.—The President of the Chamber, M. Floquet, who had undertaken to form a cabinet in May, 1887, but had failed, again accepted the task when called upon by President Carnot. He was then thought to be a stumbling-block in the way of the coveted alliance with Russia, because he once shouted *Vive la Pologne* in the presence of the Czar Alexander II, but a show of courtesy by Baron Mohrenheim, the Russian minister, had removed that disqualification. The list was not completed till April 8, as M. Loubet, who agreed to retain the portfolio of Public Works, and M. Ricard, who accepted that of Justice, found that they could not agree to the revision paragraph of the ministerial declaration, and withdrew. As finally constituted, the Cabinet was composed as follows: President of the Council and Minister of the Interior, Charles Floquet; Minister of War, Charles de Freycinet; Minister of Foreign Affairs, M. René Goblet; Minister of Marine and the Colonies, Admiral Krantz; Minister of Finance, Posts and Telegraphs, M. Peytral; Minister of Public Instruction, Fine Arts, and Worship, Edouard Lockroy; Minister of Public Works, M. Deluns-Montaud; Minister of Justice, M. Ferrouillat; Minister of Commerce and Industry, Pierre Legrand; Minister of Agriculture, François Viette.

The Premier was an advocate in Paris and a prominent Republican during the empire, joined the Commune, was a deputy in 1871, resigned when unable to effect a reconciliation between the Government and the Commune, became president of the Municipal Council, re-entered the Chamber in 1876, and acted with the Extreme Left; was appointed Prefect of the Seine by Gambetta in 1882, and worked in complete harmony with the Municipality until he was compelled to resign because of his sympathy with the autonomist demands of the Parisians, was elected a deputy in October, 1882, and was chosen President of the Chamber when M. Brisson became Premier in 1885. He presided over the Chamber with dignity and impartiality, rebuking the Radicals for wishing to oppress their colleagues when they moved to hold a session on Good Friday, and openly condemning the vote in favor of revision. The Cabinet was one of the Radical Left, to which group MM. Floquet, De Freycinet, Goblet, Lockroy, and Viette belonged, while M. Peytral was a member of the Extreme Left, and recently the sponsor of Félix Pyat before the electors of Marseilles, who returned that Socialist to the Chamber by a large majority. The other three civilian members were Moderate Liberals. The War Ministry was given to M. de Freycinet because he had always coveted that portfolio, having held it in the Provisional Government of 1870, and having fallen out with Gambetta because it was refused him by the latter. The selection of a civilian, and especially a statesman so volatile and fond of innovation, was viewed with distrust, as was also the appointment to the Foreign Office of M. Goblet, who when Premier had joined Gen. Boulanger in a plan for a military demonstration in connection with the Schnaebely affair, which was vetoed by President Grévy.

"Republican concentration" was the watchword of the new Government. The ministerial declaration was non-committal in regard to the questions of separation of church and state, Paris self-government, and the progressive income tax; and in regard to constitutional revision the Government asked to be intrusted with the duty of indicating the propitious moment to begin a work of such importance, which was destined to place the political organization in complete harmony with republican principles. A bill was promised with reference to associations as a preliminary to the definite regulation of the relations of church and state. Among the financial measures to be considered, was a scheme for remodeling the liquor and the succession duties. The bills to augment the military forces, that had passed the Chamber and were to be considered by the Senate, were described as a means of securing the respect due to the nation, and as a guarantee for the maintenance of peace, calculated to prepare conditions favorable to the celebration of the centenary of 1789.

Proceedings of the Chambers.—In the first ballot for a President of the Chamber to succeed M. Floquet, M. Brisson received the most votes, the others being divided between M. Clémenceau, leader of the Extreme Left, and M. Andrieux, ex-Prefect of Police. The latter withdrew, and M. Clémenceau led on the second ballot. On the following morning, when the voting was resumed, the Moderates put forward M. Méline, ex-Minister of Agriculture and leader of the Protectionists, as their candidate, but M. Brisson refused to retire, which made the vote a tie between Méline and Clémenceau, giving the election to the former by right of seniority in age.

When Parliament re-assembled after the Easter holidays, M. Floquet said that the Government desired strength to deal with pretenders, whether draping themselves in the flag or speaking in plebiscitary enigmas, and on being challenged to say whether revision, that is, the Radical scheme of the election of the Senate by universal suffrage, were postponed indefinitely, asked the Chamber to wait until the call for revision ceased to be a Royalist snare or a cloak for conspiring dictators. The order of the day was then carried by 379 to 177 votes.
